COUNTRY NEWSPAPERS.—A Copy of every Provincial Newspaper published is regularly filed at Deacon's Coffee and Chop House, 3, Walbrook, near the Royal Exchange, London; also the *Gardeners' Chronicle*, and a great variety in Scientific and Literary Intelligence, London and Country Directories, &c. Advertisements punctually inserted in every London and Country Paper. Good Beds provided.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d „ 24 „ „ „
1st „ 18 „ „ „
2d „ 36 at the Botanical Gardens, Hull, Sept. 2d;
2d „ 12 „ „ „
1st „ 24 at the Hortical. Soc., Scarborough, Sept. 3d;
1st „ 12 „ „ „
1st „ 6 „ „ „
1st „ 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st „ 36 „ Botanical Gardens, Sheffield, Sept. 15th;
1st „ 36 „ Horticultural Soc., Barnsley, Sept. 21st;
1st „ 24 „ „ „
1st „ 48 „ Botanical Gardens, Leeds, Sept. 22d;
1st „ 48 „ Horticultural Society, York, Sep. 24th;
2d „ 24 „ „ „

Besides having taken other Prizes in addition to the above.

PREMIER.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10s. 6d.

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10s. 6d.

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10s. 6d.

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant*.

GARDEN NETS, Fishing Nets, Sheep-Nets.—Woollen and Worsted Netting, various widths; New Hemp Net, very small mesh, Bunting, &c., for protecting blossom of Fruit-trees; New Herring Fishing Net, 1½d. per yard; Old Herring Fishing Net, 3d. Fishing Nets of all kinds, from 4 to 400 yards long; Tarred Rabbit Fence Net, 2d. per yard; Sheep-folding Net (strong tarred cord), 4½d. per yard, 3 ft. 6 in. high; New Expanding Tents for Lawns, erected and taken down in one minute, 12 ft. by 12 ft., circular shape, 6 ft. high in the lowest part, price 5*l*.

Robert Richardson, 21, Tonbridge Place, New Road, near Euston-square.

TO PINE-GROWERS.

TO BE SOLD by Private Contract, by order of the Assignees of James Bishopp, of Westburton, a Bankrupt, ONE THOUSAND SUCCESSION PINE PLANTS of all sizes, and One Thousand very fine Fruiting Pine Plants. N. B.—There will be about Four Thousand Pine Plants of all kinds, with the Pits, to be sold by auction in August next. Application to be made to Mr. Henry Satter, Auctioneer and Surveyor, Arundel; or to John Mann, the Gardener at Westburton, near Petworth, Sussex.

TO BE DISPOSED OF, (in consequence of the death of the late Proprietor,) an extensive and highly-respectable NURSERY and SEED BUSINESS, in one of the most fertile of the Midland Counties, which has been established and has possessed a first-rate connexion for nearly 50 years. The arrangements for conducting the business are unusually advantageous and complete.—For particulars apply to Messrs. Warner and Warner, Seedsmen, 28, Cornhill, London.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and OTHERS.—Messrs. PROTHEROE and MORRIS have received instructions to offer to public competition by Auction on the premises, on TUESDAY, the 5th of April, 1842, at 11 o'clock, the celebrated Stock of GREENHOUSE PLANTS, late the property of —— Daubauz, Esq., deceased, near the church at Leyton, comprising fine specimens of Camellias, Oranges, Hybrid Rhododendrons, Ericas, choice Geraniums, Acacia, Azalea indica, Cactus, Neriums, Myrtles, Eutaxia, &c.

May be viewed by cards; Catalogues may be had of the principal Nurserymen and Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

CARNATIONS, PICOTEES, HEARTSEASE, PINKS, DAHLIAS, AND FUCHSIAS.

MESSRS. PROTHEROE and MORRIS are instructed to sell by Public Auction, at the Mart, Bartholomew Lane, on THURSDAY, March 31st, at 12 o'clock, (in consequence of the situation being required for other purposes) the genuine Stock of about 200 pairs of choice Carnations and Picotees, 300 pairs of first-rate Pinks, choice Heartsease, Dahlias, and about 50 new Fuchsias, including Moneypenii, Belliana (white), Stewartii, Curtisii, Splendens, &c., the property of Mr. Henbrey, a well-known florist. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

GREENHOUSES ON LEAD FLATS.

To the Editor of the Gardeners' Chronicle.

315, Oxford Street, March 10th, 1842.

SIR,—I should be glad to make it known to your Correspondent "J. D." (March 12th), and to others who have houses in confined situations to which lead flats are attached, that I have erected a Conservatory, in a precisely similar situation, upon a somewhat novel plan, which has answered admirably. The advantage of making such an addition to houses like those in Connaught-terrace is very great. It converts an unsightly object for the back front to an elegant purpose, and in the winter effectually protects the house from fog and frost. I believe if it were known with how much ease and cheapness such glass rooms might be put up, their adoption would be general.

I would willingly give your Correspondent an estimate of one suitable to his house. I am, Sir, yours, &c.

JOSEPH DRAKE.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing: upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner, a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass supplied in any number or quantity, at wholesale prices.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions, and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand-Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler, (for a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

CUCUMBER and MELON BOXES and LIGHTS—For Sale, one, two, and three light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom: two Light Boxes and Lights complete, from 1*l*. 8*s*. Garden Lights made, glazed, and painted, from 1*s*. per foot. Sashes and Frames made, glazed, and hung complete, 1*s*. 8*d*. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent Road.

PUNCH; or, the LONDON CHARIVARI!—A Number of this popular Work appears every Saturday, price Threepence. The part for March will be published on the 30th instant, containing 44 pages of closely-printed matter, and upwards of 70 illustrations, by Leach, Crowquill, Newman, Henning, and other eminent artists. Price Thirteenpence, neatly stitched in a wrapper. Vol. I. may still be had, price 7*s*. 6*d*., and all back numbers are always kept on sale.

"In the *London Charivari* we find no language that can be held offensive even by the most refined mind—no lurking innuendo to shock female delicacy."—*Post Magazine*.

"We at once recommend the reader to go and purchase the work, not only as one of the cleverest, but cheapest, that at present issue from the press."—*Sheffield Iris*.

Office, 13, Wellington-street, Strand.

HOOKER'S NEW AND RARE PLANTS, with 50 plates, 8vo, 14s.,

ICONES PLANTARUM; or, Figures, with brief descriptive characters, and remarks, of new or rare plants selected from the author's herbarium. Vol. I., Part I., New Series, or Part 9 of the entire work, containing 50 plates. By Sir WM. JACKSON HOOKER, K.B., LL.D., F.R.A. and L.S., &c., Keeper of the Royal Botanic Garden, Kew.

Also, continued Monthly, price 2*s*. 6*d*., No. 4, for April, containing 56 pages of text, and two plates, of the

LONDON JOURNAL of BOTANY, being a New Series of the Journal of Botany. By Sir W. J. HOOKER, K.B., LL.D., F.R.A. and L.S., and Director of the Royal Botanic Garden, Kew.

London: H. Baillière, foreign Bookseller to the Royal Society, and the Royal College of Surgeons, 219, Regent-street.

IMPORTANT TO LANDLORDS AND TENANTS.

Just published, price 1*s*.

ADVICE TO FARMERS HOW TO DOUBLE THEIR CROPS by NEW FERTILIZERS, to secure luxuriant Vegetation by Nutritious Steeps for Seeds, to prevent the ravages of Worms, and to detect frauds and defects in Seeds and Manures.

Sold by Longman and Co.; and by the London wholesale and retail Agents; Gifford and Linder, 104, Strand; Whalley and Co., Liverpool; Toole and Mackay, Dublin; and by all Booksellers and Seed Merchants.

Just published, in 2 vols. 8vo. cloth, price 24*s*.

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum*.

"This very industrious and interesting work."—*Examiner*.

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas*. Edward Moxon, Dover-street.

Publishing Monthly, with Four coloured Engravings,
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY. The Number for March, 1842, contains beautifully-coloured figures of *Ipomœa ficifolia*, *Fuchsia radicans*, *Iris bicolor*, and *Columnea Schiediana*, with Woodcuts illustrative of the habit of of the first and last, and copious descriptions, history and directions for the culture of each: also Papers on the science of Gardening, No. 2, in which Vegetable Developments are treated of, and an Engraving is given to show an Oak germinating in water; the Importance of Shortening the Shoots of Exotic Plants, while in a Growing State; the treatment of Hydrangea hortensis as a border-flower; on Exposing Greenhouse Plants in Summer; Notices of new and beautiful Plants figured in the leading Botanical Periodicals for February, as well as of those in flower in the suburban nurseries; with an ample Calendar of Operations for March.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS. The Committee of this institution hereby give notice that, in conformity with the resolution of the General Meeting of the Subscribers, which was holden at the Crown and Anchor Tavern, Strand, on the 13th of January last, and in consequence of the death of John Grier, an election of THREE PENSIONERS will take place on Thursday, the 2d of June next, at the Crown and Anchor Tavern, Strand, at one o'clock precisely.

Feb. 1st, 1842. J. J. BOWLER, Hon. Sec.

The testimonials of Candidates must be forwarded to the Secretary (at the latest) by Saturday, the 2d of April next. Copies of the Rules and Lists of Subscribers may be obtained of all the Members of the Committee; and of the Secretary, Albany-road, Kent-road.

*** Subscribers sending Post-office orders are respectfully requested to make them payable to the Secretary at the General Post-office, St. Martin's-le-Grand.

A. DEAN'S PATENT.—Emigrants' and Domestic FLOUR MILL, to grind as fine and as soft as French Burr Stones. No. 3, price 3*l*. 10*s*. is strongly recommended for trial.

Corn and Cake Crushers, Malt and Oat Rolls, and Turnip Cutters. Farmers' Meal Mills, for hand power, or to attach to Thrashing Machine Gear. Wind, Water, and Steam Flour Mills, self-acting or otherwise; so constructed that the stones may be arranged on each side, or in the centre of the building, with any number of stones, on the ground floor. Hand Mills, with French Burr or Grey Stones, with or without Dressing Machines attached. French Burr, Grey, and Flintshire Stones, and Patent Dressing Machines. Patent Archimedian Presses for Oil and Packing; pressing Skins and Leather; making Cider and Cheese; and for Printers, Bookbinders, Paper-makers, &c. Steam Engines, and every description of Mill Work.

Manufactory, Pershore-road, Birmingham. Drawings and Prices forwarded by post.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

All Fellows who shall apply on or before Tuesday, the 5th of April, may obtain for these Exhibitions, at the rate of *Three Shillings and Sixpence* each, any number of Tickets not exceeding Twenty-four. After the 5th of April any further number of Tickets will be delivered to Fellows, on their personal application or written order, at the price of *Five Shillings* each Ticket. Each Ticket will be available for the admission of one Visitor, after One o'clock, to either of the Three Exhibitions, at the option of the Visitor. All applications for Tickets must be made at the Society's Office, 21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, MARCH 26, 1842.

MEETINGS IN THE ENSUING WEEK.

Friday . . . . . . Botanical . . . . . . 8 P.M.

To the remarks lately made on the value of ammoniacal liquor as a manure for grass land and the farm, (p. 139 and 155,) we must add a few observations on its beneficial application to the successful cultivation of a garden.

Every good gardener knows the value of decayed vegetable matter, or leaf-mould, as it is commonly termed, and the importance and difficulty of destroying the various insects which readily breed in this compost. We have good ground for believing that an adequate supply of the former and the desired destruction of the latter is within the means of every person.

The natural manure of the forest, and of all plants in their native state, consists principally in the nourishment derived from the successive strata of fallen leaves, which afford by gradual decomposition the substance upon which the plants themselves feed, (vide pages 163 and 763,) aided by the occasional assistance of salts formed from decomposed animal matter, of which ammonia is one of the chief ingredients, and by the absorption from the atmosphere of various chemical agents with which decomposing vegetable matter readily combines.

Taking nature, therefore, for our guide, under ordinary circumstances, the decayed stems and leaves of plants themselves are principally instrumental to the general purposes of healthy existence and reproduction. But although this view of the state of nature may be correct, yet in gardens where it is an object to concentrate in a comparatively limited space the varied beauties of many thousands of acres distributed over every known region of the globe, artificial assistance for the adequate supply of food is as much required as to an army marching through a country where a native population thinly scattered provides only sufficient food for its own support.

Acting, then, on this principle, collect all the stems and leaves of the plants from the flower-borders, the trimmings of edgings and vegetables, the mowing of the grass and the weeds, and put them in a heap, adding occasionally a little mould in layers over the vegetable matter as it accumulates. Mould that is taken from pots, with the fibres of roots, when plants are repotted, answers the purpose. About the beginning of October, soak the heap by means of a watering-pot with a rose, with the ammoniacal liquor; then add to the heap any refuse that may be cleared away, such as the remains of Dahlias, and other autumn flowers; and after that is done, soak it in the same way again.

It will be found that the effect of the liquor so applied is the complete rotting of the leaves, and that the stems are partially destroyed. In January the heap may be turned over, and the coarser stems put aside, but the principal part may be spread upon the borders, and left there until the spring has advanced, when it should be forked in, by stirring the surface of the ground only, after the plants begin to show themselves, and not before; we say not before, because many plants are destroyed by digging, raking, and trampling upon flower-borders, which a careless gardener *always attributes to the effect of the previous winter.*

By this treatment vegetable mould may be obtained during the year, which, under the ordinary process, would require three years for its adequate decomposition, and the ammonia absorbed by the vegetable matter in its decomposition gives that additional stimulus which many plants in a garden require in a more natural state, than that in which the stronger excitement of the coarser and more forcing manure is generally applied to them.

Having thus shown how vegetable mould may be obtained in any garden, however limited, where the ammoniacal liquor can be readily procured, we must now state that the effect of the liquor applied as above is the immediate destruction of every insect, worm, snail, slug, grub, or chrysalis contained in the heap; even woodlice, so difficult to kill, are instantly destroyed.

In the application, however, and in the result much will depend upon the strength of the liquor employed, which varies according to circumstances; and that procured from most of the smaller gas-works in the country is generally so variable in its degree of strength from water, by drainage and otherwise, being mixed with it, that it may be difficult to ascertain the true value of the plan here recommended, unless the liquor itself was proved to be of the proper strength.

It is of consequence in all cases to put the liquor on the heap as soon as practicable after it is procured, and to expose it as little as possible to the action of the air during the interval; for, although, by exposure to the air its powers of fertilisation do not appear to be diminished, its causticity is much impaired.

We propose in a future Number to give the standard strength of the liquor to be used, and we are not without hope that a proportion of it, mixed with water, may be found to be sufficiently strong for the complete destruction of insects, while the luxuriance of plants in a growing state may be promoted by its being applied to them.

Of the very great value of artificial manures no one can entertain a doubt; and in our opinion it is to them more especially that the cultivator has to look for bringing his land to the highest possible state of fertility. But while the experimentalist is busying himself with nitrates and sulphates and hydrocarbonates, with geine, creine, apocreine, humus, or whatever else the ingenuity of chemists may distinguish in the shapeless and unsightly substances on which fair Nature feeds her verdant offspring, it would be the height of folly to neglect the materials necessarily formed at each man's door. The absurdity of sending ships to Peru for nitrate of soda, to the Pacific for guano, and to Spain for phosphate of lime, so long as the equivalents of such substances immediately within our reach are unexhausted, is, one would suppose, sufficiently apparent. And yet this occurs continually in practice. We throw away our home-made materials of Agrarian wealth, and run to the antipodes to recover them.

The agricultural and horticultural worlds are, however, now arousing themselves from their lethargy; and on all sides an anxious desire is evinced to economise and turn to profit everything containing those organisable materials which serve for the nutriment of plants. How much importance we attach to such endeavours will have been perceived by the space we have allowed for their explanation and discussion. We last week inserted M. Schattenmann's process for improving the quality of stable manure; and we now invite attention to a paper on Ammonia, which will be succeeded by others on the same subject, by the author of those valuable papers on Rural Chemistry which last year excited so much interest among our readers.

ON THE USE OF AMMONIA AS A MANURE.

Recent chemical experiments on the composition of manures have shown that the greater number of them contain ammonia; all kinds of refuse animal matter give it out when they are undergoing decay, and hence all kinds of manure which consist, either wholly or in part, of decomposing animal matters, evolve ammonia. Ammonia, in its pure and separate state, is a gas, readily soluble in water, and well known by its strong pungent odour. It has a strong affinity for acids of all kinds, and has a great tendency to enter into combination with them, forming salts which, like pure ammonia, are readily soluble in water, but which, generally speaking, do not possess the pungent smell and caustic powers of that substance; the alkaline properties of the ammonia being neutralised by the acid with which it has combined. The ammonia which is given off during the decay of animal matters, meeting with carbonic acid in the air, combines with it, and the result is carbonate of ammonia; hence manure contains carbonate of ammonia.

It has been found that the greater number of the substances constituting the food of man are nutritious in proportion as they contain nitrogen; and that Wheat, for example, containing much nitrogen, is more nutritious than that which contains but little. Now, if this be true, and if the value of crops depends greatly on the quantity of nitrogen which they contain, it is surely of great importance to study the sources whence plants derive that substance, and to ascertain the best methods of supplying them with as much of it as they require, in that form best adapted to their mode of absorbing it. The great leading fact on which this supposition is based is this—most of the vegetable substances which constitute the food of man contain nitrogen, and are valuable in proportion to the quantity of that substance which they contain; and in support of it we have another fact, namely, that the best manures, such as dung and farm-yard litter, all contain nitrogen, and are useful in proportion to the quantity of it which they contain, and the state of combination in which it exists in the manure. It is not enough that the manure contains nitrogen, but it must contain it in such a form that it can be absorbed by growing plants, and rendered available towards their growth and nutrition; and the form of nitrogen best suited for this purpose seems to be that in which it is combined with hydrogen, to form ammonia.

It is very certain that no one substance alone can constitute a manure suited to all plants and applicable to all soils. A slight examination of the composition of good manure must soon convince us that its effects are dependent on several causes; that plants require different matters from the soil, and that the use of manure is to supply those matters necessary to the growth of plants in which the soil is deficient. The chemist, or rather the thinking agriculturist, has, therefore, to consider what are the ingredients proper to be added to the soil he is cultivating, what quantity is required, which is the most economical mode of applying them, and how they should be added to produce the most beneficial results. Without going deep into the general theory of manures, or the special modes in which they act, let us consider briefly the sources and application of ammonia. The careful experiments of chemists have proved that the air at all times contains traces of this substance; we know that it is formed whenever animal matters decay or putrify, and likewise, in smaller quantities, when combustible substances are burnt; these and many other sources are constantly adding ammonia to the air, whilst, on the other hand, in consequence of its ready solubility in water, it is constantly being washed down to the surface of the ground by rain and dew. Here, then, we have one source whence the soil, and consequently the plants growing in it, derive nitrogen. Again, there are innumerable tribes of animated beings which are constantly adding animal matter to the soil during life, enriching it with their excrements, and when dead leaving their bodies to decay in it, and thus at all times evolving ammonia in the soil. These natural sources of ammonia, though sufficient for ordinary vegetation, are generally not equal to the large quantity required by a well-cultivated crop, and accordingly it is necessary to add to the soil substances containing ammonia, or capable of evolving it during their decay; such substances are manures. The farmer says he manures his land with dung; but the chemist is not satisfied with this, but endeavours to find out what there is in the dung which promotes the growth of plants; and he comes to the conclusion that one of the principal substances is the ammonia evolved during its decay. Having ascertained this point, he naturally goes a step further and says, if the ammonia be one of the most valuable constituents of manure, it is probable that there are other, and, perhaps, cheaper modes of manuring land with it than by applying dung; and, also, as ammonia is volatile, is not a large quantity of the best part of the manure liable to be lost? These are questions to be decided by experience, but they are very important, and well deserve careful attention and impartial trial.

There are many processes in the arts in which large quantities of ammonia are formed and suffered to escape as useless; it is sufficient now to mention one, namely, gas-making, in which immense quantities of ammonia are formed and condensed in the purifiers, constituting what is called ammoniacal liquor. This is one of the many sources of ammonia at present neglected, which, if our views are correct, might be applied with great success to promoting the growth of plants. In experiments of this kind there are several things to be attended to. The ammonia of the gas-liquor is, to a considerable extent, in a caustic state; it is true that it is in great part converted into carbonate, but still it has very decided caustic powers, and besides has a great degree of volatility. There are, therefore, two objections to the use of this liquor in its raw state as a manure; the one being its causticity, which would cause it to burn and corrode growing vegetables; and the other its volatility, in consequence of which it would evaporate and become weaker when exposed to the air; thus much of its goodness would be wasted. It is probable that both these objections might be overcome if we were to add to the ammoniacal liquor just enough of any acid to neutralise its caustic powers and convert it into a fixed salt, or, at least, into a compound far less volatile than ammonia or its carbonate. The question, therefore, is, how are we to fix or neutralise caustic volatile ammonia so as to form a salt which shall be free from the objections attendant on the use of ammonia itself, and yet possess all the fertilising powers of the alkali? This will be the subject of inquiry next week.—*E.*

† ENTOMOLOGY.—No. XXVI.

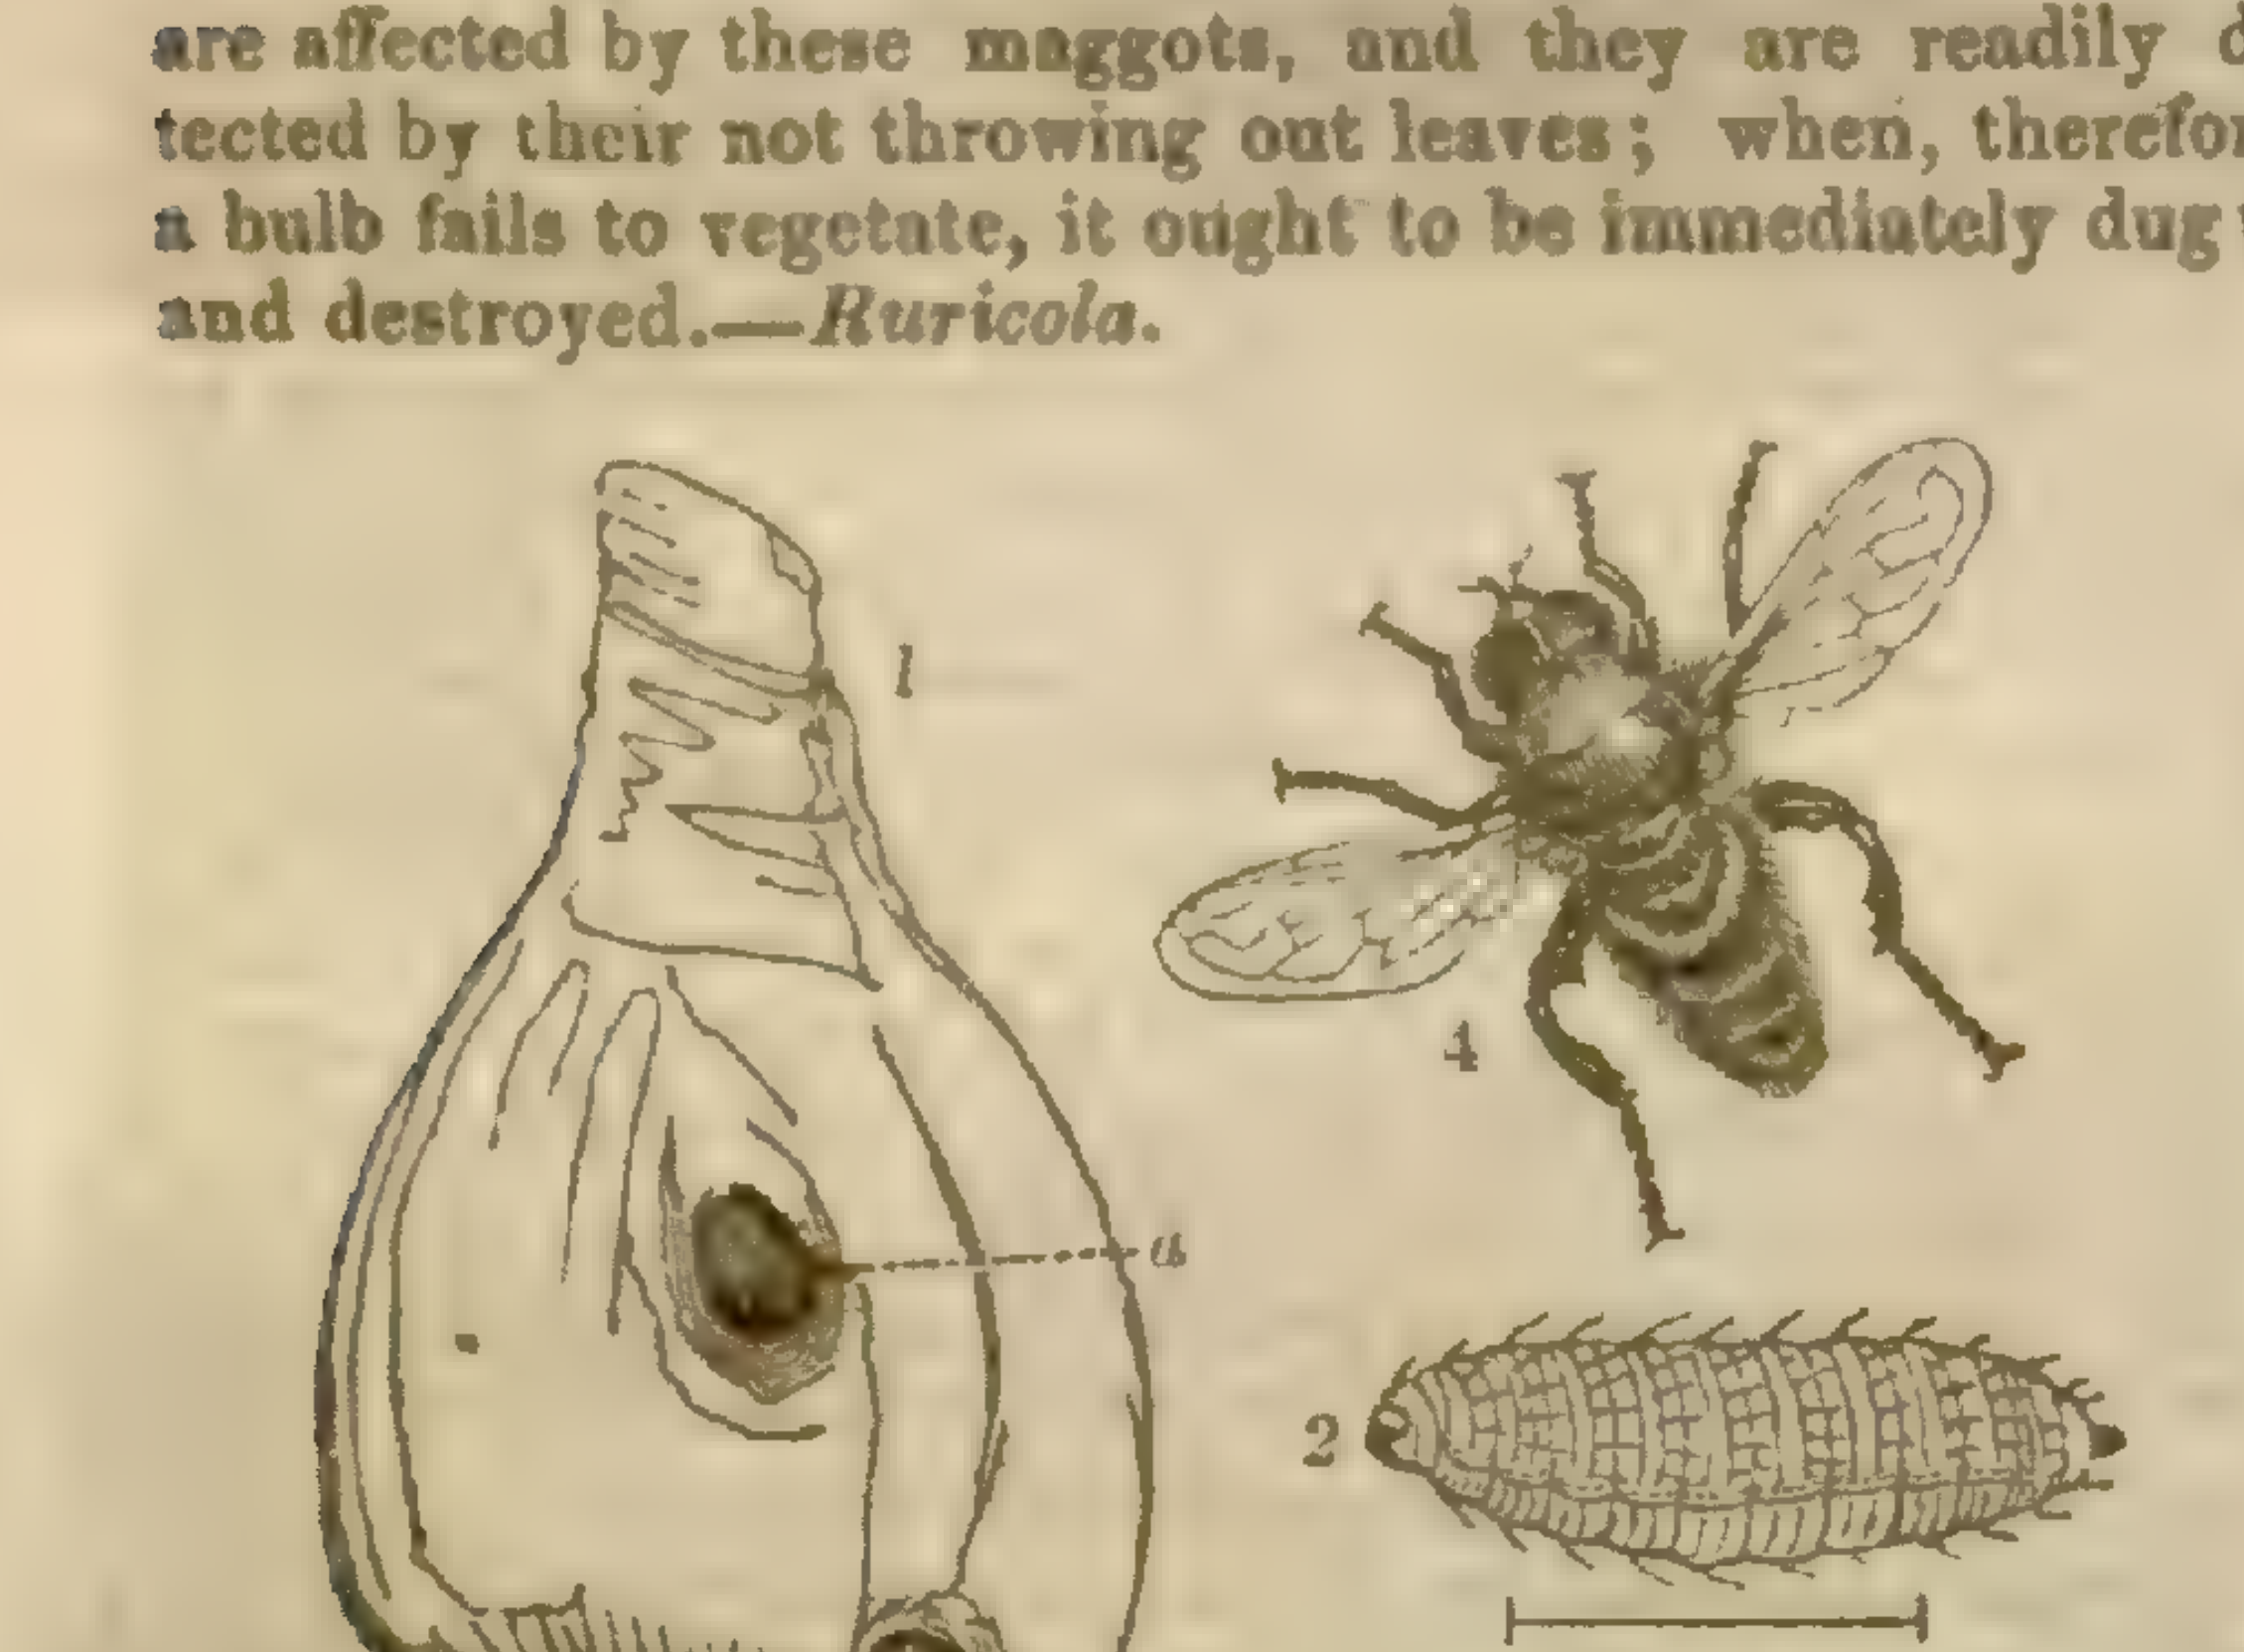
The Narcissus-fly, called *Merodon Narcissi.*—The Daffodil having formed a subject for familiar botany in a recent Number of the *Gardeners' Chronicle*, the history of a fly whose larva feasts upon the bulbs of the Narcissus may not prove uninteresting. In the month of Nov. one or two large roundish holes (fig. 1, *a*, *b*) are sometimes found on the outsides of the bulbs of these flowers which are more or less decayed within, where a maggot will generally be found, which, by feeding in the heart during the summer and autumn months, has been the sole author of the mischief. This larva is somewhat like the flesh-maggot, and not unlike a bot, only that it is not serrated with spines, and instead of being whitish, its natural colour is changed to brown by its living amongst the slimy matter which has been discharged from its own body, causing the gradual rotting of the bulb. When in repose its shape is elliptical, both ends being rounded and nearly similar; but as soon as it begins to move, it thrusts out its head, at the extremity of which are two strong black hooks for scraping the bulb, which thus supply the food for the nourishment of its inhabitant; the whole body is conspicuously wrinkled, and each segment is furnished with a transverse row of hairs, inclining backward (fig 2). Towards the end of November, the maggot is transformed into a pupa; to accomplish which it eats its way out of the bulb near the roots (fig. 1, *b*), and buries itself in the surrounding earth. The pupæ are dull brown, elliptical, rough, and strongly wrinkled (fig 3); at the head are two projecting spiracles, and the tail is similar to that of the larva; in this state they remain until the following spring, when the flies issue from their tombs; their eggs are then deposited, but upon what part of the plant they are laid has not been observed, but probably upon the bulb near the base of the leaves. April seems to be the month when most of the flies hatch, and they have been compared to small humble-bees from the disposition of the colours, which are, for the most part, yellow, orange, and black, but they certainly bear a greater resemblance to some of the bots: from bees they are readily distinguished by having only two wings; the horns and proboscis are totally different, and they have no stings; and the neuration of the wings varies greatly from the Œstri, or bots.

Bouché having bred four species, described by Meigen, namely, Merodon equestris, nobilis, transversalis, and Narcissi, from the same bulbs, the specimens exhibiting every shade of difference, he is convinced that they are all varieties of one insect; I have, therefore, represented a male of Fabricius's.

M. equestris.—It is very deep black; the lip is large; antennæ with the third joint pointed, producing a short naked bristle; face yellow, with hairs; eyes pubescent, covering the head excepting a small space on the crown where the three ocelli are placed; the thorax is large; the anterior portion and scutel are clothed with short yellow hairs, leaving an intensely black shining band between them, forming, as it were, a saddle; abdomen rather narrow, tapering, thickly clothed with yellow hairs, excepting the second segment, which is blackish; thighs hairy, stout, hinder incrassated, with a blunt tooth beneath and near the apex; tibiæ short, hinder stout, curved, with two tubercles on the inside, one at and the other near the apex, the outer angle producing an incurved spine; tarsi broad and 5-jointed, hinder the longest; claws strong; pulvilli tawny (fig. 4); length six and a half lines; expanse one inch. Female with the eyes remote.

M. clavipes, another Fabrician species,[*] and M. Narcissi, have been found in this country; two males of the first having been captured by the late Dr. Leach many years since, in Spitchwick-park, Devon; and one of the latter was caught a few years back in a garden at Southgate, the end of March or beginning of April. Whether the maggots infest our native Daffodil, the Narcissus Pseudo-Narcissus, is very uncertain; but should they ever be detected in their bulbs, however such a discovery may alarm the lovers of this classical tribe of plants, the British entomologist, influenced by very opposite feelings, would be charmed to add such a prize to his English Diptera. There is not, however, much chance of either, for in the northern countries of Europe, the Merodon is believed to have been transported in the larva state from the South of France, Spain, and Italy, and it appears that on the Continent its attacks are confined to the Narcissus niveus. There are, however, several species of these flies which inhabit France, and the M. clavipes is far from uncommon in that country, where I have found it; and M. equestris I caught at Claremont, in Auvergne.

At Berlin, a considerable number of the Italian bulbs are affected by these maggots, and they are readily detected by their not throwing out leaves; when, therefore, a bulb fails to vegetate, it ought to be immediately dug up and destroyed.—*Ruricola.*



CULTIVATION OF THE NEAPOLITAN VIOLET.

As these plants are such general favourites, especially with the ladies, and their flowering so well with me in winter excites surprise in some persons, the following simple mode of management may not be unacceptable. In the spring, about April or May, the old plants are divided, and the runners, &c., put into small pots, with some leaf-mould in the compost (of which they are very fond). As soon as well rooted, they are placed on the north side of an espalier or hedge, and are occasionally watered in very dry weather; no farther care is requisite till autumn. About the beginning of October they should be moved to a sunny place; an empty Melon-pit or cold frame would suit best; and about Christmas transferred to the front of the greenhouse, or the window of a sitting-room, with air every fine day. By having a number in pots a succession may be kept up from Christmas to Easter, and probably the London nurserymen and market-gardeners might find it worth their while to supply them in this way. If any flower-buds show themselves early in summer, it is best to pick them off; and shifting into larger pots in November is also useful to promote the flowering. The plan is not new, and goes, as will be observed, merely upon the principle of inverting the seasons. It is difficult to make the same plants flower twice within the year, which accounts for the failures of some persons in forcing them.—*C. D.*

CULTIVATION OF ORANGES AND LEMONS IN THE COLDER PARTS OF ITALY.

IN the *Gardeners' Chronicle* for Oct. 2, 1841, is a communication of some interest on the cultivation of Lemons, &c., at Mr. Brigstock's, in Pembrokeshire. As the same objects of cultivation are attempted, with various success, by persons living in favoured spots in other parts of South Wales, Cornwall, Devonshire, and perhaps the Isle of Wight, and might be tried in the south of Ireland, possibly a short account of the artificial mode of cultivating Lemons and Citrons in the colder parts of Italy may be acceptable.

The cultivation of Agrumi (under which general term the Italians class the whole genus Citrus and its varieties) is, in Italy, confined to the valleys or lowlands near the coast; and a journey from any town on the coast into the interior will show the different degrees of hardihood of the sorts cultivated, by the gradual disappearance of the tender kinds as you approach the mountains. The most striking proof of this is, that at Florence, and similar situations, the only sort that will resist the winter, and bear fruit in the open air, is the Seville Orange, there called Arancio forte, or selvatico, or simply Arancio, with its varieties Arancio turco (variegated), and the narrow or Willow-leaved. In the same gardens where the Seville Orange stands out-of-doors, and bears (though not abundantly), the Lemon (Limone), the Citron of commerce (Cedrato), and the Sweet Orange (Portogallo) must be kept under cover, with a few other curious varieties and species of Citrus. The Lemon and Citron, of which latter there are several varieties, and of which the best is specially called Cedrato di Firenze, are the sorts chiefly grown for profit; the Sweet Orange not bearing fruit of good quality under artificial treatment. There are two methods of growing the trees practised in the gardens of Florence, that of tubs and that of walls; neither is much like what is to be seen in England. The tubs are not made of wood as with us, but though very large, are entirely of baked earthenware, well ornamented in relief, and, with fine trees in them, have a handsome appearance. They are made of a peculiar clay dug on the banks of the Arno between Leghorn and Florence. When the trees are seen to have well filled the tubs with roots, the tree itself, with its ball of earth, is carefully heaved out of the tub by a sort of crane; the roots are pruned, or rather sheared, two or three inches deep all round, and replaced, if a large tree, in its old tub; if small, in a larger one. The sides are filled in with rich earth, wine-scourings, &c.; a low wall of clay is made round the edge, and the roots are abundantly supplied with water.

The wall system is as follows:—The Lemon-trees, instead of being kept pruned close back to the wall, like our fruit-trees, are allowed great freedom of growth, so as to retain much foliage, which is no injury to the ripening of this sort of fruit. The trees being planted in the natural soil, require little care in summer, except watering and manuring, and such pruning as may be indispensable. But in winter they are carefully protected after the following manner, which might be adopted in England, where show or beauty is not required. In the autumn a framework of wood is constructed three or four feet in front of the wall, along its whole length, and closed at the ends, where, however, there is an entrance-door for the gardener. The interstices of the framework are filled with what may be called cushions of straw or reeds, very closely made, and perhaps six inches thick, confined and kept in shape by split rods which are bound across them. These cushions are so contrived that when set up at night or in severe weather they make a perfectly even wall of reeds, with a small wood or thatch roof connecting them with the stone wall at top. But in the daytime, when sun and air are to be admitted, every alternate cushion is taken down, or lowered by a cord, so as to show a row of windows along the straw wall, which, as every cushion or shutter is moveable, may be varied every day, so that all the plants may get their due share of light in turn.

In the villas round Florence large quantities of fine fruit are raised in this manner, and it is remarkable that the crop is secured, although the appearance of the trees, when the covering is finally removed in spring, is usually very shabby. The leaves and young shoots, in particular, suffer, but not the fruit. However, climate soon recovers them.—*S.*

AMATEUR'S GARDEN.—No. XIII.

EVERY one who delights in the cultivation of his garden is anxious to possess new things, providing they are ornamental or useful. Some of the best of our new hardy fruits were, therefore, pointed out and described at page 157, and at this seed-sowing season it will perhaps be interesting to do the same thing with flower-seeds and vegetables. Amongst the former, Brachycome iberidifolia, with its masses of deep blue flowers, is extremely interesting and beautiful; the seeds should be sown in light peat soil, and placed in a mild bottom-heat; it does well for bedding out in the flower-garden. There are two species of Portulaca, one named splendens and the other Thellusonii, which have much larger and more showy flowers than the older kinds; they require to be raised in the same way as the last, but must either be kept in the greenhouse or planted out in a very warm border. Lobelia ramosa is a fine greenhouse annual from Swan River, which is covered with blue flowers. Among the more hardy kinds are several species of Balsams (Impatiens) from the North of India; their names are rosea, glanduligera, macrochila, tricornis, and candida. They are rather coarse for beds in the flower-garden, but look well in shrubberies; some of them, such as the latter, have a noble appearance when grown in pots in the greenhouse or conservatory. Lupinus Hartwegii is one of the prettiest of its race, producing large spikes of flowers all the autumn until destroyed by the frost. Erysimum Perofskianum, with its spikes of sweet-scented orange flowers, makes a fine bed, and should be in every collection. Cosmanthus fimbriatus is now to be had from the seedsmen, and will be found well worthy of being grown. Besides these, there are Campanula Loreyi, Calandrinia discolor, and Calliopsis Drummondii, which should be added to every collection where they do not already exist. It ought to be recollected that this list is only intended for such as are acquainted with the older kinds but who wish for something more new, because many of the old ones are as fine, and, perhaps, finer than these. We cannot expect to have any more beautiful than such as Nemophila insignis, Collinsia bicolor, and Clarkia pulchella.

With regard to vegetable seeds for the kitchen-garden, the following have been proved to possess sufficient merit to be recommended:—Peas—the Auvergne and Groom's superb dwarf blues: the former is one of the best kinds which are grown, and is of a medium size; the latter is one of the best dwarf sorts. Beans—Marshall's early dwarf prolific is an excellent early variety. Cabbages—the Pomeranian and Portugal; the stalks of the leaves of the latter are eaten like Sea-kale. The dwarf prolific Broccoli is a good spring kind, and has the advantage of growing in a smaller space than many of the others. Knight's Protecting is also a good spring sort. The Violet Celery and the new flat-stemmed white solid are both good kinds. The white Paris Cove Cos Lettuce and the red Castelnaudary Beet are both excellent of their kind; and for those who are fond of large Rhubarb, Myatt's Victoria will answer their expectations; this also forces well. Some of the market-gardeners grow excellent kinds of the more common vegetables, such as Cabbage and Cauliflower, and are very particular in saving good seed.

It may be worth while to guard the amateur against uncovering any of his tender plants too soon, as we may still have sharp frost, and, what is perhaps worse, cold and cutting winds. Peach and Apricot trees also, which are coming into flower upon walls, may be slightly protected.—*R. F.*

HOME CORRESPONDENCE.

Transplanting Evergreens.—As there appear to be various opinions respecting the best season for transplanting evergreens, I beg to offer a few remarks on the success with which I have transplanted many varieties at different seasons for the last 16 years. From August till May few of those that were moved with good balls, planted carefully and well watered, have ever failed; but in a loose, sandy soil, where it was impossible to raise a ball, or when evergreens were purchased at a nursery, I always found the months of September or October decidedly the best. In the autumn of 1839 I moved some large Arbuti, Bays and common Laurels, from a loose soil, without a particle of it attached to the roots; in two months after an hydraulic pipe was required to be laid in the ground where these were planted. When turned out of their new situation, I was agreeably surprised to see an abundance of rootlets making way for the future sustenance of the plant, which would be firmly established before the summer. I am satisfied if those large shrubs had been removed late in the spring or summer, with their roots exposed to the rays of a hot sun, not one in twenty would have lived; therefore it is only with extraordinary balls, and much caution, that late spring or summer planting should be recommended. The opinions of Messrs. Townley and Errington on this subject were very satisfactory and conclusive. I also found large forest-trees to move with more certainty of success in the autumn than in spring; but they should be well staked, to prevent strong winds from shaking them.—*P. Keane, Lismore Castle, Waterford.*

Temperature of Orchidaceous Plants.—From the remarks made on Aspasia Epidendroides, in the March No. of the "Botanical Register," I am induced to send you the following account of a plant which has flowered in these gardens, under what may now be termed the cool treatment. The temperature after falling as low as 40° in winter, was never above 55° of fire, and 63° sun-heat, with a free circulation of air every fine day; the bulb acquired a length of five inches, bearing two flower-scapes, one of which, with 12 flowers, measured eight inches, clear of leaves, the other having 10 flowers, all expanding at one time. I may also take this opportunity of naming a few of the plants which grow most luxuriantly in the above temperature:—Lælia superbiens (the only circumstance under which it has made roots), Barkeria elegans, Epidendrum Skinneri, and rhizophorum, which last has made fine wood, above nine inches in length.—*J. Brewster, Gardener to Mrs. Wray, Oakfield, Cheltenham.*

Fertilisation of Cucumbers.—Although Cucumbers and Melons are classed as monœcious plants, I fancy I have frequently seen them produce hermaphrodite flowers. In 1840, while in charge of the Framing department in an extensive garden, I attached (perhaps erroneously) considerable importance to artificial impregnation; so much so, that during wet weather, I removed male flowers into a dry atmosphere, that the anthers might thus be enabled to discharge their pollen, which cannot be effected when the air is very damp. On the 16th of Aug. the fruit-room contained 90 Melons, and I cut during the season upwards of 200. I may, however, be mistaken in supposing impregnation necessary, or that hermaphrodite flowers are sometimes produced. Were the female blossoms upon strong healthy plants examined where the temperature is kept low, I am certain anthers without filaments would be found attached to the stigma. As I profess to have but a very superficial knowledge of Botany, I trust the female flowers will be minutely investigated by those more competent to discern the presence of anthers than—*Thos. Cowan.*

[*] Curtis's Brit. Ent. pl. 98.

The Water Wagtail.—A pair of Water Wagtails had built their nest in a Yew, which, with one opposite it, formed an arch over a brick walk from the lawn to the yard; there, in the beginning of last summer, they brought up their young ones. It was very pretty to see them as soon as they could fly hopping about, without any sign of fear, on the lawn close to the before-mentioned walk, where people were passing all day long. Having brought up those, and no doubt affectionately consigned them to the air, the same pair built their nest, about August in the same year, in the same nest, and just in the former manner. They were often looked at and their young ones watched, but they never seemed to fear; until, at last, one day they were not there, and their nest was torn. They (the parents) are very often coming into the verandah and tapping at the windows, even when there are no flies to attract them; their reason for this I cannot tell.—I also send you the following account of Camomile, as I wish to know whether it is true or not:—"Not only decoctions, or the leaves dried and powdered, of the common Camomile (Anthemis nobilis), will destroy insects, but nothing contributes so much to the health of the garden as a number of Camomile plants dispersed through it. No greenhouse or hothouse should be without Camomile, in a green or in a dried state; either the stalks or flowers will answer. If a plant is drooping and apparently dying, in nine cases out of ten it will recover, if you place a plant of Camomile near it."—From the "Irish Garden Mag." —*A Scribe at Woodend.* [The writer in the "Irish Garden Mag." was born at Castle Blarney, we suspect.]

Slugs and Clubbing in Cabbages. — Some inquiries having lately been made respecting the best method of getting rid of slugs, and also the cause of clubbing in the Cabbage tribe, I beg to give you the following as my experience on those subjects. When I went to the Duke of Portland as gardener in 1832, I found that I could not grow any crops of the Cabbage tribe that were fit to appear at table; everything of the kind being eaten at the roots by a white maggot, and the ground being overrun with slugs as well. I however soon destroyed grubs of all sorts, by the application of burnt clay, the refuse of a timber-yard, or any rubbish near at hand. As soon as the litter was sufficiently burnt to ashes, and cooled so as not to burn the barrows, I had it laid over the cleared ground, from an inch to two inches thick, immediately after lightly pointing it in, and then put in my crops. There was no appearance of clubbing afterwards, and the roots were perfectly clean, and the crops were as fine and luxuriant as any one could desire. The soil, which before was cloggy, soon became so mellow as to astonish the workmen who had been there years. The burnt material had all the good properties of our magnesian lime, without any of its bad ones. By the application of recently-slaked magnesian lime, sown at night, while all the slugs were abroad, I soon exterminated them. But the best and neatest method is to have a tank, or large tub, and after the lime has been slaked, put it into the tank, in proportion to the extent of the ground requiring its application. Throw water over the lime in such a quantity as to render it when settled clear and caustic. Stir all well together, and in a few hours it will be sufficiently clear, and then it should be drawn or laded off for use into another vessel. In the course of the day, lay slates, tiles, boards, or large leaves of any kind, over the ground where slugs or worms frequent, and on the following morning let one man turn over the slug and worm traps, whilst another person with a small pot sprinkles the lime-water over the slugs as the traps are turned up, and in a short time they will all be as dead as if boiling water had been poured over them. To the discerning horticulturist it is well known there are two separate sallies of slugs during the night: one comes out in the evening, and another towards morning; those who are desirous of destroying the whole as soon as possible, must have recourse to the quicklime system, and choose a calm night for the purpose; let the lime be sown over the ground about 9 or 10 o'clock at night, and again between 3 and 4 in the morning. It only requires a slight sprinkling to destroy the slugs, which will be found dead next day in all directions, where there is not the least appearance of the finest dust having fallen. If it is to be effectually done, not a nook should escape the hand and eye of the operator; and if so, no galvanic batteries are needful.—*John Mearns, F.H.S.*

Greenhouse Lights.—It is very often the case that at this season when the lights are taken off houses for painting, they are left in damp sheds and outhouses quite unfit for their reception, which rots the wood and often occasions a deal of broken glass. The damp causes the wood to swell, and when they are put on the houses they fit tight, and require hammering down, by which glass is broken. On the contrary, if kept in a warm situation, they go on easily, which renders the glass less liable to be broken.—*W. Payne.*

On the Culture of Gladioli in the open Air.—Some of the remarks in the paper on the culture of Cape Gladioli in p. 171 appear to differ so widely from the experience of a successful cultivator of that beautiful genus, that I am inclined to think the following extract will be acceptable to many of your readers. It is from the Treatise on Crosses and Hybrid Intermixtures appended to the Hon. and Rev. W. Herbert's valuable work on Amaryllidaceous Plants, p. 365. "The hybrid Gladioli, of which a large portion are sufficiently hardy, flower about the same time as the Roses, and contribute quite as much in general effect to embellish the garden by their fine colours and profusion of bloom. They succeed very well in the natural soil of the garden at Spofforth, which is a good yellowish light loam suitable for barley; and also in the artificial borders of peat and sand, where, however, in a dry summer they stand more in need of water. These hardy crosses are between G. cardinalis, blandus, carneus, inflatus, angustus, and tristis; and they vary with every shade of colour from white to scarlet, rose, coppery, and blackish purple; and some are exquisitely speckled in consequence of the cross with tristis. They succeed best when grown into a thick tuft, in which state the profusion of blossom is admirable, the cluster of bulbs and the old skins of decayed bulbs permitting the wet to drain away, and preventing the earth from lying too close and heavy on the bulbs in autumn and winter. Clusters have now stood undisturbed at Spofforth above 10 years, with the precaution of covering them with leaves from November to March or April. There is danger in disturbing and parting them, for numbers will rot if reset separately; and if they must be divided, it is best to do so in April; or, if it be done in the autumn, the roots taken up should be potted and turned out again in the spring. The beautiful crosses with hirsutus, recurvus, and versicolor are more delicate plants, and do not succeed well in the border. . . . Seedling Gladioli will often flower the first autumn; the best treatment is to sow the seed in pots, and give them shelter till the seedlings are pretty strong, and then turn out the ball unbroken into the border, where they will produce a crowded nosegay of flowers of various shades of colour." From my own experience I may remark that the tenderer sorts alluded to in the above extract arrive at a high degree of perfection if potted about 12 in as small a pot as will hold them, late in the autumn, and planted in a warm border in May: they will require to be shifted once in the early spring, but should not in the first instance be put in a large pot; as, if the soil is good, they will have plenty of nourishment, and the closer they are planted, the more beautiful will be the appearance of the clump when in bloom. One of the most beautiful species, and which is not mentioned by your correspondent "G.," is that sold by the trade under the name of floribundus.—*A Constant Reader.*

Nitrate of Soda.—Connected with the subject of applying salts as manure, is the inquiry as to how soon they effect their object, either by operating some chemical change or being taken up by the plant—and then how soon they melt and pass down into the earth beyond the reach of the plant. I considered this an important subject of inquiry, and addressed you upon it; but neither you nor your correspondents considered the inquiry worth a notice. I suggested that experiments should be made with different earths, either in tubs or otherwise, to ascertain the rate at which the salts descend, &c., as from your own statements it appears an important subject, both as regards the time of application and the quantity each time applied. I hope you will give the points I have noticed your consideration.—*Totty.*

Christmas Rose.—Perhaps some of your readers are not aware the length of time the flower of the Christmas Rose will last in water. If kept away from the fire, a bunch of these will last from six weeks to two months without dropping a leaf. I have been in the habit of having a nosegay of these flowers for many winters. I have occasionally seen it potted in the autumn, and by putting it either in a cold frame or greenhouse without fire, you insure that the blossoms are not injured by slugs or the extreme cold weather. I know few more beautiful flowers than a bunch of well-blown Christmas Roses.—*Totty.*

English Elms and Holly.—At the entrance-gate of East-end Farm in the parish of Charlton Kings, near Cheltenham, is a singular specimen of this tree. The circumference one foot from the ground is 31 feet, 20 feet from the ground 25 feet; extreme height of the trunk, 40 feet. This old veteran, with its numerous knots protruding in all directions, will cover 30 men in a standing position; and looking upwards to the height of 40 feet on the south side, you may almost fancy a magnificent rock standing above you. This old tree has a companion on the opposite side of the gate measuring near the ground 22 feet in circumference, and about the same height, and apparently in a more perfect state. These mutes have stood at this gateway, as near as I can trace, between 300 and 400 years. Approaching the house is the farmer's favourite tree, where his poultry roost. It is a beautiful common Holly, 4 feet in circumference near the ground, with a trunk, at 9 feet high, 3 feet 9 inches in circumference. The extent of the branches is 18 feet, with a fine pyramidal head covered with its beautiful red berries. This verdant tree forms a very pleasing contrast at this season to its leafless neighbours. Those of your readers who visit Cheltenham will find it a pleasant ride to drive by and see those old Charltonians.—*R. A.*

Gardening in Mines.—I have travelled many a mile in my lifetime in order to ascertain the truth of a thing, but I will not require to go to the Duke of Hamilton's coal-pit at the Redding, and yet I think I shall be able to satisfy "I. H. S." about the growth of Potatoes in coal-pits. Some years ago I frequently went down the coal-pits at West Plean and Bannockburn, and received geological lessons from the vast volume of Nature. Wandering through the old workings where the fresh currents of air were not circulating, we met with an agreeable temperature; I found by the thermometer that the heat was sufficient to force Rhubarb and Seakale in the winter and spring months. I got ready some large roots of Rhubarb and placed them about 30 fathoms below the surface of the earth. The person who accompanied me was a member of the Horticultural Society in this place; he planted some Potatoes among the shale, in order to have early Potatoes at the first meeting of the society. The Potatoes did not answer the purpose intended; they produced long blanched shoots and a few small watery tubers about the size of marbles, such as may be seen in spring when a Potato-pit is opened. The Rhubarb grew very well, and I gathered stalks between 3 and 4 feet long. There was no shale put about the roots; the place was very dry, and they were sometimes watered during the time they were growing. As might be expected, the second gathering was much weaker than the first, and they continued to increase in weakness until the plants died. Since the forcing of Rhubarb and other plants that require blanching could be done at so little cost, I have sometimes thought that extensive subterranean gardens might be formed in the old workings of our coal-fields, where Rhubarb and other things might be grown by the acre, and have the markets as well supplied in winter with these articles as with Cabbages at Midsummer. These gardens might not be so beautiful to look upon as the garden of the Hesperides, where, we are told, the trees produced golden fruit; but they would require no dragon to guard them, and yet they might yield a golden harvest to market-gardeners who were in the way of supplying the public with such productions as would grow in them. It would also be turning the internal heat of our planet to some useful purpose.—*Peter Mackenzie.*

The Double Yellow Rose.—In 1831 I saw a fine Double Yellow Rose in the garden of Manar, Aberdeenshire. The gardener said it was the largest plant of the sort in Scotland; but that I cannot vouch for. It was trained on a wall with a south-west aspect, and the soil in which it grew was naturally poor, but liberally supplied with manure. The plant extended nearly 8 feet at the bottom, and 13 feet at the top, and was annually cut down to the top of the wall, which was 9 feet high. It had flowered freely every season for many years. The situation is high, and rather exposed.—*James Alexander, Carton Gardens.*

Double Yellow Rose.—A great deal having been said about the Double Yellow Rose, the following extract from a work called Dictionarium Rusticum, 8vo, 3rd edition, 1726, may not prove uninteresting to your readers. "The Double Yellow Rose bears not so well when thus natural, nor in the sun, as other Roses do, but must be placed in the shade; and for its better bearing and having of the fairest flower, first, in the stock of a Frankfort Rose put in the bud of a single Yellow Rose near the ground; that will quickly shoot a good length: then slip into it a bud of Double Yellow Rose of the best kind at about a foot high in that sprout. Keep suckers from the root, as in all other inoculated Roses, and rub off all the buds but of the desired kind. When big enough to bear, prune it very near the preceding winter, cutting off all the small shoots, only leaving the bigger, the tops of which are also to be cut off as far as they are small. When it buds for leaves in the spring, rub off the smallest of them; and when for flower, if too many, let the smallest be wiped off, leaving as many of the fairest as the strength of the tree will bring to perfection, which should be a standard, not set by a wall, and rather shaded than in too much heat of the sun, and watered some times in dry weather, by which means fair and beautiful flowers may be timely brought forth."—*Antiquarius.*

Pruning Forest-trees.—*Quercus*, in p. 37, wishes my opinion on pruning forest-trees, &c. At present I am inclined to think that climate and altitude have more effect upon the quality of Scotch and Larch Firs than the soil. As respects the effects pruning has upon timber I shall not say much at present. *Quercus* observes that you have said that you had never seen my writings; whereas your words were that "you had not seen them until lately," &c. I am sorry *Quercus* has never seen them; for if he had, he would have found that I have demonstrated in my table of experiments, by measuring the growth in girth of trees for several years, the utility of pruning when performed according to my instructions; and, so far from abandoning my system, I am more wedded to it by every year's experience. The various communications published on the subject show that almost all the writers, as well as *Quercus*, misunderstand my practice, and confuse it with mutilating, lopping, and snagging. But I am convinced that if I had *Quercus* or any other person half an hour with me among the "children of the forest" of a proper age and size, I could convince him of the correctness of the system, and its superior advantages as respects the quality, form, and quick or slow growth of the trees; so that *Quercus* would have no reason to hope that the system was falling into desuetude, nor wish me to use my influence to put an end to such an injurious practice, as he terms it. I can assure *Quercus* that I am not angry with him, nor any one who differs from me, but only sorry that I should not only be misunderstood, but misrepresented, and my principles and practice confounded with others less efficient and detrimental. I am certain, did we thoroughly understand each other, we should be of the same opinion, because it is the true system—my plan of pruning being simply to aid nature in the performance of her work. As I have before observed, many years' experience, with the misconceived opinions sent forth, convinces me it will be a long time before my system is understood and practised as it ought to be, unless there is an experimental plantation provided, where it can be shown by examples, and the principles explained by a competent person. Mr. Loudon acknowledges himself that he knew it by theory well, and approved of it, but was never thoroughly convinced of its superiority till he saw it exemplified by practice. I hope you will use your influence to establish an experimental plantation for the purpose near the Metropolis, where those persons interested could go and be convinced, and put the system in practice. Without something of this kind is done, the science of Arboriculture will continue to languish and be kept in the low state in which it is at present.—*W. Billington.*

Gardeners' Advertisements.—Two advertisements in a late *Chronicle* have particularly attracted my attention, as they serve to show that some gardeners unfortunately are not possessed of those attributes the respectability of our general standing demands. I allude to those of W. S., Pimlico, and A. B., Peckham, who, without the least ceremony, publish to the whole world their readiness and anxiety to press upon some influential person, of small scruple and less honour, a bribe to get them into a situation. I must own myself amazed at the glaring display they have made of want of principle in wishing those totally unacquainted with their merits or demerits to recommend them as confidential agents; but, perhaps, I am too censorious, for they may not have given the bearings of their proposal due consideration: it may not have occurred to them, that not only do they involve their own respectability, but, to a certain extent, infringe upon that of gardeners generally, by leading employers to infer that it is a customary thing among them to palm themselves in this way upon their notice, through the medium of "nurserymen and others," who esteem themselves so little as to accede to their dishonourable proposals. As a gardener, therefore, possessing a rather extensive acquaintance with my brother gardeners, and enjoying, I am proud to say, the confidence of many of them, I feel myself called upon to state that such means as those now under notice are not resorted to by respectable men; and I have always observed that in our line a man of real merit in every way is seldom long "out of place;" his numerous qualifications being too highly appreciated by those around him to allow of his remaining very long unnoticed. Before I conclude, I must again advert to the pernicious influence of these advertisements on the minds of those above us. It will be obvious to every reflecting person, that gentlemen must imagine that there is some secret source of gain with which they are unacquainted, attached to the situation of gardener, to warrant a married man to offer any person ten guineas to get him into a situation, the tenure of which must at all times be very uncertain. I would that our services were better requited, for but too many of my brother gardeners have it in their power to assert that they work their hands and rack their brains almost unceasingly for a scanty pittance, barely sufficient to provide the necessaries of life, to say nothing of its comforts, bespeaking, but too plainly, the limited means placed at their disposal by their employers.—*N. M.* [We insert this letter because of its good tone, and the importance of the sentiments it embodies; at the same time we cannot but remark that such advertisements carry their own condemnation with them.—The strictest secrecy may be relied on! Wherefore secrecy if the proposal would bear examination?]

Sparrows.—At this season most gardeners are much annoyed by sparrows destroying their crops of Peas and Lettuces, &c. I use the following simple plan with great success: I run a piece of white worsted along the top of the rows, about two or three inches above the crop. I also find that white worsted is the best remedy for preserving the buds of Gooseberries and Currants from sparrows. If those who do not use worsted for these purposes will give it a trial, they will find it answer.—*J. G.*

Sparrows.—Of all the feathered denizens of our gardens and homesteads, none are so persecuted, none so frequently falls a victim to the gardener's hatred, as the common sparrow (Fringilla domestica); but if he were to divest himself of his deep-rooted prejudice against it, he would find upon investigation that it was his friend rather than his foe. It cannot be denied that at times this bird commits great devastation among the seed-beds, &c., but, nevertheless, if its merits were fairly estimated, and if the benefits which it confers upon the gardener were duly considered, it would be found that its bad qualities are quite cast into the shade when compared with the good services it renders him. During several months of the year, its food principally consists of caterpillars and other destructive insects; its young, indeed, subsist almost entirely upon them. Few seem to be aware of the active part the sparrow takes in the destruction of these pests of the gardener; if we reckon that a single bird consumes upwards of 200 per diem (and this is a very small average considering that the caterpillars are chiefly destroyed when very small), a family of Sparrows, two old ones with five young, would thus destroy about 1500 a day, or between 11,000 and 12,000 a week, an immense destruction! Every sparrow's nest, therefore, in the vicinity of a garden should be looked upon as a tacit evidence of this exterminating warfare, which is thus silently and constantly being carried on by these birds against the noxious larvæ, &c., which infest our fruit-trees and crops. —*Boughton Kingdon.*

Daniell's Manure.—I have been trying this in various horticultural experiments, and I find it must be buried under the surface of the earth, so that the gases arising from it may be purified before they are absorbed by the foliage, or else it is injurious. I understand that Mr. Daniell himself, as soon as the weather will permit, is about to sow his Wheat on the same piece of land and from the same seed as before. His method will be to make an open drill, six inches wide, three deep, then thinly to sow the manure; after which, a second drill for the seed is made in the first about an inch deep, which pushes the manure to each side; all with one machine. The seed is then covered slightly with some fine matter, vegetable would be prefered; finally it is dragged down even. Mr. D. will this year plant fourteen inches apart, because, he says, that last year there was so much room for weeds that even the common Groundsel grew two or three feet high, and other garden weeds were alike in proportion. I hope it is not generally supposed that Mr. D. wishes his manure to be considered preferable to farm-yard dung. What he says is, that in light thin soils it will last much longer, for where the soil is so slight and rocky beneath, as it generally is on high lands, the farm manure is soon washed away, but his is so adhesive that it cannot be removed. Besides, twenty or thirty bushels of his manure are sufficient for an acre, and can be hauled anywhere in a cart; whilst the farmer finds it extremely expensive merely to convey his own manure upon the land. Most of the farmers here are trying small portions of it.—*W. Bath.*

Gladioli in the open Air.—Your correspondent "G." p. 171, is in error when he says that Gladioli, when left in the ground, "never start early enough to flower well the next season, however they may be protected." In the garden of C. Barclay, Esq., at Bury Hill, some plants of Gladiolus Colvíllii (and, I believe, some other hybrids) are growing in the open border without any protection, and these flower finely every year. G. cardinalis is also quite hardy, if the following extract from the "Gardener's Magazine" is worthy of credit. At p. 461 of the volume for last year, Mr. A. Mackenzie, of Blair-Adam Gardens, states that "in a space of about 12 feet by 7, there are not less than 500 trusses of this magnificent flower." "It is generally considered tender; yet it grows here on an elevation of about 900 feet above the level of the sea, the subsoil naturally cold and wet, in rather a light soil, with little or no protection. For two winters I gave a covering of leaf-mould, about two inches deep; but the last two winters they got none whatever, and the result is, that they were never seen growing here in such luxuriance and splendour. About the beginning of October, when I wish to propagate them, I take from well-established plants a ball or cluster of corms, about 1 or 2 feet in circumference, from one side of the strongest plants, and plant them in beds 2 feet wide, and the plants 1 foot apart, putting a little sand beneath the bulbs: and in the course of two or three years the beds will be covered with the plants: I plant them about 2 or 3 inches deep. In 1839 I planted a bed in this manner, and with as little care as I would take in planting any herbaceous plant; yet, in both seasons, namely, 1840 and 1841, the bed has been nearly covered with strong trusses of flowers." The writer further recommends "that single bulbs be grown in pots, and protected during winter (especially from damp) until they grow into a cluster of bulbs. When they have attained a sufficient size, they may be planted out with safety, and will stand the winter."

FOREIGN CORRESPONDENCE.

Nikita, in the Crimea, Jan. 16, 1842.—The seeds of Abies Nordmanniana were gathered in Sept. 1840, by Mr. Wittmann, a German gardener, whom Government had despatched to our provinces on the S. W. of Caucasus, to collect seeds and plants, and who returned with a valuable collection in June 1841. All the fruits of this expedition have been placed in the establishment under my direction. The seeds of A. Nordmanniana and Picea orientalis, sown immediately after their arrival, quickly germinated; those destined to be sent away were instantly placed in pots between layers of fine dry sand, and will doubtless have preserved their germinating power. I have the same hopes respecting the seeds of Rhododendron caucasicum, and an Azalea, which may prove to be something more than a variety of Azalea pontica; the leaves and shoots being covered with a silky down. It is only found in the subalpine region of mountains, in the province of Aghaltsiké, where Azalea pontica ceases to appear. But the most striking plant (quite a novelty in its genus) is a yellow-blossomed Pæony, found in the locality before-mentioned. Mr. Wittmann having brought a large quantity of specimens and seeds also, which are beginning to germinate, I shall be enabled during the ensuing spring or summer to supply you with this equally rare and beautiful plant. An evergreen Hibiscus with violet flowers, probably new; a species or variety (?) of Hellebore, with flowers of deep purple; three new species of Daphne from the mountains of Aghaltsiké, and a Berberis, whose leaves exhale a powerful odour resembling rose-water, are with many more plants amongst those obtained by our zealous collector. In the Gard. Magazine for 1840 there is a great error in saying that Picea orientalis is a rather slender dwarf Spruce. It possesses this habit only when young, but at a later period it becomes a tree of the loftiest growth, forming alone (like the Picea of northern Europe) the largest forests on the western slopes of southern Caucasus; whilst Abies Nordmanniana only appears there in scattered groups, like the common Silver of Europe, in the forests of Germany. Picea orientalis furnishes excellent beams and planks for the buildings of this country, consequently it is a tree well worthy of cultivation[*]. I am ignorant who has given to our Juniperus oxycedrus the name of J. taurica; Mr. Strangways having received the seeds from me simply under the name of J. oxycedrus, as it is called in the Flora Taurico-caucasica. The seeds of Pinus maritima, var. Pithyusa (in cones), have been likewise sent by me to Mr. Strangways. I received them from the coast of Abghazie de Pitzunda—the ancient Pithyus, which name was given to it by Mr. Stevens, who at first believed it to be a distinct species. I regret very much my inability to procure you, as yet, either seeds or specimens of a beautiful Sycamore, which I transmitted to Messrs. Booth, of Hamburgh[†], under the provisional name of Acer colchicum. It is a noble tree, from 70 to 80 feet high in its native country (the mountains of Abghazie and ancient Colchis), and as yet we are comparatively ignorant whether it is a variety of Acer Lobelii, or A. lætum, from the mountains of Talichâh on the Caspian Sea. There still exists a decidedly distinct species of Acer on the eastern coast near Gagra, only a single dried specimen of which I have obtained; but which I shall certainly try to procure. Seeds of three species of Acer, gathered by Mr. Wittmann, are perhaps only varieties of Platanoides (although it is rather singular to find this northern tree again under 42 degrees of latitude), of opulifolium, and pseudo-platanus. But this last variety, if it be one, appears to me to possess sufficiently marked characters for a species. The chains of mountains which traverse the western part of the Transcaucasian country, without doubt, still contain a great quantity of new and unknown plants. Count Kisseleff, our Minister of the Imperial Domains, after visiting our establishment this summer, resolved that Government should send out every two or three years, into all the countries which surround the Black Sea, on the east and south, a collector of seeds and plants, and that everything obtained by these travellers should be brought and cultivated at Nikita. I know not if the Vaccinium arctostaphylos of Bieberstein, which Mr. Stevens considers a peculiar species, and which we here possess under the name of Arctostaphylos colchica (a name given *ad interim*), is cultivated in the English gardens. We have two varieties, with pink and white flowers; the fruit is eatable, the berries large and black, and the shrub in its native country attains the height of 12 or 15 feet.

PROCEEDINGS OF SOCIETIES.

BOTANICAL SOCIETY OF EDINBURGH.

March 10.—Professor Christison in the chair. The following gentlemen were elected as non resident Fellows: W. Borrer, Esq., Sussex; Rev. W. L. P. Garnons, B.D., Cambridge; R. Taylor, Esq., F.A.S., London; A. P. Hamilton, Esq., Poole, Dorsetshire; and W. Mort, Esq., Manchester. Numerous donations to the library and herbarium were reported from different parts of Britain and the Continent. The following papers, &c., were read:—

1. On four new species of British Jungermanniæ, by Dr. Taylor, Dunkerron. Communicated by Mr. Wm. Gourlay, jun., Glasgow. —Mr. Gourlay described the species, and illustrated them by beautifully preserved specimens. Some of these were so minute as to require microscopic aid for their examination, a circumstance which enhances the merit of their discovery by Mr. Wilson and Dr. Taylor, who have laboured with so much zeal in Cryptogamic botany. The following were the species described, viz. J. Wilsoni, discovered by W. Wilson, Esq., at Cromaglown, Killarney, in Nov. 1829, and named in compliment to him by Dr. Taylor. J. stellulifera, also discovered by Mr. Wilson, who found near Crick, in Derbyshire, in Sept. 1833. J. voluta and spicata, both discovered near Killarney, in 1841, by Dr. Taylor.—Mr. Gourlay afterwards exhibited specimens of the following plants: Leskea pulvinata (Wahl.), new to the British flora, and discovered near York, by R. Spruce. Gymnóstomum Hornschuchianum (Arnott), discovered at Cromaglown by Dr. Taylor. Jungermannia Balfouriana, a new and highly curious species, brought from New Zealand by Dr. Stanger, and named by Dr. Taylor in compliment to Professor Balfour of Glasgow, from whose herbarium the above specimens were communicated.

2. Notice of the discovery of Herniária glabra in Berwickshire, by Mr. W. Marshall; and of Linnæ'a borealis in the same county, by Dr. Johnston. Communicated by Dr. Greville.—The former of these species has generally been regarded as a native of the south of England, but there seems no reason to doubt its being indigenous in the above station. It was observed that Mr. Gorrie had found the plant abundantly in Perthshire, where he had no doubt it must have escaped from gardens, though now quite naturalised, and almost a weed in some places.—The discovery of a new station for the lowly but beautiful plant to which Linnæus gave his own name is always a matter of interest, and especially in the south of Scotland, where it occurs very rarely.

3. On four new species of Desmidium. By Mr. J. Ralfs.—Mr. Ralfs observes, that "this natural genus is not well defined either in Agardh's 'Conspectus Criticus Diatomacearum' or in any of our British works. Its best distinctive character seems to consist in the crenated appearance of its filaments, which is least evident in D. mucosum. These filaments, which are generally twisted in a regular manner, are of a pale green colour, simple, fragile, short and straight. The species are found during a great part of the year in clear, shallow pools, or in old peat bogs—the filaments being scattered in loose bundles in the water, or forming a thin gelatinous fleece at the bottom of the pool. The species ascertained by Mr. Ralfs are named by him D. cylíndricum, mucosum, Swartzii, and Borreri.

5. Illustrative Drawings of Australian Plants. By the Misses M'Leod, of Sydney.

6. Notice on the adhesion of Lepas, or Barnacle, to Fuci, &c. By Mr. Edmonston; with a specimen communicated by Mr. Archibald Gibson, accountant.—Some observations were made by Mr. Edmonston and others with regard to this parasite, which at one time was popularly regarded as the veritable origin of the Barnacle goose.

7. Mr. Edmonston read a letter from Mr. P. J. Brown, of Thun, respecting the three species of Primrose usually considered to exist in this country. He says—"Against Sir J. Smith's opinion (in Rees's Cyclop.), that P. elátior may be a mule between veris and vulgaris, I may observe that the three are not often the inhabitants of the same district—veris is almost universally diffused; but where vulgaris is very abundant, I have rarely seen elátior in any quantity, and by far the most frequently not at all; while in general, as is the case at Thun, elátior grows by thousands in places within many leagues of which vulgaris is absolutely unknown. Vulgaris contents itself with an elevation but little above the level of the sea, although in the neighbourhood of the Lake of Geneva it is in perfect condition at from 1200 to 1500 feet; but at Thun, with an elevation of 1900 feet, it languishes, whether planted in a thicket, on a bank, or in a garden; while elátior, being more aspiring, prefers an elevation of from 1500 to 2000 feet, and although ascending willingly beyond the latter, descends reluctantly below the former level.

Professor Balfour (of Glasgow) made observations on the distinctions subsisting among the genera of Ferns, Anémia, Motíria, Coptophyllum, Trochópteris, and Schizéa, some of which had been recently established by Mr. Gardner. These distinctions, which are founded partly on the mode in which the fertile and barren fronds are developed, were illustrated with a series of specimens belonging to the above genera, most of which had been collected by Mr. Gardner in the province of Goyaz, Brazil. The professor next alluded to the various theories which have been advanced to account for the origin of woody fibre, and more especially to that of Du Petit Thouars. He showed, by sections of Palms, that the interlacing of the fibres in Endogenous plants was quite in conformity with Petit Thouars's theory, and that the appearance of the woody matter in Tree Ferns, and in the natural orders Piperáceæ, Aristolochiáceæ, and the formation of roots externally in some Tree Ferns, in Screw Pines, Vellozias, &c., all supported the theory of wood being formed by the development of fibres from buds acting as fixed embryos. Dr. Balfour also endeavoured to show that the formation of what have been called by Dutrochet embryo buds, may in many cases be accounted for by the development of leaves on them at one period of their growth; and that on examining some others which he exhibited, the woody matter might be traced communicating with the alburnun, at one point by rupture of the bark, and insinuating itself between the layers of bark.

---

[*] The same writer who published this notice in the Gard. Mag. has, moreover, by an inconceivable error, identified our old Asiatic species with the Abies alba of North America.

[†] Some young trees which I received from Abghazie in 1838.

The annual supper of the society afterwards took place in the Café Royal—Professor Christison in the chair.

AGRICULTURAL SOCIETY.

Mar. 16.—There was a meeting of the Council for the purpose of receiving the Report of the House Committee. The Duke of Richmond in the chair. The chairman having read to the meeting the requisition authorising the special council to meet on that day, proceeded to detail the progress of the inquiries of the committee in selecting a suitable house for the future transaction of the business of the society. The committee having decided at their first meeting that it would be unwise, in the present state of their funds, to speculate in the erection of any building adapted to the objects of the society, by the hazardous outlay of the whole of their funded property, and the probable necessity that would arise, beyond this expenditure, of a loan to meet the whole of the expenses, determined to recommend the safer course of renting a suitable house in some convenient locality. Having made inquiries in every direction for such a residence, they had been fortunate in meeting with a house in every point of view adapted for their purposes, and which they now recommended to the notice of the council. The house selected by the committee was the property of Sir G. Talbot, situated on the north side of Hanover-square, and immediately adjoining to the mansion of the Earl of Harewood. The annual rent on the house was 300*l.*, and on the fixtures 30*l.*; the freeholder being willing to grant a lease for the term of 99 years. The chairman then read the report of the committee, which on the motion of D. Barclay, Esq., M.P., seconded by W. R. C. Stansfield, Esq., M.P., was adopted and confirmed by the council.

The council then decided that the house committee should meet to take legal measures for preparing the lease of the house, and to make every arrangement for the transfer of the business of the society from their present rooms to No. 12, Hanover-square, by Saturday the 2d of April; the committee being further requested to report to the council their recommendation of the steps to be taken in reference to preparation and occupation of their new residence. Mr. Dean, as one of the members of the house committee, laid before the council various plans showing the capabilities of the new residence thus selected for the society, and read to the meeting an explanatory statement of the details of his suggestions in the appropriation of the rooms to different purposes; the council returned thanks to Mr. Dean for the pains he had taken on this subject.

At an ordinary meeting of the Council held the same day, P. Pusey, Esq., M.P., in the Chair, eighteen gentlemen were elected.—Mr. Pusey, M.P., reported to the council, as chairman of the Geological Committee, the result of Professor Phillips's examination of the specimens of native phosphate of lime from Estramadura, presented to the society by Mr. Kimberley, and referred to the Geological Committee for their opinion of its value in an agricultural point of view, as a substitute as far as the phosphate of lime was concerned for bone-dust as a manure. Mr. Phillips found that this specimen contained no less than ninety per cent. of the phosphate, and he was therefore of opinion that it would be an important manuring application, provided its mechanical texture could be modified in such a manner as to assimilate it to that of the phosphate existing in bone-dust. Mr. Pusey reported that Professor Phillips's investigations on this point had led to a successful result, and that he had discovered a mode by which this valuable mineral substance could be brought into a fit state of application as a manure; but he considered that it would be important that a full examination of the action of this substance should be instituted previously to any steps being taken to import it as an article of commerce. Mr. Pusey then communicated the willingness of Dr. Daubeny to undertake a journey into Spain, at his own expense, for the purpose of inspecting the geological occurrence of this mineral in that country, provided the society would procure for him from the British authorities a safe passport through the wild districts of Spain, through which he should have to travel in pursuing the course of this inquiry.—On the motion of Mr. Miles, M.P., seconded by Mr. Dean, it was unanimously resolved, that the council accept with their thanks this offer of Dr. Daubeny, and that Mr. Pusey, their chairman, be requested to open a communication with the Earl of Aberdeen, her Majesty's principal Secretary of State for the Foreign Department, with a view to obtain from his lordship the requisite passports and letters for the protection and safeguard of Dr. Daubeny during his journey.—F. Rotch, Esq., of Maple-Grove, Oswego County, New York, presented to the society a model of a simple and effective machine for distributing gypsum evenly over the surface of land, at any given quantity per acre. This machine is the invention of Mr. Hatch, of the State of New York, and this model is made to the scale of one inch to a foot, and consists of a pair of shafts connected with an axle-tree and two wheels. From the middle of the axle-tree rises the seat for the driver, and across the middle of the shafts is the box for containing and distributing the gypsum. This long wooden box, or triangular trough, set with upright studs along its upper and inner surface, is so fixed higher or lower by screws as to form a greater or less opening for the gypsum to escape, while the toothed rod forming the bottom has a continual motion right and left as the machine moves onward, stirring up the gypsum and regulating its escape downwards on the land. This lateral motion of the rod is occasioned by a small toothed wheel attached to one of the two large wheels of the carriage, acting on a cog-wheel and double crank; and whenever the machine is drawn forward, the motion of one of its wheels is communicated by this arrangement to the bottom of the gypsum-box, which being maintained in alternate movement backwards and forwards, the gypsum is kept in a state of continual agitation within the box, and allowed to make its even escape out of it along the regulated opening to which it is previously set. Mr. Rotch states that he has employed this machine with success for the last three years, and has found it applicable, not only to gypsum, but for sowing grain and grass-seed broadcast, and for this latter purpose a second rod is substituted, set with wire teeth, one inch apart, and standing up half an inch, the crevice along the bottom of the box or trough being narrow or enlarged as before by the screws, according to the quantity per acre to be sown. Mr. Rotch adds, that by the use of this machine the heavy dirty job of sowing gypsum is avoided, and much time saved; its simplicity and cheapness giving it, in his opinion, great value; while a single horse and boy can do the work as fast as the horse can walk over the ground. The boy, by his weight on the axle, steadies the machine, and by the movement of his foot can throw it in or out of gear at pleasure. The gypsum is required to be well ground and perfectly dry, in order to its working freely. The thanks of the council were voted to Mr. Rotch for this model and communication.—Sir C. Lemon, Bart., M.P., communicated to the society the results obtained by Professor Phillips in analysing the natural soils of the wastes on the three principal geological formations in Cornwall, namely,—the killas (or slate), the granite, and the serpentine; out of which had arisen the vast quantities of fertile land brought under the plough within the last few years, either by the addition of something wanting in their composition, or the removal of something deleterious.—The analysis of each of these waste soils, resting on the rocks in question, gave two remarkable facts:—Firstly, That the component parts, and their proportions in each soil, were nearly alike, while the rocks on which they rested were so different. Secondly, That each soil had a deficiency in the predominating ingredients of the rocks; and, the presence, on the contrary, of a component part not to be found in the rock. Thus the granite soil contains no potash, while the felspar in granite contains 17 per cent. of that alkali: the serpentine soil contains no magnesia, while the rock itself contains from 30 to 40 per cent. of that earth; and the serpentine soil, on the contrary, contains 20 per cent. of alumina, while the rock itself contains none. Yet, as Sir C. Lemon observes, these are indestructible substances; and if the soil had in each case been formed by decomposition of the rock beneath, a considerable quantity of each of the substances of the rock must have been present in the soil. Sir Charles adds, that he should have been led to doubt the accuracy of the analysis of the serpentine soil, had not Dr. Daubeny analysed the same soil a year or two ago, and arrived at the same result.—E. David, Esq., chairman of the Cardiff Farmers' Club, informed the council of the continued progress of that association, the members having amounted to about 100, and the list of donations being well filled. Mr. David transmitted a copy of his lecture delivered before the club, on the subject of Artificial Manures; and the following opinion, agreed to by the members, after the delivery of the lecture, and at the close of their subsequent discussion:—"That the abstraction of any portion of the hay and straw from the farms upon which it had been grown, must impoverish the same, unless such loss is made up by artificial or other foreign manures." The club recommended the following artificial manures as those which in their experience had been found to possess fertilising properties the most favourable to vegetation, namely, bone-dust, rape-cake, nitrate of soda, Clarke's desiccated compost, guano, and liquid manure.—W. Palin, Esq., of Stapleford, near Chester, informed the council of the complete removal of the black caterpillar from his crop of Swede Turnips, in the year 1836, by starlings which being driven, by the repeated firing of a gun, from their work of devastation on the fruit of an adjoining Cherry-tree, had alighted on the Turnip-ground; and the destruction of a crop of red apple-potatoes planted that year in the same field, by numerous small flies, which attached themselves to the under side of the leaves. Mr. Palin states that nearly the whole of the common varieties of Turnips in that part of the country, and in North Wales, were destroyed by the same kind of insect, while the Swedes and the common sorts of Turnips and Potatoes escaped injury along the sea-coast of North Wales; and he attributes the ravages of these insects to the dryness of the summer of 1836.—Mr. W. Were of Botolph-lane, expressed his willingness to communicate any facts of importance connected with the butter and cheese trade which his experience might suggest. The Rev. W. Rham presented to the journal committee a paper from a recent French work on the comparative value of food for cattle, with a tabular statement of average results. Mr. W. Baker presented copies of "The Constitution and Rules of the Rutland General Friendly Institution," together with an appendix, and the ninth general report of the institution; and Mr. J. Rivers, of Sawbridgeworth, communicated his Notes on the American and Canadian Agriculture; all of which were received with thanks, and referred to the journal committee.

Hampshire Horticultural Society.—The first meeting for the season took place at the Corn Exchange, Winchester, 17th March, when there was an excellent display of forced flowers and vegetables, a few dishes of fine Pears and Apples, and a superior collection of Amaryllis, sent by the Rev. Mr. Rashleigh. There were five or six collections of each of the various descriptions of plants for which prizes were offered; the larger portion of them were much admired, and there were individual plants in each class both rare and fine, showing much good care and management by the respective gardeners. The usual distribution of grafts and seeds was made to the members. In the evening the Very Rev. the Dean of Winchester presided at the dinner at the White Hart Inn. The following is the award of the premiums offered by the society:—FLOWERS.—Best Orchideous Stove Plant (Oncidium Baueri), dead silver medal, Rev. F. Beadon; best Stove Plant, not Orchideous, (Justicia flava,) ditto, Mr. Ralfe; best Greenhouse Plant (Chorozema várium), ditto, J. Fleming, Esq.; best collection of ditto, ditto, Rev. F. Beadon; four best Ericas, gilt-rimmed bronze medal, Rev. G. C. Rashleigh; four best Camellias, ditto, C. Deane, Esq.; four second best ditto, bronze medal, J. T. Waddington, Esq.; best Cut Flowers, gild-rimmed bronze medal, Rev. F. Beadon; two best Bulbous Plants in bloom, ditto, Rev. G. C. Rashleigh; nine best Polyanthuses, in pots, bronze medal, Rev. the Warden; four best Cinerarias, ditto, Rev. F. Beadon; best Collection of Plants, bright silver medal, Colonel Wall. EXTRAS.—Collection of Plants, ditto, Rev. G. C. Rashleigh; Ditto, German silver medal, Rev. F. Beadon; Ditto, gilt-rimmed bronze medal, Mr. Ralfe; Tree Violet, bronze medal, Miss Littlehales; Tropæ'olum tricolorum, ditto, Rev. F. Beadon; Violet, ditto, Rev. the Warden. FRUITS.—Best Pine-apple, dead silver medal, J. Fleming, Esq.; best six dishes of table Apples, gilt-rimmed bronze medal, Col. Wall; best three dishes of Pears in eating, ditto, H. Holloway, Esq. VEGETABLES.—Best brace of Cucumbers, German silver medal, H. Holloway, Esq.; second best ditto, gilt-rimmed bronze medal, Rev. F. Beadon; best forced Kidney Potatoes, ditto, H. Holloway, Esq.; best Asparagus, ditto, Col. Wall; best six stalks of Rhubarb, bronze medal, W. J. Campion, Esq.; best Seakale, ditto, Rev. the Warden; best Mushrooms, ditto, H. Holloway, Esq.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CLERODENDRON SPLENDENS. Scarlet Glory-tree. (*Stove Climber.*) Verbenáceæ. Didynámia angiospérmia.—Of the many beautiful climbing-plants inhabiting the woods of Sierra Leone, and of which so few are yet in cultivation, this is one of the best. Its foliage is of a deep rich green, and the flowers of a colour not inferior to that of Euphórbia splendens. It will be a stove plant, but one of the handsomest in the country. It has flowered with Mr. Knight, at his nursery in the King's-road, where it had been sent by Mr. Whitfield, a most zealous and enterprising collector. This gentleman has given the following account of it:—"Late in the month of December 1838, my servant, John Richards, brought to me a bunch of the flowers of the Clerodendron splendens, and afterwards took me to the spot where he found it growing wild, when I took up the root of it after much labour, as the plant was growing in a very stiff gravelly soil. Upon further search I found several others growing in a stiff loam that appeared to me to be in its virgin state; at a subsequent period I proceeded to the same neighbourhood to obtain more plants, but I was not successful. Early in February, in 1839, I rambled, when practicable, along the south-west district of Sierra Leone, where I found it growing in greater plenty and of various colours, viz., crimson, brickdust-red, orange, and bicolor (crimson and white): the latter plant seemed to me to be more luxuriant where the soil had been broken by the liberated Africans for the purpose of cultivating the Manioc; the other varieties became scarce where the soil had been disturbed, but in every instance, except the first plant, I found it growing in what I consider a strong loam, impregnated (from its colour and aptitude to stain linen) with a large portion of carbonate of iron. The plant Mr. Knight has flowered, being scarlet, makes five distinct colours; it was brought by me from Sierra Leone in May 1840, but I had previously sent to the Duke of Bedford all the varieties I have named, and I had hoped that they would have flowered long before Mr. Knight's, as they had had twelve months' advantage, having been sent to his Grace in March 1839, and again in July of the same year. When the root is shaded from the sun by the underwood, this C. splendens attains the height of 10 to 12 feet; but if it is exposed to the sun, it seldom grows more than three feet." The varieties here spoken of are probably distinct species, of which several from the same part of Africa are known to botanists. Judging from the general character of the Sierra Leone climate, it may be expected that this species will require considerable bottom-heat, a hot moist atmosphere while growing, and at least four months' rest in a drier atmosphere after its growth is completed.—*Bot. Reg.*

ANEMONE RIVULARIS. The Rill Anemone. (*Hardy Perennial.*) Ranunculáceæ. Polyándria polygynia.—A hardy perennial, growing about 18 inches high, and requiring the same treatment as Anemone vitifólia, like which it suffers in winter more from moisture than from cold. It is easily increased by seeds, or by dividing the old plants; but the seedling will not flower before the second season. It flowers freely from June to August. It was first raised from seeds received from Dr. Falconer, of Saharunpur, but it is frequently now to be found in collections of seeds from the North of India. By some error this has acquired in the gardens the name of A. longiscapa, a species distributed by Dr. Wallich, under the number 4691, but not yet introduced into systematical works. That species is clearly distinguished by its kidney-shaped five-lobed leaves, having very shaggy footstalks, and its umbellate flowers. A. rivularis occurs in various parts of the North of India; Dr. Royle describes it as common in Neussooree and elsewhere, in the vicinity of water. It has no inconsiderable resemblance to the North American A. pennsylvanica. —*Bot. Reg.*

MISCELLANEOUS.

Vegetable Weather Prophets.—The sensitive indications afforded us by many plants first claim attention, and will be found amply to repay the time that may be bestowed upon the singular properties inherent in many. The common Chickweed (Stellaria media) possesses this property in an eminent degree. "The flowers are upright, and open from nine in the morning until noon; but if it rains, they remain closed. After rain they become pendent, but in the course of a few days they again rise." "It is also a remarkable instance of the sleep of plants, for every night the leaves approach in pairs, including within their upper surfaces the tender rudiments of the new shoots; and the uppermost pair but one at the end of the stalk is furnished with longer leafstalks than the others, so that they can close upon the terminating pair and protect the end of the branch." The Purple Sandwort (Arenaria rubra) is another example of a true prophet prior to a coming shower. The flowers, a beautiful pink, expand themselves only when the sun shines, and close again as the shades of evening draw in, or before a coming shower:—

> Among the loose and arid sands
> The humble Arenaria creeps,
> Slowly the purple star expands,
> But soon within its calyx sleeps.

Next in order may be enumerated the May (Cratægus Oxyacantha), and how rich a gem would our hedgerows lose were this shrub absent from them!—

> Gives not the Hawthorn bush a sweeter shade
> To shepherds looking on their silly sheep,
> Than doth a rich-embroider'd canopy
> To kings that fear their subjects' treachery?
> Oh yes, it doth; a thousandfold it doth.

What more certain harbinger of summer have we than this shrub, opening its elegant flowers amid all changes, and blossoming as freely in the poor man's garden as in the rich man's domain? Wet summers, it has been found, are generally attended with an unusual quantity of seed in the Cratægus, their unusual fruitfulness being a sure sign of a hard winter. The seeds of the Dog Rose prognosticate the coming severity of the winter in a like manner.—*Meteorological Journal.*

The Vaugirard Cabbage (Chou Pommé d'Hiver.)—This Cabbage is not remarkable for the size or beauty of its heart, but it has the advantage of coming into season when the crops of other hearted Cabbages are exhausted, and thus fills up the void between the end of February and the end of April, when the Early York comes in. The seed is sown in June, and the young plants are finally set out between the 8th and 15th of August: the chief thing to be observed, is to retard them as much as possible without injuring them; and this is to be effected by watering cautiously during the autumn. The Vaugirard Cabbage begins to form its heart in December; and the longer this can be delayed, the more valuable will be the produce: with this view an incision is frequently made half-way through the stem close under the heart; this is done in March, but it is only the finest and healthiest plants that are so treated. Notwithstanding that this kind is very hardy, it is generally protected with long litter during severe frost. Its origin is not well known; its characters are not constant; but they generally consist in the thickness and whiteness of the leaf-stalks and ribs, and in the deep green colour of the leaves which cover the heart being often veined with red. The heart varies a great deal in form; sometimes it is round, and at others heart-shaped, but generally it is flattened, and this is the most esteemed. Seed is not saved from those plants which become yellow and form their hearts first, as they are less capable of enduring the winter than the dark green and late ones.—*Bon Jardinier.*

New Wine.—This has been produced from Vaccinium Myrtillus by M. de Chassenon. The liquor, made in large quantities, has furnished wine sufficiently good for general consumption. M. de Chassenon is assured that good vinegar may be procured from it, and that agreeable brandy may be supplied by distillation.

Preservation of Wood.—In the "Edinburgh Courant" has lately been given the following account of experiments upon the preservation of wood on Boucherie's plan, to which we have on several former occasions directed attention. The author of the experiments was W. H. Hyett, Esq., of Painswick, Gloucestershire. Two sets of experiments were detailed: 1st, on small trees, which were cut and placed upright, with their cut extremities immersed in different solutions; 2d, on standing trees, from about 12 to about 60 years old. In these last an auger hole was bored quite through the centre of the tree, and a narrow saw being introduced, the trunk was cut horizontally right and left, to within one inch or more of the outside, and the solutions poured into a basin of clay made round the base of each tree, the bottom being a little below the level of the saw-cut, and the basin, which was kept constantly full, being capable of holding two gallons. The experiments on the small trees were made chiefly in reference to colour, and various solutions were employed, as acids and alkalies, acetate of lead, bichromate of potash, muriate of tin, cochineal, sulphate of copper, muriate of iron, arseniate and prussiate of potash; and two of these were sometimes employed in experimenting upon the same tree, and the order in which they were applied was varied. Portions of the wood were then sawed off, split vertically, planed and varnished, and transmitted along with the essay. The trees subjected to experiment were Larch, Lime, Sycamore, Chestnut, Lilac, Scotch Fir, Beech, Oak, and Ash. The solutions were absorbed with greater or less facility by different trees; scarcely at all by the Ash. Many of the colours were deep and bright, as shown by the specimens exhibited; and the author observed that the colours were most brilliant when the experiment was performed in the open air and in clear weather. The experiments on the larger and growing trees were made in reference to—1st, Preservation from decay; 2d, Incombustibility; 3d, Hardness; 4th, Colour; 5th, Fragrance; 6th, Flexibility and elasticity; 7th, Diminished shrinkage; 8th, Strength of the timber. Sufficient time had not been given satisfactorily to ascertain the preservation from decay; but probable inferences were drawn on this subject from the amount of coagulation of the soluble contents of the wood by different re-agents. These re-agents were pyrolignite and sulphate of iron, corrosive sublimate, acetate of lead, muriate of soda and of lime, prussiate of potash. It appeared not only in reference to the prevention from decay, but in regard of the other heads of inquiry, that few substances acted equally upon resinous and other timbers. Muriate of lime served to confer the greatest degree of incombustibility. The hardness was estimated by the effect upon carpenters' tools, and was found to correspond pretty directly with the amount of specific gravity. The acetate of copper conferred the greatest hardness upon Beech, the pyrolignite of iron upon Larch; and the author suggested that the Beech so prepared may be found sufficiently hard and durable to be a substitute for Oak in forming wood pavement. Flexibility and strength were estimated by suspending weights in the middle of portions of wood, supported only at the ends. Their weight was increased every half-minute; the deflection at the end of every interval of suspension, and the breaking point, were noted. Deliquescent salts increase flexibility in Beech, and in the same degree diminished its strength. Deliquescent salts did not increase flexibility in Larch; on the contrary, the deflection and reduction of strength in this timber were greatest after preparation with sulphate and acetate of copper, and its strength greatest and flexibility least when prepared with muriate of lime, though this occasioned much moisture. Mineral acids, or salts in which they are in excess, were found to impair the strength of non-resinous timber more than vegetable acids. Beech is assumed as the type of ordinary dicotyledonous timbers, and Larch of the resinous; and the effects of different agents on the strength of these are compared, and important inferences drawn. "In the Beech every chemical agent, except the prussiate of potash and pyrolignite of iron, impairs the strength, as compared with the tree in its natural state; with the Larch it is increased by all. To the Beech the prussiate gives very considerably the greatest strength; to the Larch it is the only agent which gives none at all. In the Beech muriate of soda injures the strength most of all except two; in the Larch muriate of lime gives it the greatest strength." The author likewise stated instances in which there was a uniformity of effect by certain agents. He is of opinion that in relation to strength there is not a better application to both than pyrolignite of iron, though the prussiate of potash serves the best for Beech, and the muriate of lime for Larch. The strength of Beech prepared by the prussiate of potash is nearly double of that prepared by the sulphate of copper. The strength of Larch prepared by the muriate of lime, compared with that treated by prussiate of potash in its natural state, appeared from the author's experiments to be as 14 to 9. It is acknowledged that there may be some sources of fallacy overlooked in these experiments, and another series is suggested, and results of the greatest certainty on a subject of much importance to human industry and comfort expected: the necessity of these is the more apparent on account of the rival schemes which are before the public, some of which, under certain applications, may be really injurious. The essay contains a great deal of most valuable information, and this is particularly exhibited in a compendious form in a set of admirably constructed tables, in which the general results are placed very conspicuously before the reader. There are also some interesting physiological facts illustrated regarding the effects of certain agents on the living plants, and the excretion or exudation by the roots of poisonous agents, in such quantity as to prove injurious, or even fatal, to trees in the neighbourhood.

GARDEN MEMORANDA.

Veitch's Nursery, Exeter.—The Heaths are in fine condition, and the collection contains all the rarer kinds; among others now enlivening the greenhouse are depressa and translucens. Among the Orchidaceæ are two fine specimens of the lovely Dendróbium nóbile and the singular Cycnoches with curious swan-like flowers. Many species are grown in rustic baskets suspended from the roof, and these give quite a unique appearance to the house. One of the most interesting features in this nursery is a house appropriated to raising the seeds sent home from Brazil by Mr. Veitch's collector. The Camellias in the Rotunda are in fine order now, and the Pelargoniums give promise of blooming abundantly in a few months.

Loddiges' Nursery, Hackney.—The Camellias are now in great perfection. We noticed a superb specimen of imbricata covered with finely-formed flowers, of various tints, from scarlet-crimson to pink; papaverácea made a fine show with its large, almost scarlet flowers; and punctata, with white blossoms striped and spotted with crimson, contrasted well with the last-named. Among the Orchidaceæ there was a singular little Dendróbium called linguiforme, which had produced numerous spikes of spider-like blossoms. There was also a large specimen of D fimbriatum in full bloom, and the bright orange of its flowers cast quite a glow upon the surrounding plants. D. Cambridgeanum, with rich, shining, dark orange blossoms, well relieved by a purplish brown spot on the labellum, and the beautiful D. pulchellum, added to the gaiety of the house. One of the most singular plants now in blossom is a species of Cirrhopetalum with pink and white flowers, arranged in a semicircle on the top of the stem; and the oddly-formed Masdevállia infracta, with yellowish-white blossoms, having two elongations at the lower part arranged like the tusks of the Walrus, and another on the top, placed in the direction of the horn on the forehead of the fabled unicorn, is also worthy of note for its singularity. The bright yellow Oncídium ampliatum, and C. altíssimum, with long spikes of yellow and brown flowers, were in high perfection. One of the stoves was enlivened by a number of plants of Oncídium bifólium suspended from the roof; here there was also Mantísia saltatória, or Dancing-girls, in bloom; and the beautiful, but deadly, Cérbera fruticosa.—*March* 21.

Bank Farm, the seat of Sir John Broughton, Bart.—The great attraction here at present is two houses of Camellias in full bloom. The first contains specimens in pots of all the finest varieties in the highest possible state of health. The following are particularly striking, and well worthy of cultivation:—King, a fine variety in the way of Press's Eclipse; Triumphans, a large rose-coloured kind; Ochroleuca, white, tinged with yellow; Palmerii, rose-coloured; Eximia, very fine dark red; Donckelaerii—this plant, when seen in its perfect striped state (as it is here) is really splendid; Albertus, white striped and spotted, very fine. Besides these there are Sweetii, Lombardii, Imbricata, Hume's blush, Speciosa, and many others of great merit. Along the back wall are a number planted out in boxes, and although shaded by those on the stage they are in the most perfect health, indeed they seem to like this situation. But the most striking display is in the centre house of the range or the conservatory. This house is nearly filled with three plants, which are planted in the border, namely—Reticulata, Fimbriata, and Woodsii. The former is, we should say, the finest plant in the country, clothed with branches, leaves, and flowers, to the ground. We can scarcely imagine a more beautiful object, covered as it is with many hundred flowers, many of them at least seven inches across. The other two plants are equally large, and the beautiful fringed white flowers of Fimbriata, and the rose-coloured ones of Woodsii, form a pleasing contrast to the deep green healthy foliage of these plants. The best new Pelargoniums are grown in the other wing of the range, all of which look clean and healthy. Bank Farm is pleasantly situated on the banks of the Thames, near Kingston.—*R. F.*

Reviews.

What to Teach, and How to Teach it: so that the Child may become a wise and good Man. By Henry Mayhew. London: Smith.

Our motive for noticing this excellent work is to express our entire concurrence in the recommendation of the author that more importance should be given to Natural Science, as a branch of early education, than to the dead languages. It would be unjust to him to injure by short extracts the forcible reasons by which he supports his views, or to offer a meagre extract of his opinions, for nothing beyond which could we afford space. We must therefore content ourselves with recommending the work to such of our readers as are interested in the great subject of education as an essay full of original views well worthy of their consideration, much at variance no doubt with common opinions, but supported by arguments and reasoning of which it will be very difficult to diminish the force.

An Inquiry into the Principles which ought to regulate the Imposition of Duties on Foreign Corn. By G. Taylor, Esq., W.S. Murray.

This is a pamphlet of 56 pages, and is intended as a reply to one on the same subject by Mr. M'Culloch. As discussions of a political nature are foreign to our plan, we can only state that Mr. Taylor's pamphlet is an able exposition of the views of the Conservative party, written in the calm and temperate manner in which only such important questions should be conducted.

CALENDAR OF OPERATIONS *for the ensuing week.*

In ornamental grounds it is sometimes necessary, for the sake of immediate effect, to transplant trees and shrubs of large size, and much importance is attached to the success of the operation. This, in many cases, may be greatly facilitated by a little attention during the spring and early summer months; for failure is often caused by sudden bursts of hot weather, or by cold drying winds, when these occur before the plants have had sufficient time to replace their lost roots. Occasional waterings should, therefore, be given in dry weather; and to maintain a more uniform state of moisture and warmth about the tender newly-formed fibres, spread a thick mulching of rotten leaves or dung over the ground as far as the roots extend: this, if objectionable on account of its appearance, might be hid by a covering of moss. When the plants are very highly valued, they might be sheltered from drying winds, and even shaded in hot sunshine, by a temporary screen of mats. These precautions will be found worthy of adoption where the preservation of a removed plant is of more than usual consequence. It is almost needless to add, that large trees which have been recently planted should be firmly secured by props and stakes, that they may not be displaced, and their roots strained by violent winds.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—If any of the fruit which came up in autumn show signs of ripening, remove the plants to a drier and more airy situation, cut off the leaves, and give them no more water. This will greatly heighten the flavour of the fruit. The treatment of young plants need not vary from that detailed at page 176. For shading use some material which will admit the light, and merely break the sun's rays, as the plants will now be beginning to grow if shifted early.

Vinery.—Bitter cold winds and sudden showers, with intervening gleams of bright sunshine, make great caution necessary in giving air to plants, which, like the Vine, have tender foliage. In such weather carelessness in this matter may in a single hour destroy the fruits of a long period of labour and anxiety; the houses must therefore be closely attended. Admit air only by the back lights, and no more than is indispensable, keeping the floors of the houses constantly wet during the day: the leaves should also be moistened with a syringe earlier in the afternoon when a very high temperature has unavoidably been maintained. In variable weather blooming Vines will be benefited by a temporary shading of double nets, when less air will be needed. Grapes set best in a high temperature.

Peach-house.—As soon as the fruit in the early house is perfectly stoned, more heat may be applied with safety; the night temperature should therefore be gradually increased to 60°. The house commenced in January might also be kept at 60° by fire-heat. Admit air cautiously in rough weather, but liberally on clear, calm days. Make fires to the latest house only in cold nights.

Cherry-house.—The later houses, in which the fruit is stoning, setting, or the trees in full blossom, will require great nicety of management, if variable weather continues; strong currents of cold wind being equally as dangerous as close confinement. As fresh air must, however, be admitted, it will be advisable to break its force when violent by fastening mats before the opened sashes. If the black-fly appears, dip the infested shoots into strong soap-suds and tobacco-water; but be careful not to wet the flowers.

Fig-house.—Continue the treatment directed last week.

Kidney-beans.—On the principle that "prevention is better than cure," fumigate the house once a week in which these are grown. If thrips are once suffered to get a-head, some difficulty will be found in checking them. Syringe frequently.

Cucumbers and Melons.—Try to keep a steady heat of 70° or 75° in the frames. Should the heat decline suddenly, increase the night coverings, and take immediate measures to restore it. Sow and put out Melons in succession, to insure a regular supply of fruit. If the first plants are showing fruit, impregnate the flowers daily, and do not stop the fruit-bearing shoot till it is ascertained that the Melon is safely set, when one or two perfect leaves should be left beyond it. Do not permit the lateral shoots to crowd each other, and keep them regularly trained. It is a good plan to cover the surface of the soil in the beds with some substance which will prevent the rapid evaporation of moisture. For this purpose, tiles, moss, or sand, is generally used, of which the last is perhaps the best material.

New Zealand Spinach, an unworthy substitute for the common sort, should now be sown in heat, if required; but it is not worth growing.

Lettuces in frames must be freely exposed in fine weather; so likewise must young Cauliflowers, and all other vegetables under glass. Sow Mustard and Cress regularly.

Out-door Department.

Asparagus-roots may yet be planted; or seeds may be sown to remain for a permanent plantation, in which case one inch of covering will be amply sufficient.

Beet.—Sow the Silver-leaved, which is sometimes used instead of Spinach.

Borecole.—Sow the dwarf curled variety, for an autumn and winter supply.

Broccoli.—If the heads form faster than they are wanted, take up some plants and lay them in behind a wall, or stow them in ashes.

Carrots.—The principal supply for winter and spring may now be sown whenever the soil is in a fit state. The Scarlet Horn is preferable for parlour use, on account of its fine colour.

Endive.—Any that has been preserved through the winter should be blanched for use; it will be of less value when Lettuces become plentiful.

Jerusalem Artichokes may still be planted.

Parsneps.—Sow the main crop.

Peas.—If those last sown are come up, sow the same quantity of similar sorts, with Spinach between the rows; this plan will give a regular supply of both articles. Beans should be treated in the same way.

Potatoes.—Plant largely of sorts which will succeed the early varieties. Few, if any, are better than the Shaw for this purpose.

The Herbary should now be set in order, dividing and increasing the various kinds according as required. If the situation is warm, seeds of most annual species may be sown; but if exposed, they will succeed better a fortnight hence.

Orchard.—Finish the planting of Strawberries. The mulching of wall trees which have been removed should be attended to. Protect the advancing blossoms of Peach and Nectarine trees. When a crop of fruit is more important than a trifling outlay, the most effectual method of protection would be to fix stout canvas to a framing of boards, so that it might be drawn or undrawn as necessary in the way of curtains. This apparatus would also be available for the preservation of the fruit when ripe. Make gentle fires to flued walls when there is a likelihood of frost at night.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Take great care not to rot the young shoots of Orchidaceous plants with too much water—this is very easily done; look out the shades and get them ready for this house. Keep the atmosphere very moist, particulary in bright weather. Train carefully such plants as Manettia cordifolia, Ipomœas, &c.; where it is possible to plant them out, they always succeed best.

Greenhouse and Conservatory.—In giving air in boisterous weather, open the sashes on the leeward side, as a keen wind blowing directly upon the foliage would be injurious. A more liberal supply of water will now be necessary. Look over the houses every morning, and water those plants, and only those, that require it. The green-fly increases rapidly at this season, therefore occasional fumigations will be required. When only a few plants are infested, they might be dipped in tobacco-water.

Pits and Frames.—Pot young seedlings of all kinds as soon as they are large enough, and shade them in bright sunshine. Seeds of stove and greenhouse plants yet unsown ought to be put into the ground immediately. Annual flowers sown in frames for transplanting must not be allowed to stand too thick; the thinnings may be planted in another frame, or in pots. Put in cuttings of Chrysanthemums; likewise some of the last year's shoots of Hydrangeas, which have a terminal blossom bud; these should be potted singly in sixties, and regularly shifted as they advance in growth.

Out-door Department.

Persevere with the work mentioned last week. If the flower-borders yet remain undug, which, however; is only excusable where the situation is cold and backward, and the soil wet, such business ought to be no longer delayed, provided the ground is dry enough to work. Shelter the foliage of select Tulips from wet, which if succeeded by sharp frost, would most likely weaken the coming bloom. Hyacinths, likewise, and other choice plants, will be the better for protection if cold stormy weather should continue.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Cuttings of Aucuba japonica, Laurels, &c., will root if planted now, but the latter succeed best when planted sooner in the year. Transplant in rows the last year's seedlings of Rhododendrons, Azalea, Berberry, and the various shrubs which have been raised in pans; plants of doubtful hardihood, however, had better not be risked yet.

Forest and Coppice Woods.—Be expeditious in faggoting and clearing away branches and loose wood, especially in plantations devoted to the preservation of game.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending March 24, 1842, as observed at the Horticultural Garden, Chiswick.

March		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	18	29.739	29.609	52	35	43.5	W.

The highest temperature during the above period occurred on the 2d of April, in 1835—thermometer 73°; and the lowest on the 1st of April, 1838—thermometer 16°.

REPORT ON COVENT GARDEN MARKET,

For the week ending March 25, 1842.

DURING the past week the supplies have been good, but trade has been unusually dull.—*Fruit.* Pines are not very plentiful. A few Hothouse Grapes are offered at 25*s.* per lb. Apples are rather lower in price this week, but the best samples of Nonpareil are still worth 30*s.* per bushel. Easter Beurré and Beurré Rance Pears are not scarce. The supply of Strawberries is gradually increasing. Good Cucumbers are becoming more plentiful.—*Vegetables.* Excellent Broccoli, both White and Purple, abounds. Kidney-Beans are improved in quality, and not so scarce as they were. A few new Potatoes appeared this week, and realised 4*s.* per lb. Asparagus is abundant, and the quality, generally speaking, good. Sea-kale is plentiful. Young Radishes are tolerably abundant. Endive, Lettuce, and some other kinds of salading are rather indifferent. Celery has almost passed. Rhubarb is plentiful; we noticed handsome bundles of Dulley's Scarlet Admirable and Myatt's Victoria. Mushrooms are excellent.

PRICES SATURDAY, MARCH 26, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 6*s*
— Dessert, per bushel, 4*s* to 10*s*
Pears, dessert, per half-sieve, 5*s* to 16*s*
Strawberries, forced, per oz., 3*s* to 5*s*
Pine Apple, per lb. 6*s* to 12*s*
Cucumbers, per brace, 2*s* to 12*s*
Grapes, hothouse, per pound, 25*s*
— Spanish, per lb., 1*s* 6*d* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 4*s* to 16*s*
— Bitter, per 100, 7*s* to 18*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, Eng., per 100 lbs., 130*s* to 140*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 1*s* 6*d*
Cabbage, Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 3*s* to 5*s*
Brussels Sprouts, per hf. sve., 1*s* 6*d*
Broccoli, White, per bunch, 9*d* to 1*s* 6*d*
— Cape, 9*d* to 1*s* 6*d*
— Brown, 6*d*
— Sprouts, per sieve, 1*s* 6*d*
Turnip Tops, per bushel, 6*d* to 9*d*
Kidney Beans, forced, p. 100, 2*s* to 3*s*
Potatoes, per ton, 50*s* to 70*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 4*s*
Turnips, per dozen bunches, 2*s* to 3*s*
Carrots, per doz. bunches, 4*s* to 5*s*
— per bushel, 2*s* to 3*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 1*s* 6*d* to 2*s*
— Turnip, per bunch, 4*d* to 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb. 8*d*
Shallots, per lb., 1*s*
Chives, per pot, 6*d*
Onions, Old, per bushel, 3*s* to 4*s*
— for pick., per hf.-sieve, 3*s*
— Green, per doz. bunches, 2*s* to 3*s*
— Spanish, per dozen, 2*s* to 6*s*
Asparagus, per 100, large, 9*s* to 12*s*
— Second or Middling, 3*s* to 4*s*
— Sprue, or Small, 2*s* to 3*s*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, per half sieve, 1*s* to 2*s* 6*d*
Endive, per score, 1*s* 6*d* to 2*s* 6*d*
Celery, per bundle (12 to 15) 9*d* to 2*s*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d* to 1*s*
Watercress, p. dz. small bunch. 4*d* to 8*d*
Parsley, per half sieve, 2*s* to 3*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Mint, per bunch, 4*d* to 1*s*
Chervil, per punnet, 6*d*
Rhubarb Stalks, per bundle, 8*d*
Mushrooms, per pottle, 8*d* to 1*s* 3*d*
Truffles, per pound, 2*s* to 3*s* 6*d*

Notices to Correspondents.

THE occurrence of GOOD-FRIDAY compels us to defer the answers to many correspondents till next week.

J. P.—The influence of the external air on PINE-APPLES is not likely to be injurious unless it is too cold. They are found naturally in the neighbourhood of the sea-shore, and are therefore not likely to be affected by the small quantity of salt in a marine atmosphere. In all probability you are using manure in too concentrated a state. Night-soil, excellent as it is, can only be employed usefully in small quantity.

L. S.—There is no work on FORESTING that we can recommend. Sir Henry Stuart's is the best, but its reputation is far beyond its real merits. There is a treatise on the subject called "Useful and Ornamental Planting," published by the Society for the Diffusion of Useful Knowledge; but it is a poor affair.

Xanthias.—If the Chinese Gourd called Kassaba be not the Mediterranean MELON called Casawba, we know not what it is. If it is, you will find it adverted to in another place among these notices.

A Well-wisher, Beaumaris.—The plants best adapted for early FORCING are the Rose, Persian Lilac, Azalea, Kalmia, and Rhododendron. You may procure from any nurseryman as many of the above as will be necessary in the month of October. In potting them reduce the ball, and allow at least an inch between it and the sides of the pot, to supply sufficient nutriment to the young fibres which will be emitted. Roses and Lilacs will succeed in any good common soil; the rest will require to be potted in peat with which a small quantity of loam has been mixed. Water them well, and place them in the shade for a few days; a slight protection from the frost will be all that is requisite until you commence forcing them. A temperature of 45° will be sufficient to start them, which may be gradually raised to 55°. The Lily-of-the-Valley will likewise thrive in any good soil; and the fragrance of the Neapolitan Violet will amply repay for any additional trouble it may occasion. In a mixture of one-half vegetable mould, a quarter loam, a quarter well-rotted manure, and a small quantity of sand (well incorporated), it will thrive admirably, and merely requires to be placed in a light and airy situation, well protected from frost. The most suitable bulbs are the Hyacinth, Narcissus, Tulip, and Amaryllis, which may be potted in November; any tolerably rich and light mould will suit them, but they must not be covered above half their depth, neither must they be watered until they begin to grow. In all other respects they may be treated as above.

R. G.—We doubt whether pigs will eat wash from butts that have contained AMMONIACAL liquor. We would use the salt-cake in solution for the purpose of fixing ammonia on the plan spoken of last Saturday by Mr. Schattenmann.

Swain.—We recommend you to water your ASPARAGUS beds once a year with salt-water.

A Young Gardener.—Your mason is right, and you are wrong; only it would be better if you had three horizontal FLUES instead of two. How do you think such flues as you would have are to be cleaned? The best Raspberry of all is the Red Antwerp, for all purposes.

W. Hedges.—We see no difference between your STATICE and S. arborea. No such species as S. triangularis is known to botanists. S. tripteris is quite another plant.

W. D.—To improve your FLOWER-GARDEN, strike out everything except the star and the circle. Fantastical figures without symmetry are always ugly. Replace the Catharine-wheel by a handsome oval, the Maltese cross by a circle, and destroy the others. Let each compartment of the star be filled with some one kind of flower, and the circles and oval by an assortment of colours, such as we shall give next week. In order to maintain a succession the whole season long, successive sowings must be made month by month, in the manner described at p. 483 of last year.

J. G.—The CASSABA MELON will succeed in the soil and temperature suitable for other Melons in general cultivation. But it requires a very long and bright sun to acquire the excellence it has at Smyrna.

Col. Mason.—HELÓNIAS ASPHODELOIDES, or as it sometimes is called, H. tenax, requires to be planted in an American border, where it is partially screened from the sun, but not in a situation where it is overhung by large plants, or crowded. It should have rather a rich soil, composed of sandy peat and leaf-mould; when once established, it must not afterwards be shifted or parted, as, if it is, it will be years before it gains strength enough to flower. It seldom blossoms well if kept in a pot or planted in the common soil.

A Constant Reader.—The bulbs of GLADÍOLUS CARDINALIS become weakly if the tops are not protected in the autumn from early frosts, and kept growing as long as possible; much also depends on the situation—if a dry one, and whether they were planted out early. They may be taken up early in the autumn, before the tops are injured by frost, with a portion of the soil attached to each root, potted in small pots, filled with rich sandy soil, and afterwards be placed in a warm pit, kept close and moist for a few days, to allow the young bulbs to recover the shift. The bulbs will then receive all the substance contained in the young foliage, and may afterwards be gradually dried, and put to rest in the pots; when spring advances they may be started in the same pots, without any further trouble.

A Subscriber.—The following PLANTS are easily grown, flower freely, and are suitable for cutting for MARKET:—Sweet Peas, Stocks, double Larkspurs, Canterbury Bells, Wallflowers, Lupinus polyphyllus, Poppy Anemone, Double Rockets, Hyacinths, Pæonias, Mignonette; Scarlet, Purple, and White Verbenas; China and Moss Roses, Lavender, Persian Lilac, Ribes sanguineum, Heartsease, and Violets. The following are the quickest-growing hardy CLIMBERS:—White and Yellow Jasmine, Virginian Creeper, Glýcine, Honeysuckle, Clematis, and Ivy.

A Lady.—You may sow your BALSAM seeds at two seasons,—one for flowering early, and the other for obtaining large and fine plants; for if Balsams are sown early they will not attain a large size. The first sowing, for obtaining early-flowering plants, should be made about the beginning of April. The seeds should be put in in the ordinary way, placed in a Cucumber or Melon frame, and when the young plants are large enough, pot them into small pots; they will afterwards require shifting into larger pots once a fortnight. To grow Balsams to a large size, the seed should not be put in before May: the seeds should be sown in the usual way in a pot placed in a strong dung-frame; when young plants show their first rough leaves, they should be potted off singly into small pots filled with light rich soil, then plunge the pots up to the rims in the frame, and after the plants have recovered the shift, allow them to have plenty of air on all suitable occasions, by propping up the lights at the back. They will afterwards require shifting about one inch in ten days at first, but afterwards not so frequently; the soil should be made rather light at first by adding a portion of sandy peat, but should be made stronger and richer for every succeeding shift, by adding more loam and rotten dung and less peat, so that at the last shift the mould should be composed of two-thirds loam and one-third well-rotted dung. As the season advances and the plants increase in size, give them plenty of air, to prevent their being drawn up weakly, picking off all the first formed flower-buds; and when the plants have attained the desired size, give them no further shifting, but an occasional watering with liquid manure. By giving the plants plenty of air, and protecting them from the wind and rain, they may be kept in bloom all the autumn, particularly if attention is paid to picking off the decaying flowers and newly-formed seed-pods.

A Constant Reader.—The seeds of PENTSTEMON SPECIOSUM should be sown in autumn in a cool frame, and kept near the light, when the young plants come up in spring; pot them off into small pots and keep them in these until they are strong enough for planting out. When they flower save seed if possible, and always keep a young stock on hand to put in the places of the old ones, which in the most of cases are short-lived. ERYTHRINA CRISTA-GALLI must be kept in the greenhouse, perfectly dry, all the winter; in spring repot it, prune it in, and supply it liberally with water as it shows signs of growth. In mild situations it does well out-of-doors in summer, when planted out in a sheltered south border. If you have it in a pot and can give it a little heat during the growing season, it will flower all the better. CORRÆA HARRISI requires a greenhouse, and is as easily grown as the older kinds. Pot it in a mixture of peat, leaf-mould, and sand. It may be propagated either by cuttings, or, what is better, by grafting on the stronger kinds.

S. S.—The OLEANDER and GARDE'NIA RADICANS both strike freely from cuttings; the former requires a light rich loamy soil and plenty of water when growing; the latter should have bottom-heat in spring, and must be kept more cool after the flowering and growing season. Cut back your Oleander when it begins to make its young shoots. Plant your Orange-tree in a mixture of rich loam, rotten dung, and leaf-mould; add a little sand. Drain the pot or tub well, and take care that the roots do not get too dry. Cow-dung makes excellent manure-water for Fuchsias and Pelargoniums, but you may use either that or sheep's-dung with the best effects.

Mr. Edwards has had no injustice done him by us, and we cannot print complaints of the injustice of others. We can only print his letter as an advertisement.

A Young Gardener.—There is an Orange with double flowers, but it does not usually fruit.

F. G.—We have never heard of the powder of nitre being applied in a diluted form to the Ranunculus. The proper time for applying it would be from the time the buds begin to form till the plants show bloom. We recommend you to try it merely by way of experiment. The best bloomed beds of Ranunculus we ever saw were grown by very simple means. A greyish earth from a meadow where a river had been widened formed the basis of the compost. This was frequently turned over, and exposed to the influence of sun and air during three years, and in the third year cow-manure was added, with a portion of garden-mould. The beds were dug out and filled with this compost, which was of a cool and retentive nature; when necessary they were well watered; there was scarcely a failure in the beds, and when in flower they presented a complete mass of bloom. The "Horticultural Register" is to be obtained of the publishers.

J. Deacon.—Much obliged, but the extract is too absurd.

Quæso.—Your plant has no resemblance to Eupatorium odoratum; it appears to be E. glandulosum.

Lady C.—To reprint the Gardening alone would cost 800*l.*, so that your wishes cannot be complied with. We have sent for the pamphlet.

H. A. is referred to an article on Violets in to-day's paper.

F. E. C.—Stephenson's Conical Boilers are advertised at p. 186, col. *b*.

M. C.—Your plants are Goodia lotifolia, Malva capensis, and Metrosideros ericifolia.

A Constant Reader.—The statement that the Carib prepares a deadly ointment from the Belladonna Lily is upon the authority of Endlicher, who says, "Ex Amaryllide Belladonna L. Caribæi succum parant mortiferum." Perhaps Caribæi is a misprint for Caffri; Dierbach mentions the poisonous quality of the Belladonna Lily, but says nothing about the people who employ it.

W. W. J.'s Heath is dried perfectly. It appears to be E. herbácea.

C. D.—Seedling Hippeastra will be at least four years before they will flower. We have not seen any translation of Berlèze's work on the Camellia; nor is it worth translating in a country where the Camellia is far better cultivated than in France.

A Well-wisher.—We cannot enter into any public discussion of your question at present. Be satisfied that we are of your opinion that gardeners are more likely to be procured good by applying to respectable gentlemen's gardeners than elsewhere.

Goosetrumdrilla's note is an advertisement.

Mr. Stickney's letter has been unfortunately mislaid. Would he favour us with a copy of it?

Botanist's plants are—1, Rhodochiton volúbile; 2, Catananche cærulea; 3, Crucianella stylosa; 4, Heliánthemum cúpreum; 5, Papaver cámbricum; 6, Astrántia major; 7, Cerinthe major; 8, Hermánnia; 9, Polýgala vulgaris.

A Subscriber.—The Verjus, Bourdelâs, or Bordelais Grape is rarely cultivated in England. It produces large bunches; the berries are also large, oval, or somewhat obovate. It seldom ripens perfectly in France, nor is it required to do so, its principal use being for verjuice; for which purpose it is considered the best kind of Grape. In pruning it the shoots require to be left long. We never heard of cats eating Melons; but they will devour Cactuses.

W. C.—Brachysema is of too humble a growth to be considered a climbing plant, possessing more the habit of a trailer. Any collection of stove and greenhouse plants containing Clématis Sieboldii would be disqualified at the Horticultural Society's exhibition; it being now well known to be a hardy plant.

W. H.—Lime-water is the best substance for destroying worms without injuring lawns.

A Subscriber.—The Cherry-tree you allude to growing against a wall with a western aspect, having a healthy foliage, and producing a profusion of blossom, but no perfect fruit, the latter dropping off in a young state, must have been either affected by frost when in blossom, or the variety is not agreeing with the stock on which it has been worked. In case of frost, protection is the obvious remedy. If from the other cause, the tree will be strengthened by displacing a large proportion of blossom-buds in autumn. Ammoniacal liquor is sold under that name at every gas-work; it is also called gas-water. It is not gas-tar.

X. Y. Z.—Your Peach-trees will not sustain any material injury from their late pruning. Most gardeners prefer leaving it until the buds begin to swell, being then better able to distinguish between the leaf-buds and the blossom.

J. L. R. B.—Your plant is Véstia lycioides. Sandy soil is not at all adapted for Tulipa Clusiana; if planted in maiden loam in a light and airy situation, taking care that the foliage is not destroyed, you will no doubt succeed in flowering it. As soon as the stem has decayed naturally, the bulbs may be stored away in a dry and airy place, until required for planting in November.

A Subscriber from the Beginning.—One Fern is Asplénium Ruta murária, the other Cýstea dentata.

J. Z.—Your Apple is the Ord Apple, which was raised in your neighbourhood, near Fulham, about 65 years ago.

Mr. Chapman's letter will be noticed next week.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE chief interest of our intelligence from France is derived from the proceedings in the Chambers. The Ministry has sustained a check in the indefinite adjournment of the bill for granting retiring pensions to public functionaries, and a modification of the Cabinet is again seriously talked of. Much excitement has been occasioned by the determination of Ministers to postpone the introduction of a Bill for the Encouragement of Colonial Sugar; the Chambers of Commerce in all the great seaports have tendered their resignation in consequence of this decision, and disturbances among the classes dependent on the maritime interests appear to be anticipated. The Ministerial policy on this question is said to have been influenced by the fear that the rejection of the Bill, if proposed during the present Session, would be a moral check to which the Cabinet cannot expose itself on the eve of a general election.— In Spain, the excitement caused by the expected insurrection is rapidly subsiding, and the danger of an outbreak is no longer apprehended. The French authorities have removed several of the leading conspirators from the frontier to the interior of France; and effectual measures have been taken by the Regent to strengthen the frontier line of the Eastern Pyrenees. The Minister of Justice has issued a circular addressed to the bishops and local authorities, referring to the late allocution of the Pope, and absolutely forbidding the circulation of that document as an attempt to fetter the independence of the Spanish people. The negotiation between the Ministry and the Catalonian Deputies has terminated in the restoration of tranquillity to Barcelona; the municipality has been re-established; the disbanded battalions of the National Guard have been reorganised, and other concessions have been made which have given general satisfaction.—In Portugal the Ministerial crisis has terminated in favour of the Chartist party; the Queen, finding that the leading statesmen opposed to Costa Cabral refused to take office if he retired, has been obliged to yield to his demands in favour of the chiefs of the Oporto movement, and has granted the promotions and titles which were made a Cabinet question by the new Ministry. The returns for the elections being incomplete, the Cortes have been further prorogued to the 10th July. —From the Levant we have news of considerable interest; the whole of the Lebanon is said to be in a state of insurrection, and letters received through Vienna state that the united forces of the Druses and the Maronites have expelled the Turkish garrison, and that the new Pacha has either taken to flight or been killed. The details of this affair have not yet been received, but little doubt appears to be entertained at Constantinople in regard to the authenticity of the main facts. We learn also by the same advices that the Protestant Bishop of Jerusalem has been publicly insulted by the Jews and Christians in the exercise of his religious duties; the Mahometans remained neutral, and the Pacha of Jerusalem is said to have refused to interfere, on the ground that he could not furnish any protection to a foreign ecclesiastic who has not been officially recognised by the Porte.—We have intelligence from the United States to a recent date; the chief topic of interest to English readers is the discussion in the Senate on the case of the Creole slaver: the line of argument adopted by the Federal Government in its instructions to the Minister in London has given general satisfaction to the Chamber; and the policy of the Executive in regard to this affair has also been approved of. Some discussion has arisen with regard to the boundary question without leading to any decisive result. A petition has been presented from the State of Ohio, praying for a repeal of the Union, on the ground of the serious evils inflicted on the free states by the institution of slavery; but the motion for receiving the petition was negatived by a large majority.

At home, with the exception of the debates in Parliament, the week has been marked by an unusual deficiency of news. The debate on the Income-tax occupied the attention of the House of Commons during the early part of the week: the discussion was confined almost entirely to the opposition, and several divisions took place for the purpose of producing an adjournment. Sir R. Peel at first resisted all attempts to delay the measure beyond Easter, but at length gave way, and the House adjourned on Wednesday for the holidays. Previously to the adjournment, the House appointed two committees on the motion of the Colonial Secretary; the first to investigate the condition of our possessions on the west coast of Africa and their relations with the native tribes; and the second, to inquire into the state of our West Indian colonies, with reference to labour and production. In proposing these committees, Lord Stanley congratulated the country on the moral and social improvement in the condition of the negroes since the emancipation, throughout all the colonies, and expressed his conviction that they had amply vindicated the good opinion of their advocates.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue well. The Queen and Court left town on Tuesday for Windsor Castle, where her Majesty still remains. Previously to her departure for Windsor on Tuesday, her Majesty and Prince Albert visited the Queen Dowager at Marlborough House, and remained some time with her Majesty.—Lady Caroline Cocks and the Hon. Miss Cavendish have succeeded the Hon. Miss Devereux and the Hon. Miss Stanley as the Maids of Honour in Waiting on the Queen.

Official Appointments.—It is generally rumoured that the Earl of Jersey, Master of the Horse, will receive the Garter vacant by the demise of the Duke of Norfolk.—It is stated that Sir George Arthur is likely to be the new Governor of Bombay.—Her Majesty has been pleased to approve of Major-Gen. Sir E. K. Williams, K.C.B., being placed upon the Staff of the Army serving in the East Indies, *vice* Lieut.-Gen. Sir Robert Arbuthnot, K.C.B.

Foreign.

France.—*The Chambers.*—The Ministry experienced a check in the Chamber of Deputies on Thursday, by the indefinite adjournment of the Civil Pension List Bill. This bill, which was for granting retiring pensions to public functionaries, came under discussion on that day, and two members, Messrs. Mathieu and Pascalis, had spoken on the subject, when M. Gouin, ex-minister of commerce under the Thiers Cabinet, proceeded to contend that the Assembly had too imperfect a knowledge of the matter to be well prepared for its discussion, and moved that it be adjourned *sine die.* The reporter of the Committee, M. Felix Real, and M. Humann, Minister of Finance, opposed the motion, which was, however, carried by a majority of 157 against 139. The Committee of Deputies on the budget heard on Saturday the explanations of M. Guizot, respecting the increase of salaries to diplomatic agents, and the new Consulats proposed. The Committee agreed to the nominations of Consuls for Canton, Mazatlan (Mexico), Moscow, Belgrade, Jerusalem, Monterey (Mexico), Newcastle, Panama, Erzeroun, Mossoul (Mesopotamia), and Port Louis (Mauritius). Those for Janeiro (Ottoman Empire), and Djedda, were refused. The committee also declined to increase the salaries of the Marquis of Dalmatia, Minister at Turin, and M. Chasseloup Laubat, Minister at Frankfort. The creation of a diplomatic post at Buenos Ayres was approved of, as also an increase of salary for Monte Video. The increase asked for the Consul at Edinburgh was accorded, but refused to Dublin and Liverpool. The report of the Budget Committee, which is the closing labour of the Chamber of Deputies, is expected to be ready at the end of April or beginning of May. The committee has refused the proposition of the Minister of War to add the administration of the horses of studs to his department; the Minister of Commerce, who has hitherto had the management of this branch of the service, having declared that he would give in his resignation if it were transferred to the War Office. The question appears to be much agitated in Paris. The Minister of War attributes the necessity of purchasing horses from abroad for the cavalry to the inefficient system that has been pursued by the Ministry of Commerce. Reports of an approaching modification of the Cabinet are gaining ground in Paris, and it is stated by the Journals that M. Guizot will not meet the coming elections, the court fearing the effect of his unpopularity, and that Count Molé is likely to be called on to form a new Ministry. Private letters, however, do not attach credit to the supposition that Count Molé, who was unfortunate in two general elections, would be allowed to try a third time, and add that if M. Guizot should prove unable to maintain his position, the return of M. Thiers to power is almost inevitable.

The Sugar Question.—An announcement just made by the official organ, the "Moniteur," that "the Council of Ministers have decided that the Sugar Bill shall not be presented in the present session," has produced considerable excitement both in Paris, and in the departments; and disturbances in consequence were feared at all the great seaports. It is stated that the Ministry was inclined towards a system which shall suppress the beet-root manufacture in France, by allowing an indemnity to the manufacturers; and that this was more particularly the wish of the Minister of Commerce, in order to give a larger extension to the colonial trade; and of M. Humann, in order to increase the revenue. The Cabinet, however, was fearful of offending the agricultural interests on the eve of a general election, and therefore decided against bringing forward any measure on the subject this year. The "Constitutionnel" states that the Cabinet came to its decision by a majority of five against four, and that it will secure votes in the next elections from the agricultural interests by holding out the hope that in the new Chamber the beet-root sugar manufacture will be preserved and protected. The "Globe," the organ of the colonial interest, and usually regarded as a Ministerial Journal, strongly attacks the Cabinet for its decision. It accuses the Minister of Commerce of a breach of faith, as he had pledged himself, it asserts, to the colonial delegates to bring in a bill this session. The seaports are represented as greatly excited at this adjournment of the question. Intelligence of the determination of the Ministry in that respect having reached Havre on Thursday morning, much agitation ensued in that city. The Chamber of Commerce immediately assembled, and resolved that, after receiving from several members of the Cabinet the most positive assurances that no further adjournment of the question should take place, it could not with propriety continue its functions. The Chamber accordingly determined on tendering its resignation; and two of its members left Havre in the afternoon for Paris, to notify that resolution to the Minister of Commerce. The "Moniteur," official organ, in giving an account of the interview on this subject between the deputation of the maritime interests of Havre, Dunkirk, Bordeaux, and Nantes, and Marshal Soult and M. Guizot, declares that those Ministers held out the hope that the Cabinet would reconsider its resolution of adjournment of the bill. A deputation of the beet-root sugar manufacturers also waited on the same Ministers, imploring them to put an end to a state of uncertainty so fatal to their interests. The "Commerce," in its account of the interview between M. Guizot and the maritime deputation, affirms that the Minister declared that the rejection of the Bill, if proposed this session, would be a moral check to the Ministry, to which it could not expose itself on the eve of the elections.—On Wednesday, the debate on this question came on in the Chamber of Deputies. The Minister of Finance read a project of law, demanding the prolongation of the existing Sugar Bill till the next session. He explained that opinions were so conflicting on this question, that no satisfactory Bill could now be passed, and it was requisite to wait till after the next beet-root crops to come to an accurate conclusion, to form a better judgment as to the state of the native branch of industry. M. Wurtemberg, member for Bordeaux, spoke warmly against the adjournment of the Bill; and after some remarks from M. Billault and from the Minister of Finance in defence of the course adopted by Government, M. Guizot rose and said that it was for the general interests of the country that the Cabinet had come to the decision, and that the responsibility thereof ought not to be visited on a single member, but on the entire Ministry. He reminded M. Billault that he had voted for the present Bill in 1840, which he now wished to have repealed. M. Mauguin followed M. Guizot. No vote was to take place till Saturday, (this day,) when M. Humann's Bill is to be considered in the Bureaux, and it is expected there will be a grand trial of strength.

The Capital.—The journals inform us that the King and Queen of the Belgians are expected at the Tuileries, and that the apartments they are to occupy, in the Pavillon Marsan, are preparing for their reception. Their Majesties, and the Princes of Saxe Coburg, will remain in Paris till after the accouchement of the Duchesse de Nemours. From the same authority we learn that Madame Guizot, mother of the Minister of Foreign Affairs, had on Friday night, the 18th inst., an attack of apoplexy, which leaves her family and friends without hope of her recovery. On Thursday, the 17th inst., all the companies of the corps of engineers, quartered along the line of the continuous wall and of the forts round Paris, were ordered to hold themselves in readiness to resume on Monday the works of the fortifications, which have for some time been suspended. A similar order was read to all the regiments of infantry encamped in the neighbourhood. It is rumoured among the military circles of the capital, that a further reduction of the army is contemplated, by liberating the men who may belong to the levy of 1838. A carman, named Pellion, has been sentenced, by the Paris tribunals, to eight months' imprisonment and a fine of fifty francs, for having unlawful possession of arms. At his abode a carabine, a pistol, ball cartridges, and various revolutionary publications, it is said, were found, proving that he was a member of the Secret Societies.—The president of the administration of the Savings' Banks of Paris presented his report of the operations and situations of those banks during the year 1841, on the 19th inst. According to that document, the investments amounted in the year to 40,041,548f. 30c., and the reimbursements to 26,911,458f. 78c., leaving an increase of 13,130,089f. 50c., which, added to the sums deposited in the Treasury on the 31st Dec., 1841, 70,355,337f. 78c., constituted a total of 83,485,427f. 30c. invested in the Savings' Banks of Paris. As compared with 1840, the investments showed an increase in 1841 of 5,245,000f., and the reimbursements a diminution of 6,883,000f.

The Provinces.—A Calais journal announces that at the urgent entreaties of the Mayor and Deputy for the department, the Minister of War had granted an increase of the garrison of 140 infantry and 120 cavalry, but whether to resist foreign invasion or domestic troubles is not explained. The provincial papers state that the tempest of the 9th and 10th inst. was very severely felt at the mouth of the Somme, and seventy individuals, composing half the fishing population of Cuyen, had been lost at sea. An American vessel and an English coal-brig, as well as several French vessels, in the bay of the Somme, sunk at the same time. We lately announced that Madame Laffarge was dangerously ill; letters from Montpelier of the 16th mention that she has evinced symptoms of actual insanity. This fact having been made known by her physicians to the administration of the prison, the latter immediately addressed an application to the Minister of the Interior for her removal to a lunatic asylum.

The Press.—The responsible publisher of the Royalist print, the "Gazette d'Auvergne," has been tried and convicted of a libel upon the prefect of the department, and upon the Procureur-Général of the Riom Cour Royale, in articles on the proceedings of the Chamber of Deputies, relative to the famous letter of M. Isambert, noticed in previous Numbers, attributing to the Ministry of Justice a system of packing juries in France, to obtain convictions for Government prosecutions. The sentence of the Court was a fine of 4,000f. and six months' imprisonment, although M. Berryer, the Deputy, who was specially retained for the defence, made a powerful appeal in support of his client. In the speech for the prosecution the Procureur-General admitted that in making out the jury list for 1842, the Prefect purposely admitted all those Royalist names which were on it, and which were also subscribers to the Royalist Journal.

Railroads.—The railroad committee of the Deputies has decided that it will support the Ministerial plan, reserving to M. de Lamartine, the reporter, the liberty of making known to the Chamber the result of their investigations. This decision, it is said, arose from a declaration made by M. Teste, that the execution of the whole undertaking would be compromised if the Government lines were modified. Private letters, however, inform us that this bill has little chance of becoming a law this session. The Paris and Rouen Railroad Company is said to have offered to execute the line between Rouen and Havre. They estimate the expense at 400,000*l.* On account, however, of the great difficulties of ground, they have asked Government to give one-fourth and to lend another fourth; the works in and about Rouen alone being expected to absorb about one fourth.

The Navy.—There still exists great uncertainty respecting the partial disarming of the fleet, announced by the budget of 1843. Two vessels at Brest have been put out of commission, and this, it is said, will be the case with those at Toulon, when a part of the Levant division shall have returned. According to a return of the commercial navy, taken from official documents, and published in the Paris papers, it appears that the total number of merchant vessels afloat is 15,817; and that of this number 133 are steamers. These returns also show that there are in the commercial navy of France only 24 ships the tonnage of which exceeds 500 tons.

Algeria.—Accounts received from Algiers to the 10th inst. announce that Gen. Bugeaud had concluded a treaty of peace with all the chiefs of the Regency, to each of whom he had promised a sum of 50,000f. The same accounts add that the journey from Mostaganem to Oran may now be undertaken without escort, and that parties of twenty and thirty proceed to Mascara without the slightest interruption. Abd-el-Kader has lost all influence over his tribes, and he is said to be at present a refugee at the court of Morocco.

Spain.—Our intelligence from Madrid informs us that on the 13th inst. Ministers held a council, at which the expediency of modifying the Cabinet was discussed. The Chamber of Deputies have decided, by a majority of 91 against 14, that the members of the Legislature who accepted offices, favours, or decorations from Government, should not be disqualified for re-election. At the same sitting the Bill relative to the re-establishment of provincial deputations in the Basque Provinces was passed. The debate on the project of law for calling into active service, if required, 50,000 National Guards was then resumed. Señor Munoz Bueno opposed the Bill as prejudicial and contrary to the Constitution, as there was no war existing with the neighbouring nations. The Bill, however, was considered likely to pass. The "Madrid Gazette" of the 8th has an article on Sir R. Peel's speech in answer to the question relative to the recognition of the Spanish constitution by Russia, Austria, and Prussia. After an accurate translation of the right hon. Baronet's speech, with expressions of gratification at his declaration in favour of the independence of Spain, the article concludes with the following words:—"The policy of the Spanish Cabinet has for its basis the existing constitution; and consequently, whatever tends, under the authority of a foreign power, to give force and stability to our Government, to our institutions, and whatever proceeds legitimately from the constitution of 1837, can inflict no wound on our national independence, but will confirm and consolidate the liberal system in Spain, and add splendour to the constitutional throne of our Queen Donna Isabel II. It is our confident opinion that the Powers of the North of Europe will recognise the Queen of Spain and her Government much sooner than many persons believe." The "Gazette" also contains a circular addressed by the Minister of Justice to all the bishops and regents of the audiences, in which he apprises them of the publication on the 22d Feb. last of a new encyclical letter of the Pope, recommending the faithful to address prayers to the Almighty for the Church of Spain. This document contains the Regent's order, absolutely prohibiting the circulation of the Pope's allocution. The Papers allude to the assertions lately made by Mr. O'Connell in the House of Commons on the subject of the persecution of the Spanish clergy, which they contradict, and assert that the Archbishop of Toledo, so far from being under restraint, is not only at large in Madrid, but a constant visitor at the Regent's palace. Public attention appeared to be much occupied with the Barcelona question. Frequent and animated conferences had been lately held between the Ministry and the Catalonian deputies, who required the re-establishment of the municipality, dissolved by Gen. Van Halen in 1841, the reorganisation of the three disbanded battalions of the National Guard of Barcelona, and the repeal of the order issued for the dissolution of the Society of Operatives. The President of the Council promised to forward instructions to that effect to Barcelona; and accounts from that city of the 14th inst. inform us that these orders had been received there, and had given considerable satisfaction. Barcelona papers of the 14th inst. state that it was rumoured, and generally believed, that an army of observation of 20,000 men was to be formed on the frontiers of France, at the line of the Eastern Pyrenees. Several battalions having already left for Figueras, had given confirmation to these reports, and artillery and ammunition of every kind had been embarked for that stronghold to be landed at Rosas, and from thence to Figueras. The latter place is about four and a quarter leagues south of the Eastern Pyrenees, and 20 leagues north of Barcelona. There is a strong citadel built on a rock commanding the town, and it is the key of the Perpignan road to Spain. Accounts from the frontier of the 17th instant announce the receipt of pressing orders from the French Cabinet, urging the authorities to send immediately into the interior 57 Christino refugees in Bayonne. These accounts add that Baron de Meer, the Christino ex-Capt.-Gen. of Catalonia, and Gen. Breton, ex-Commandant of Tarragona, have received orders to quit Montauban, and that several Carlist refugees were to quit Toulouse, to be further removed from the Spanish frontiers. The journals publish a notice from the first Alcalde of Ximena de la Frontera, dated the 4th inst., announcing that 2,700 muskets and a quantity of ammunition had been seized by the British authorities, in the Bay of Gibraltar, on board a vessel belonging to the enemies of Spanish liberty. Letters from Algesiras of the 7th inst. state that a Dutch schooner, having on board 250 musket-barrels, and bound for Marseilles, had put into Gibraltar, but that the Governor, at the request of the Spanish Consul, had ordered her to weigh anchor and depart. The insurrectionary Junta existing at Gibraltar is said to have lately received remittances amounting to 15,000 dollars. Gen. Palarea, who had been a prisoner on parole since the insurrection of October last, died at Carthagena on the 10th inst.

PORTUGAL.—We have received intelligence from Lisbon to the 14th inst. The ministerial crisis had terminated by the Queen's yielding to the demands of the Minister in favour of the chiefs of the Oporto movement, who have obtained some titular promotions; Baron de Santa Maria being created Conde de St. Thome, MM. Agendo e Mello, the other member of the Junta, Baron de Oliveira, and the generals of division who took a leading part in the movement, raised from barons to viscounts. The Queen, it is well known, resisted these promotions, although the Ministry made them a Cabinet question: it appeared, however, that the leading statesmen opposed to Costa Cabral would not venture to take office, in the event of his resignation, and the Queen was therefore under the necessity of complying with the advice of the Cabinet. The Treasury Board, as formed under the charter, has been reorganised. Baron Tojal was about to submit to them a new project of loan, or, rather, a modification of the former project, which the postponement of the Cortes and the situation of Government required. The decree regulating the new elections, which are double or indirect under the Charter, had been published in the papers, and the Cortes further postponed till the 10th July, in order to give due time for the completion of the returns. The King had been urged to take the command of the army, which motives of expediency were thought likely to induce him to decline at present. Monsignor Capaccini is said to have become exacting, requiring, among other conditions, the return of all Don Miguel's bishops. A commission of four members, of which the Patriarch of Lisbon and the Duke of Palmella formed part, had been formed to consider his demands.

GERMANY.—From Vienna we learn that commercial credit is not yet restored in that city. The intelligence of the refusal on the part of France to ratify the treaty for the suppression of the slave-trade had also caused a slight decline in the funds, from which, however, they soon recovered. The journals state that, at a recent meeting of the shareholders of the Danube Steam-boat Company, the profits of last year were shown to be so considerable, and the advantages to be expected from an increased number of steamers on the middle Danube so apparent, that a subscription for additional shares to the amount of 1,000,000 florins at 5 per cent. interest was opened and accomplished on the spot. The company formed for continuing the railroad from Vienna to Bohemia, through Galicia into Moldavia, has applied for an exclusive privilege to Prince Stourdza, the Boyar of that principality, for 90 years; but apprehensions are expressed that a difficulty may arise on the part of Russia, from the jealousy which that Power may feel at seeing Moldavia thus intimately connected with Austria on two sides by this railroad and the Danube.—The Transylvanians have passed a resolution in their Diet declaring the Hungarian to be their national tongue, and petitioning the Emperor to cause it to be used in all the official communications.—The Government of Wurtemburg has resolved to construct railroads along the most frequented valleys of that country, thus uniting the Neckar and the Rhine with the Danube and the Lake of Constance; and a loan of 2,300,000 florins is announced for this purpose. This is the fifth railroad system announced to be commenced in the present year in various states of Germany, three of which centre in Berlin. From a survey given in the journals of the operation of the railways now existing, it appears that about 5,000,000 passengers were last year transported various distances at the rate of at least 15 miles per hour upon 16 lines; the number of passengers being the greatest on three of the shortest lines. The line from Vienna to Neustadt had 831,990 passengers. The distance is three posts, or about 30 miles, but the majority of the passengers went only to Baden, 15 miles.—Accounts from Berlin of the 14th inst. announce the arrival of the Count of Nassau, the former King of Holland, in that capital. It was reported that Chevalier Bunsen would be appointed Minister of Ecclesiastical Affairs of Prussia, and M. Eichhorn, Minister of the Foreign Department. It is stated that the expenses of the King's visit to England, which some of the German papers, it seems, estimated at 800,000 dollars, or even more, did not amount to quite 80,000 dollars.—Letters from Munich announce that the King of Bavaria has paid no regard to the opposition of the Pope to the appointment of the Bishop of Ratisbon, which had been declared uncanonical by the Sacred College; but, agreeably to the letter of the Concordat, has already caused the Bishop to take the oath of fealty at his own hands, and given orders for his enthronement, which will be performed with all pomp by the Archbishop of Munich. The address spoken by the King on the occasion is said to have given great satisfaction in Germany: "You have had three worthy and remarkable predecessors," said the King, "and I trust that you will especially follow the example of Sailer; he was imbued with a really apostolic spirit. My reign, which is now commencing its 17th year, shows what I have done for our church. I am the enemy of fanaticism, for it brings about the contrary of that which it strives after. My people shall be pious, but need not hang their heads. I repeat, let Sailer be your example, although he is now sought to be dragged in the mire; yet a truly Christian spirit actuated him, and urged him to good works." Bishop Sailer was the prelate who had the courage to refuse permission to preach to the fanatic Eberhard, who has left Munich to carry on his crusade against Protestants elsewhere. The papers state that Professor Gorres has suffered from another attack, which, it is feared, will affect his reason.

SWEDEN.—Private letters from Stockholm, dated the 11th inst., state that the 29th of the present month will be the 50th anniversary of the death of Gustavus III. and that on that day two boxes, deposited by that monarch in the University of Upsala, will be opened, in conformity with the express desire of Gustavus. It is supposed that they contain papers of interest relating to a certain period of his reign.

RUSSIA.—According to the last advices from St. Petersburg, dated the 5th inst., the Emperor is about to accompany the Empress to Germany. Their Majesties are to stop eight days at Fischbach, in Silesia, and proceed afterwards to Ems, whence the Emperor will repair to the Hague. Intelligence had reached St. Petersburg that the southern insurgents had taken advantage of the mildness of the winter to make inroads on the Russian territory beyond the Kuban and Caucasus. A body of those mountaineers, 8,000 strong, advanced, in the beginning of Jan., to a distance of 200 wersts from their country, surprised the town and fortress of Kifljar, in the Caucasian province, delivered it up to plunder, and brought off prisoners a number of its inhabitants. It was reported in the Russian capital that the Minister of War, Count Tschernitschew, would shortly set out for Teflis, and be replaced *ad interim* by Count Pahlen, the Russian Ambassador in France. Count Cancrin, the Minister of Finance, was to retain his *portefeuille*.

ITALY.—Private letters from Rome, dated the 4th inst., contain accounts of several fatal accidents from snowstorms in the mountains during the winter. Five young men who were seeking pasture for their cattle, near Villa Montalto, were destroyed by an avalanche; at Vicariati 57 persons perished; and in the environs of Civitella 27 persons on horseback were overwhelmed in the snow, and perished with their horses.

SWITZERLAND.—We learn from Zurich that the storm of the 10th inst. was severely felt in that part of Switzerland. The lake was agitated in a way hitherto unprecedented, and the grave-stones of the burial-ground were thrown down by the force of the wind.

GREECE.—Private letters from Athens dated Feb. 16 mention the general belief that the Government has for some time entertained a repugnance to the supposed views of England; and the two cabinets are thought to be on an irretrievably hostile footing. It appears that M. Mavrocordato had at length left for Constantinople, and it was supposed that the indisposition of Princess Mavrocordato had been one of the causes of his detention. During the recent visit of the British Ambassador, Sir Stratford Canning, to Athens, he had several audiences of the King; and it is said, that without at all reflecting on his royal prerogative, the ambassador exposed to him the great injustice of his conduct on several occasions, and more especially his treatment of an old and faithful servant, the most distinguished character produced by the Greek revolution. The result was the promised nomination of M. Mavrocordato to the mission at Constantinople—a step which, if not frustrated by some deplorable relapse, is regarded as likely to terminate the questions at present pending between Greece and Turkey.

TURKEY.—We have received intelligence from Constantinople, by way of Vienna, to the 23d Feb. It is of considerable interest. It states that the whole of Lebanon was in insurrection, that the united forces of the Druses and Maronites had driven from Deir-el-Kamar the Turkish garrison composed of 1,200 men, that Omer Pacha had either taken to flight or been killed, and that English, French, and Egyptian emissaries were traversing Syria, and exciting the people to revolt against the Porte. The correspondent of the German journal from whom this information is derived adds the following postscript: "Several of the embassies contradict the news from Syria; but the Ambassador of England offers no opinion on the subject. It appears certain, however, that the English Bishop of Jerusalem was pelted with stones by the Christians whilst he was preaching a sermon. The Mussulmans remained neutral on the occasion. The Druses have plundered a Maronite village near St. Jean d'Acre." These appear to be the only facts on which any reliance can be placed, though a variety of rumours of a sinister character were current at Constantinople. The inquiry made by the Ambassadors of the five great Powers relative to the Turkish Governments in Lebanon had, it is stated, created considerable uneasiness on the part of the Porte, which had not yet returned any answer on the subject. For some time past, it is said, increased activity has been observed in the Naval Arsenal, directions having been given for several large ships to be got ready, in addition to 12 which have for several months past been fit for sea. A considerable number of irregular cavalry is also said to be collecting in Anatolia. These troops are destined to go to Roumelia, under the command of Said Pacha, brother-in-law to the Sultan. The Porte is likewise preparing to send a considerable number of troops to Syria. An English courier had arrived in Constantinople from Persia, bringing intelligence from that country to the 26th ult. It appears that numerous marauding hordes of Kurds have penetrated into Tauris, where they are burning and plundering villages, and murdering those inhabitants who do not take to flight. The disorder and misery prevailing in those districts are described as extreme. Subsequent accounts mention the arrival of M. Mavrocordato at Constantinople.

UNITED STATES.—We have had four arrivals at Liverpool this week from America; the packet-ships Garrick, Oxford, and Philadelphia, and the mail steamer Acadia. In the Senate, on the 21st ult., a message was received from the President, transmitting a communication from the Secretary of State, in reply to Mr. Walker's resolution, calling for information relative to the action of Government in the case of the Creole slave-ship. The documents were read. They consisted of Mr. Webster's instructions to Mr. Everett, the United States Minister at the Court of St. James's, in regard to the case of that vessel, and the argument on which the United States Government rests for a demand for redress from the Government of Great Britain. The argument was considered able, and seemed to be perfectly satisfactory to the senators from the South. Mr. Walker expressed his gratitude at the tone and principle of the instructions. They were, he said, entirely satisfactory to him, and would be so, he believed, to the country. Mr. Calhoun had heard the documents read with great pleasure. The argument occupied the whole ground, and, coming from the source it did, it would put, he hoped, an end to this dangerous and unpleasant controversy. The documents were referred to the Committee on Foreign Relations. In the House of Representatives, on the 21st ult., Mr. Allen, of Maine, offered a resolution, which was adopted, calling on the President of the United States, if not incompatible with the public interests, to communicate to the House the state of the negotiations between the United States and Great Britain, in relation to the North-Eastern Boundary, in the state of Maine; and also all correspondences on the subject between the two Governments not heretofore communicated. The President sent, on the 26th ult., a message in answer to the resolution. He informed the House that no communication could be made by him at this time on the subject of the resolution, without detriment and danger to the public interests. The Governor of Massachusetts had sent a message to the Legislature also relative to the North-Eastern Boundary. Deeming it probable that Great Britain might shortly propose a conventional boundary, he had thought it his duty to bring the subject under their consideration, that provisions might be made for making known the sentiments of the commonwealth, in case terms of compromise should be designed with a view to a settlement. "The sentiments of Maine and the United States are unknown to me," said his Excellency, "except as disclosed to the public; but I do not view it as an impossibility that terms may be proposed which will meet the approbation of both, and it is for this event I would have the commonwealth prepared—that she may assert and vindicate her just rights, and at the same time do whatever is consistent with them to promote an amicable adjustment of the controversy." In the House of Representatives a petition was presented from Ohio, praying that the House would take immediate measures to dissolve the Union. The petition sets forth that the citizens of the free States have been suffering incalculable evils for the last 30 years, and are now suffering, from the institution of slavery. Mr. Giddings moved, that the petition be referred to a select committee, with instructions to report that the prayer of the petition ought not to be granted. Mr. Triplett moved that the petition be not received, and on that motion he moved the previous question, which was seconded. On the main question, shall the petition be received? the yeas and nays were ordered, and resulted as follows: yeas, 24; nays, 116. The petition was therefore rejected. A run had taken place on the Lafayette Bank, one of the safety fund banks of New York; but though it had met the run promptly until noon, the bank commissioners served an injunction on the bank, and its doors were closed. It was expected that its assets would be more than sufficient to meet its liabilities. Mr. S. Jaudon, held to bail by the Recorder as one of the Bank conspirators, had been released; the Judge declaring that, in his opinion, there was not sufficient cause for sending his case to the grand jury. Mr. Dunlap, another of the accused, had also been released on *habeas corpus*. The House of Representatives of Louisiana had passed, with but one dissenting voice, a resolution declaring that "the state of Louisiana holds her pledged faith as sacred and inviolable; and that they regard a repudiation of state obligations as unconstitutional and unjust, as repugnant to every principle of honour and common honesty, and as having a direct tendency to deprave private integrity, and to corrupt the morals of the people." The Locofoco committee of the House of Representatives of Mississippi had, on the contrary, made a report on the subject of the state bonds, and had appended a resolution solemnly denying any obligation of the state or the people to pay the bonds, and formally repudiating the whole debt. Lord Morpeth was at Richmond, on his way to the South. Mr. Dickens had not left New York, where he was detained by the serious indisposition of his wife.

Canada.—The accounts by the Acadia are favourable; Sir C. Bagot had arrived, and was receiving a flattering welcome from the inhabitants of both provinces. The public works were to be commenced in spring. Great rejoicings were occasioned by the news of the safety of the Caledonia steamer, no tidings of her return to Liverpool having been previously received, and 24 days having elapsed since her day of sailing. The Unicorn, formerly belonging to the Liverpool and Glasgow line, had been taken up to carry the mail; but the arrival of the Acadia rendered her voyage unnecessary.

West Indies.—The Jamaica papers received by the New York packet contain an account of the capture and destruction of the Carthagenian fleet by her Majesty's brig Charybdis, Lieutenant M. de Courcy, attached to the squadron on the West Indian station. The correct particulars of this affair do not appear to be known, but as far as they have been ascertained, it appears that a Col. Gregg and some other British subjects, either for some real or imaginary offence, were imprisoned by the Carthagenian Government. The Colonel having applied to the British Consul resident there for protection, that functionary interested himself on his behalf; but his intercession proving unsuccessful, he stated the particulars to Lieut. de Courcy, of H.M. brig Charybdis, then in the neighbourhood. Lieut. de Courcy despatched an officer with a letter to the Commodore of the squadron at anchor in Carthagena, demanding the release of Col. Gregg and the other British subjects. This letter, because it was not written in Spanish, was treated with contempt. On the officer's returning to the Charybdis, and reporting these circumstances to his commander, Lieut. de Courcy immediately entered the port, but while proceeding to an anchorage was fired into by the commodore's vessel, a corvette, by which the forestay of the Charybdis was shot away. Lieut. de Courcy then took up a position, and after a short fight the corvette surrendered, the Commodore and 25 of his men having been killed. A brig and three schooners, which came to the assistance of the corvette, were attacked in turn by the Charybdis; and in five minutes after the Charybdis brought her guns to bear on the brig, she was sunk, and the schooners soon after surrendered. The Charybdis, it seems, carries but three guns—one long one amidships, and two carronades, and her full complement of officers and men is but 55. It is added, that Lieut. de Courcy intends to remain at Carthagena with his prizes till he hears from the Admiral on the subject of their capture. From a statement given of the origin of the conflict in another account, it appears the murder of Colonel Gregg preceded the attack; and the cause of the fight is said to have been that a brig, Jane and Sarah, whilst lying at Sapote, in company with a sloop, Little William, was boarded by Gen. Carmona's squadron, both vessels plundered to a large amount of goods and specie, the crew imprisoned, and Col. Gregg and three other passengers of the Jane and Sarah shot.—A letter from Porto Rico, dated Jan. 23, states that three negroes had been shot, and eight others sentenced to the bastinado, and to be employed for ten years in hard labour on the public works of the island, for having taken part in a recent insurrection.

Australia.—Papers from Swan River, Western Australia, to the 25th Nov. have arrived. They state that the balance in hand of the land fund was 3,063*l.* 18*s.* 10*d.*, which the colonists wished should be appropriated to the encouragement of emigration. Labour appears to be required in the various districts; wages are high, but a corresponding dearness of provisions is said to exist. In the neighbourhood of the "Sound" the natives were troublesome, but the judicious conduct of the colonists had much conciliated them. Several whalers had put into the harbour, mostly American. Mr. Clark was continuing his investigation of the course of the Gordon river and its confluents, and a fine tract of pasture land had been discovered beyond Kinderup, which promised greatly for the flockmaster who had made the discovery, and who proposed immediately to remove his sheep thither. At Perth, the latest local improvements were the erection of public jetties and the establishment of a steam-boat company. The Sydney papers, received by way of New Zealand, give a very discouraging account of that colony; commercial affairs continued in a most deranged state. Several commercial houses had failed, and among them the firm of Gore and Co., for 165,000*l.* An impression prevailed that the worst was still to come. Goods had been sold by auction at the ruinous loss of 50 per cent. upon the cost price; and yet then the demand was inconsiderable, as purchasers were waiting for still greater sacrifices. To add to the melancholy prospects of the colony, the crops were burnt up for want of rain, and there was no grass for the sheep.

New Zealand.—An extract of a letter from Port Nicholson, of the 18th of November, published in the Morning Papers, states that "for every emigrant sent out and landed 80 acres of land are obtained, and 20*s.* an acre is the selling price to settlers; thus 80*l.* is the gross value of the premium, from which 20*l.*, the average cost of conveying a man from this country, is to be deducted, which leaves 60*l.* as the net proceeds of the transaction. The people can get no work; there are hundreds about the place out of employ. The company give 14*s.* a week and rations. The township of Richmond was sold the other day, a great part of which is now under water; and most people are selling their land, to get away with the first chance that offers."

Parliament.

HOUSE OF LORDS.

Saturday.—On the motion of Lord Redesdale, the Consolidated Fund Bill was read a second time, and ordered to be read a third time on Monday. The Newgate Gaol (Dublin) Bill and the West India Clergy Bill passed through Committee, and were ordered to be read a third time on Monday.

Monday.—Their Lordships sat only a short time: several petitions were presented, and several bills advanced in their respective stages.

Tuesday.—The House was to have adjourned this day for the Easter holidays; but owing to some mistake in not procuring her Majesty's signature to a commission for giving the royal assent to some bills, it became necessary that it should meet on Wednesday.

Wednesday.—Lord Brougham, after moving for returns relating to the state of business in the Court of Chancery, intimated his opinion that the appointment of one new Vice-Chancellor would have been enough. This, he said, had been predicted.

The Lord Chancellor, in reply, said that the person who predicted that had for once been a true prophet.—The returns were then ordered.

The Royal assent was given by commission to the Consolidated Fund Bill, the West India Clergy Bill, the Regulation of Apprentices Bill, the Loan Societies Bill, the Newgate Gaol (Dublin) Bill, and Mitford's Divorce Bill. The Lord Chancellor, the Archbishop of Canterbury, and Lord Wharncliffe were the commissioners.

Their Lordships then adjourned over the holidays.

HOUSE OF COMMONS.

Monday.—The Severn Navigation Bill was read a second time after some discussion, Mr. Muntz having declined to press his motion for postponement to a division.

In reply to a question from Mr. Hayter, Sir R. Peel said that the 5 per cent. additional duty of Customs and Excise, imposed in 1840 by the late Chancellor of the Exchequer, would still remain in force. It was not proposed that it should be 5 per cent. *ad valorem*, but 5 per cent. on the duty mentioned in the tariff.

To a question from Mr. Lindsay, Sir R. Peel replied by reading the Treasury minute referring the inquiry as to the real value of the opium surrendered at Canton to the Governor-General of India. Whether that inquiry was an open one or not he had not the means of answering.

In reply to an inquiry from Mr. Shaw, Lord Eliot said that it was the intention of Government to include in the estimates for the ensuing year the usual grant, without proposing any alteration in the system of national education now in force in Ireland.

On the motion for going into Committee of Ways and Means, Mr. F. Maule pressed Sir R. Peel to postpone the taking of the sense of the House on his financial resolution till after Easter, for the sake of the people of Scotland, who, from their distance, had not received intelligence of the measure in time to form and express their opinion of it.—Sir R. Peel declined to postpone the matter.—Some conversation then arose respecting the claim to priority between this financial measure and the Corn Bill, Mr. C. Wood and Mr. C. Buller preferring to proceed with the latter.

Sir R. Peel said he preferred first taking the opinion of the House on the Income-tax, as upon that the whole financial policy of the country must be based.

Lord J. Russell thought it more desirable to proceed with the Corn Importation Bill, as everybody already knew what he would have to pay to the Income-tax. The right hon. Gentleman might however, he said, take his own course. He could only say that it was his determination to divide the House on the resolution, on the report, on the first reading, on the second reading, and on the third reading.

Sir R. Peel said he regretted that the noble Lord had determined on this course; but the regret was somewhat qualified by his announcement that every one knew what he would have to pay under the Income-tax—that is to say, that every one was now reconciled to it.—The House then resolved itself into Committee, and the adjourned debate was opened by Mr. Hawes, who declared that the noble Lord should have his most earnest support in every possible opposition he could offer to this measure. He denounced the principle of an Income-tax, especially, he said, when raised for the purpose of retaliation in petty wars upon China and Affghanistan. He preferred the principle of the budget brought forward by the late Government, and protested against the injustice of taxing terminable income as heavily as that which is derived from permanent property. There was no absolute necessity, he said, for such an impost; and there were many other sources of taxation yet open.—Mr. Alderman Thompson thought the present measure far preferable to the scheme of the late Government. He trusted, however, that Government would act in a generous and confiding spirit, and give credit to the mercantile classes for returning their incomes with fairness. He hoped also that some further consideration would be given to the question of burdening terminable annuities as heavily as Consols, which he felt to be a great injustice.—Sir W. Clay observed, that a direct tax upon income, if not a vulgar, was at least a very easy expedient, for getting through a financial difficulty. He disapproved the proposal of taxing the occupier of land upon the moiety of his rent, and meant to move an alteration in that part of the scheme. He laid it down as a principle that the revenue varies inversely as the price of subsistence; citing some returns which he regarded as proving that theory: and he inferred that the Corn laws had been mainly the source of our financial deficiencies. The resource, therefore, which he should have preferred, would have been to alter those laws, to rely on such alteration for restoring the revenue, and in the mean time to meet the temporary exigency by a fresh issue of Exchequer-bills.

Sir G. Clerk defended the measure of Government. He insisted on the advantages which the proposed levy would produce to the general commerce and industry of the nation, by rendering it practicable to make those many important remissions which were proposed in the new tariff. He knew there must be some pressure, but he hoped and believed it would be courageously met.—Lord Dalmeny praised the style and clearness of the financial statement of Sir R. Peel as being unrivalled since the days of Pitt. Had the right hon. Baronet taken into account the distress of the country, and stated that he resorted to an Income-tax as a mere temporary expedient, on the road to a more liberal policy, he would have supported him. But he considered that he had proposed it in order to sustain monopolies opposed to the common sense of the age, and he should therefore oppose it.—Mr. C. Wood inveighed against the general principle of an Income-tax, which was an impost so odious to the nation, that even the strong government of Lord Liverpool had been obliged to abandon it. He thought it objectionable, mainly for this among many other reasons, that it would tend to drive capital abroad. He denied that the other means of taxation were exhausted, and reverted to the budget of the late Ministry as one which would have raised a considerable revenue without this violent sort of resource.—Mr. Scarlett briefly supported the Government measure.—Mr. P. Scrope desired to know what deductions were to be made from gross receipts, and what allowances upon incomes not produced by permanent property. To a tax on such property he should not object; but he could not agree to assess mere income equally with it.—After some remarks from Mr. Williams, in opposition to the Government measure, Sir G. Grey animadverted on the silence of members on the ministerial benches, who, he said, shrank from the obloquy of supporting their votes by their speeches. The deficiency in the revenue ought to be made up; but was it to be made up by a tax which had been repealed in 1816 by the indignant feeling of the country, and which had been originally imposed when we were struggling for national existence? He maintained it would be an inquisitorial and obnoxious impost, and when once inflicted, even for a temporary period, there was no security that it would not be perpetuated. No necessity had been shown for the tax; and even the deficiency which was made the pretence for it, had been largely accumulated by the resistance of the measures of the late Government.—Col. Sibthorp denounced the tactics of the Opposition, and applauded the vigour of Sir R. Peel.—Some discussion took place between Lord J. Russell and the Chairman about the forms of proceeding: and then, a motion having been made that the Chairman should report progress and ask leave to sit again, the Committee divided, for the motion to report progress, 51; against it, 328; majority, 277. A conversation followed, in which several members explained their reasons for voting against or in favour of the division. Mr. V. Smith attacked the Ministers for their silence. Sir J. Graham observed, that as Lord J. Russell had given notice of several contests upon this subject in its successive stages, there was the less necessity to prolong the debate now. Sir R. Peel disclaimed all want of courtesy, but declared that as he and the Chancellor of the Exchequer had both spoken so fully, they had exhausted all they had to say in the present stage. Lord J. Russell desired to have it understood that his notices had been given without any factious views; but Mr. T. Duncombe said that faction was a very good thing on a proper occasion, and that he and his friends should go on moving adjournments for the express purpose of procrastination.—Another motion being then made for adjournment, another division took place, when the numbers were—for the adjournment, 91; against it, 241.—A third motion for adjournment being made by Mr. Duncombe, with the declared view of postponing the division till after Easter,

Sir R. Peel said, that though it was in the power of the minority to prevent the division on the main question for that night, he would not voluntarily be a party to a postponement over Easter, and should therefore move to resume the committee on Wednesday. Meanwhile, wishing to have, and relying upon, the support of the country, who would not fail to appreciate the proceedings of that night, he could not lament or deprecate the course which had been taken by the minority.—Mr. F. Maule defended his own conduct in voting for the adjournments.—Sir T. Acland observed, that if gentlemen succeeded in obtaining delay without discussion, their constituents would have to make up their minds without hearing the argument.—After a few words from Mr. C. Buller, and an explanation from Sir R. Peel, the committee was adjourned.

The Rivers (Ireland) Bill, the Public Works Bill, and the Spirit Duties' (Ireland) Bill, went through committee.—On the motion of Sir J. Graham, the Queen's Bench Prison Bill was read a third time and passed.

Tuesday.—Many petitions were presented and several bills forwarded in their respective stages. John Ashworth, who had interrupted the proceedings of the Clitheroe Election Committee, was brought to the bar, admonished by the Speaker, and discharged in consideration of his expression of regret. On the motion of Sir R. Peel, the admonition of the Speaker was ordered to be entered on the journals.

Sir C. Napier brought forward a motion for the consideration of the state of the navy, with a view to its improvement. He animadverted on the Government disposal of naval patronage under successive Ministries, dwelling particularly on the administration of Lord Minto, who had, he said, ransacked all Scotland in search of the Elliot family; and had even sent to the Cape of Good Hope, for the purpose of promoting a person of that name. The Commodore then suggested a rule which, he contended, would secure uniformity in the disposal of that patronage, and give satisfaction to the navy. He also argued for an increase of the pay and pensions of the navy, and better manning of our ships; and concluded by moving three resolutions; the first recommending the appointment of Naval Lords of the Admiralty; the second, a system of retirement and purchase; and the third, a preference of officers and petty officers of the navy for the dock-yard situations, and other civil employments of the Admiralty.

Sir J. Graham combated the opinion that the First Lord should always be a naval man. It was not wise, he said, so to limit the choice of the Crown; and as to promotion, a civilian was on the whole more likely to bestow it with advantage to the public than a naval man, who would be just as much warped by politics as the civilian, and be biassed by professional partialities into the bargain. The greatest triumphs of the navy had been during the naval administrations of civilians; and the late King, who was warmly attached to his profession, had told him on his first accession to the Admiralty, that the two brightest examples he could keep in view were those of two civilians, Lord Sandwich and Lord Spencer. Mr. Pitt's authority also was in favour of the appointment of a civilian. With respect to the manning of the fleet, he rejoiced to say that the deficiency in this respect which existed during the Syrian hostilities had now been completely remedied; but he could not concur with those who thought that our fleet in the Mediterranean, even with its peace complements, would have been defeated; on the contrary, he was satisfied that the gallant Commodore had done himself and his brother officers great injustice, for he (Sir J. Graham) was persuaded that, though their ships were badly manned, they would have sustained the honour of the British flag, and triumphantly repelled every hostile attack. He was far from disapproving the resolutions of the gallant Admiral *in toto*, though the subjects of them were not such as could conveniently be dealt with by the House of Commons; and therefore, instead of meeting the resolutions with a negative, he would move the previous question.

Capt. Berkeley argued in favour of the first resolution, requiring a Naval First Lord. If, he said, a First Lord, who was a civilian, went to visit a port, he had not the same weight with the captains as a naval officer, nor would he be inclined to make, nor was he very capable of making, a personal inspection of the ships, their state, and discipline.—Lord Ingestre was favourable to Sir C. Napier's views.—Capt. Pechell also supported the resolutions.

Sir R. Peel resisted them. The first, he said, was so framed, that it went to exclude all civilians, though the speech of the mover seemed to require a professional qualification only in the one member at the head of the board. But if the resolutions were carried, Lord Haddington, unequivocally as his merits had been acknowledged, even by the mover and his brother officers, could hardly retain his present office, after such an intimation from the House of Commons. The history of Naval First Lords did not furnish encouraging precedents in favour of the principle. The right hon. Bart. then proceeded to say that he deprecated the allusions frequently made in that House to what might be the result of naval actions with other Powers. "I do not see," he said, "any public advantage whatever from speculating upon the probable results of hypothetical actions which might have taken place between our ships and those of another great Power with which we are at peace. I have heard two or three times speculations indulged in by members of this House as to what would be the probable effect of any action that might take place between our ships and those of France. Now, I do not think it wise, when two great and gallant nations, distinguished by their pride and spirit, are at peace, that we should suffer ourselves to indulge in those useless and uncalled-for speculations as to whether our navy would defeat that of France, or would be defeated by them —the assertion of the probability of our defeat being met on the other side by the confident assurance that we would defeat them. Surely, at a time when the two nations are at peace, it is every way unwise to indulge in speculations such as these; and now, when the transactions that have taken place on the coast of Syria are at an end, speculations as to the probable results of engagements which have never taken place ought to be avoided as unnecessary and uncalled for. I have myself avoided this subject, and have the utmost confidence in the naval service of this country, and, as in the case of the gallant officer—so also in the case of the navy of this country—I have thought it unnecessary to extol the spirit by which that service has always been distinguished in the performance of any duties which the country has ever at any time demanded from it. The right honourable Baronet concluded by saying that he was not an advocate for the exclusion of naval men, but he could not consent to restrict the Crown on any future vacancy, in its choice either of a naval or of a civil Minister for the head of the Admiralty as the circumstances of the time should require.

After some remarks from Mr. C. Wood, Sir T. Troubridge said that the administration of the Admiralty should be confined exclusively to naval men. He defended the condition of the Mediterranean fleet engaged in the Syrian war, particularising the ships, and censured the assertion that it ran the risk of a defeat.

Sir H. Hardinge rose to show that no undue partiality was shown to the military as compared with the naval service: he explained the circumstances under which the late brevet had been distributed between the army and navy; and concluded by saying that such was the high admiration and respect he felt for the naval service, that if any partiality was shown, he would gladly see the preference given to the naval service: for, in the insular position of this country, the paramount importance of the navy ought to be felt by every one. And he felt confident that he was speaking the sentiments of the army when he said, that if any distinction or preference was made, it should be in favour of the officers of the navy.—Sir C. Napier having replied, his three resolutions were proposed. The first was negatived without a division; the second, on a division, by 138 to 40; and the third, on another division, by 139 to 47.

Mr. S. O'Brien then brought forward a motion relative to the death of James Flanagan, at Clonmel, King's County, Ireland, the circumstances connected with which were given in this Paper at the time. The object of his motion, he said, was the production of copies of the verdict and depositions of the coroner's inquest, and also of the official correspondence with the Irish government relative to the subject.

Lord Eliot stated that the first account of the transaction, exaggerated as it evidently was, had attracted his attention, and inquiries were instantly instituted, the result of which was, that the law officers were of opinion that the jury on the inquest had come to a proper verdict. He acceded to the motion.—After a few words from Mr. Powell and Mr. W. Stewart, Mr. Wakley said that there was nothing in the case from which it could be inferred that the Irish Government ought to have instituted any further investigation. The motion was then agreed to.

Mr. T. Duncombe moved for papers relating to the conduct of the rural police in Norfolk, in the case of a vagrant, who, he stated, had been treated by one of the police with singular cruelty. —Sir J. Graham acceded to the motion, but at the same time requested the House to recollect that the statement by which the hon. Member had introduced it was entirely *ex-parte*.

Capt. Pechell, after presenting a petition from Chichester for the preservation of its local Poor-law Act, moved for returns relating to the Gilbert Unions.—The returns, with some additions, on the motion of Sir J. Graham, were ordered.

Lord Stanley moved the appointment of two committees; one for inquiring into the state of the British possessions on the west coast of Africa, and their relations with the native tribes; the other for inquiring into the state of the West India colonies, with reference to labour and production. He congratulated himself and the country on the moral and social improvement which had taken place in the condition of the negroes since the emancipation throughout all the colonies. To this effect he quoted the despatches of Governor Sir C. Metcalfe and Governor Light as to the two largest colonies—those of Jamaica and Demerara, which he considered fair samples of the whole. The negroes had shown themselves willing to labour for the high wages they were now able to obtain, and they were already saving money and buying land for their own cultivation. They had amply vindicated the good opinion entertained of them by their advocates: but this great improvement in the condition of the negroes had been accompanied with serious distress to the planters; and the circumstances of that distress would be a fit subject for the inquiry of the first of the two committees. It was a distress arising from the diminution of production which had been occasioned by the impracticability of obtaining labour except at ruinous wages. There were only two remedies—improvements in management and cultivation, and an extensive immigration of free labour. The former remedy would be a practical question which he should like to see examined by practical men. As to the latter remedy, it had hitherto been successful when the immigrants were Africans, but not when they were Europeans, the health of these latter becoming fatally affected in the low lands of the West Indian colonies. The Hill Coolies also had suffered, but the recent accounts as to this class had been more favourable. But with respect even to the Africans, a race whose health sustained no injury from the West Indian climate, much precaution was necessary, lest a new slave-trade should grow up under the name and pretext of free immigration, and the means of effecting the object without the abuse would be fit matter for the second committee to consider.—Dr. Bowring hoped that the inquiries of the committee would be extended to the causes of the failure of the Niger expedition; and Mr. V. Smith expressed a hope that they would not.—Mr. Wakley was afraid of interfering with the prosperity of the emancipated negroes, who seemed likely to be swamped by the tide of the proposed immigration.—After some further conversation, the two motions of Lord Stanley were carried without opposition.

Wednesday.—After several petitions had been presented, and some private bills forwarded in their respective stages, Sir R. Peel stated, in reply to a question from Mr. P. M. Stewart, that he did not intend to propose any drawback to the holders of timber, on account of the reduction of duty. But in order to prevent any serious loss to those persons, he intended to postpone the operation of the new scale of duty to a later day than that on which he originally intended it to take effect, viz.—the 5th April. He would state at what period the new duties were to come into operation as soon as possible after the recess.

On the motion of Sir R. Peel, it was ordered that the House on its rising adjourn until Monday, the 4th April.

Sir R. Peel requested Lord Mahon to consent to the postponement of the Copyright Bill, and the noble Lord having conceded, the bill was committed *pro forma*, and ordered to be recommitted on the 16th April.

In reply to questions respecting the Exchequer-bills Fraud Bill, Sir R. Peel said that he did not think he could do better than propose that the bill should come on on Monday week, in the hope that he should be enabled to proceed with other business.

On the motion that the Speaker should leave the chair, Mr. Blewitt expressed his opinion that the consideration of the Income-tax was pressed on with indecent haste, and proposed two or three obstructive motions in succession, each of which was pronounced out of order by the Speaker.

The House having resolved itself into Committee of Ways and Means, Lord R. Grosvenor insisted on the injustice of taxing annuities, trades, and professions, as largely as permanent property.—Mr. C. Buller thought, first, that the Minister had pressed this subject with too much haste; secondly, that upon a question of such magnitude, he ought to have held himself open to amendment; and thirdly, that he had appealed too freely to feelings of party. The present measure, he said, was a large and bold one, but it was therefore only so much the greater evil. It would, he feared, be the ready resource of all Governments, who would always find it much more easy to add 1 per cent. to an existing tax upon income, than to excite discontent among various interests by the taxation of other subjects. The hon. Member proceeded at great length to insist on the objectionable and inquisitorial character of the tax, and thought that men might escape payment by carrying their property to the Continent, which they could not have done in the time of the old Income-tax, when war was spread over all Europe. In these days of party feeling, he also considered that it was a great objection that the most violent leaders in each district should know the exact state of their neighbours' affairs. Moreover, the effect would be to spread a persuasion among foreign states, that a country resorting to this extremity in time of peace must needs be in great alarm for her safety. He concluded by saying that such a tax was not required by any existing impossibility of imposing taxes on consumable articles; for though such of those articles as were already taxed might be able to bear no additional impost, there were consumable articles not now taxed at all which might undoubtedly have been made to produce a revenue. Some of those assessed taxes which had been repealed might have been reimposed. For all these reasons he should give the measure his decided opposition.—Dr. Bowring declared himself generally favourable to direct taxation, but announced his intention of voting against it in this instance.—Mr. S. O'Brien said, that having long been friendly to direct taxation, and considering the present exigencies of the country sufficient to justify the extraordinary measure of an Income-tax, he was prepared, though against the opinions of those with whom he generally acted, to support, in the main, the measure of Sir R. Peel.—Mr. R. Palmer supported the measure, but expressed his hope that the right hon. Baronet would be able, after a reconsideration of its details, to make some distinction between professional and real incomes.—Mr. T. D'Eyncourt opposed the resolution.—Sir J. Rae Reid supported the motion, and urged Sir R. Peel to press it to a division that night, as it was the general feeling, he said, of the commercial community that it should be settled at once.—Mr. Ward did not regard a Property-tax as proper only for a season of war; it was proper for any great exigency. Neither did he regard the argument about the disparaging opinions which foreign countries might form; they, he was persuaded, took no such views of these subjects. He would, therefore, have willingly voted for a Property-tax, even had it been 5 per cent. instead of 3. But this was a tax, not upon property alone, but upon income—upon the head, the hand, the labour of every industrious man; and this he could not support.—Mr. M. Attwood declared his intention to vote in favour of the resolution, but strongly urged the injustice of taxing indiscriminately every description of income. He objected to any project of commercial reform in the present condition of the country.

Mr. Roebuck considered both sides of the House as equally responsible for having brought the country into difficulties; but if money must be raised, he approved Sir R. Peel's straightforward way of raising it. He could not understand Mr. C. Buller, who had expressed a fear of letting the people know how much they paid; that, he thought, was a strange notion coming from a man who professed to think the people competent to govern themselves. The proceedings of this session brought out the policy of the aristocratical party into strong relief. The land paid toward this tax; but as it paid no more than it had already gained by the Corn-laws, it contributed, on the total of the account, nothing to the public burthens. Nor did the very poor: Sir R. Peel had taken care to conciliate them. The hardship was on the man in middle life who toiled for his uncertain income, and was now called on to pay as large a per-centage as the owner of a capital producing the same income yearly. He had not the common horror of the word "inquisitorial;" he saw no harm in its being known what people were really worth; and he did not wish to see people protecting themselves by false credits. But he thought there were means of approximating to an estimate of each man's income without this dreaded inquisition. The rent paid by each man for his lodging would be a tolerably fair criterion. The hon. Member, in conclusion, said he would add a few words upon the moral of the subject. The Whigs had attempted twice in the present session to raise the people on their side, and they had failed. Let them do justice to the people, and the people would do justice to them.

Sir R. Peel vindicated himself from the imputation of having imported party feelings into these debates; he had only repelled the party charges of gentlemen on the other side, who had promised to consider his plan, like philosophers in the closet, but whose opposition had rather assumed the aspect of a meeting at the Reform Club. The principle of a property-tax during peace had been admitted and recorded by Lord Althorp, Mr. Poulett Thomson, and other leading members of the Opposition. The right hon. Baronet proceeded at considerable length to reply to the various arguments that had been urged against the measure. Mr. Hawes, he said, had stated on the previous night that he would not vote 1*s.* for the war in Affghanistan, and had blamed the present Ministry for not having objected to the policy of that war when first adopted. They had objected to it; but they had not thought it right, strong as they were in Parliament at that time, to cripple the country in a course of action already undertaken. It had been said that people might evade the tax on property by going abroad. They might evade taxes on consumption in the same way; but his plan would have the advantage of reaching whatever property those absentees possessed in this country. Much had been said about the injustice done to the receivers of income not produced by actual property. There must be injustice in all taxation; it was inevitable; and to relax this part of the plan would be fatal to the whole of it, so multifarious must be the exceptions and the calculations connected with them. They would require an inquisition far more vexatious than any which had yet been proposed; and they would change the principle from that of a tax upon income to that of a tax upon capital. As to the anticipations of fraud and perjury, he had not so ill an opinion of the British people as to believe that they would commit these crimes to save a fraction of three pounds in a hundred. The right hon. Baronet concluded by taking a general view of the difficulties, political and financial, which the present ministers had found awaiting them on their accession to office, and by declaring that on the acceptance or rejection of the great measure now propounded by them the existence of their Government would depend.

Lord J. Russell said he would confine himself to the subject of the Income-tax, not dealing then with the question of the tariff. He strongly represented the hardship of the principle on which the Income-tax was to be levied; but said he did not intend to propose any modification of that principle himself, because he did not choose to take the responsibility of a change which, in removing one inequality, might create others. His own course would be to vote, not for modifying, but for wholly rejecting, a measure so unequal and so unfit for any circumstances except those of the greatest exigency. Such an exigency did not now exist. If the country must be considered as at war, the late ministers could not be blamed for that increase of expenditure which war unavoidably occasioned: if the country must be considered as at peace, there was an end of the argument for the imposition of the Income-tax. He and his friends had been charged with seeking popularity, but that wish had never warped them; there was no popularity to be obtained by their present course, for the country was not yet aware of the evils which this measure would induce. The time would come when those evils would be better understood; meanwhile he would vote as his sense of duty, not his wish of popularity, directed.

After some remarks from Mr. Wood, Mr. Cobden moved an adjournment. Mr. V. Smith and Lord Howick censured this proceeding, and Mr. T. Duncombe and Mr. Wakley supported it. After a few remarks from Mr. H. Curteis and Mr. M. Gibson, the committee divided:—For the adjournment, 87: against it, 290: majority, 203. A second motion of adjournment was then made by Mr. H. Berkeley, and defeated by a majority of 141; but upon Mr. Bernal moving that the Chairman report progress and ask leave to sit again, Sir R. Peel, after protesting against the factious course which had been adopted by the Opposition, declared that he would spare the House the trouble of again dividing.—Mr. Cowper endeavoured to justify the measures of obstruction by which the progress of business was impeded; and, after a few words from Mr. Cobden, the committee adjourned over the holidays.

CITY.

Money Market, Thursday.—The funds present no new feature, and business has been limited. Money continues to command 4 per cent. Consols for money and the account closed at $89\frac{1}{2}$ to $\frac{5}{8}$ and $89\frac{3}{4}$ to $\frac{7}{8}$. Exchequer-bills left off at 27s. to 29s. premium; and India Bonds 8s. to 10s. premium.

Metropolis and its Vicinity.

The Maundy Charities.—On Monday and Tuesday the Royal Minor Alms were distributed to upwards of 800 persons above the age of 60, who received 5*s.* each. The Royal Gate Charity of 13*s.* each was also distributed to 168 persons, many of whom are very aged, and have been reduced from a prosperous condition in life. These distributions were made, under the orders of the Archbishop of York, as Lord High Almoner to her Majesty, by Mr. Hanby the secretary. On Thursday the customary distribution of her Majesty's Royal Maundy took place at Whitehall Chapel. There were present 23 men and 23 women, being the number of the years of her Majesty's age. They were above 70 years of age, and some upwards of 80. The recipients assembled at Whitehall Chapel, and the usual procession walked to the chapel, consisting of the Yeomen of the Guards in their state costumes, one of the corps carrying a gold dish which has been used on these occasions since the reign of Queen Mary, and on this dish were deposited the alms to be distributed. There were six children in attendance who had been selected for good conduct from the National Schools of Westminster and the parish of St. George, Hanover-square. These children received as a reward 5*s.*, and the linen sashes which they wore. The Dean of Carlisle officiated as Sub-Almoner. The distributions were made between each of the anthems, and the alms distributed consisted of 1*l.* 15*s.* to each woman as an equivalent for clothing, and each man received sufficient woollen and linen cloth, shoes, and stockings, to make him an entire suit. Both men and women received 1*l.* 10*s.* each as an equivalent for provisions formerly issued in kind; and a further sum of 1*l.* and 23 silver pennies, the latter being the number of years of her Majesty's age. From an historical account of this custom which has been published, it appears that the term "Maundy-money" is derived from the maunds in which the gifts were contained. Anciently, on Maundy Thursday, the Kings and Queens of England washed and kissed the feet also of as many poor men and women as they were years old, besides bestowing their maundy on each, in imitation of Christ's washing the feet of the disciples. Queen Elizabeth performed this ceremony at Greenwich, when she was 39 years of age; on which occasion the feet of the same number of poor persons were first washed by the yeomen of the laundry with warm water and sweet herbs, afterwards by the sub-almoner, and lastly by the Queen herself, the person who washed making each time a cross on the pauper's foot, above the toes, and kissing it. The ceremony was performed by the Queen, kneeling, being attended by 39 ladies and gentlemen. Clothes, victuals, and money were then distributed among the poor. James II. is said to have been the last of our monarchs who performed this ceremony in person. It was afterwards performed by the almoner. This day was also called Shere Thursday, and, by corruption, Chare Thursday. Shere Thursday signified that it was the day whereon the clergy were wont to shere, or sheare, their heads, or get them shorn or shaven, and to clip their beards against Easter-day. In the legend of St. Brandon it is related, that he sailed with his monks to the island of Sheep, "and on Shere Thursdays, after souper, he wesshe theyre feet, and kyssed them, lyke as our Lorde dyd to his dyscyples."

Death of the Earl of Munster.—On Sunday night, several noble families were thrown into severe affliction by the intelligence that the Earl of Munster had terminated his life by his own hand. From the evidence of the domestics at the inquest, it appeared that shortly after his Lordship had retired to his room for the night, the report of a pistol was heard; that his Lordship rang the bell and ordered the servant to go immediately for a surgeon, as he had accidentally shot his hand. The footman went as directed, but soon after he had left the house a second report of a pistol was heard from his Lordship's room, and on some of the domestics proceeding thither, they found his Lordship lying on the floor, having shot himself through the head; and though then alive, he died almost immediately. Dr. Chambers and Mr. Hamilton, his Lordship's medical attendants, deposed that the Earl had lately suffered from an attack of gout, and had been much depressed in spirits in consequence; that the disastrous intelligence received by the last overland mail from India seemed also to have greatly affected his mind, and that he was particularly agitated and depressed at the fate of the women who were said to have been captured at Cabul. On seeing him on Sunday evening, the medical witnesses were of opinion that his mind was disturbed, and that there appeared decided symptoms of approaching insanity. Under this impression, they directed he should be carefully attended to, and not left alone; but they had not thought it necessary that his razors or pistols should be removed from him. The members of his Lordship's family deposed to the same effect—to his having lately been much dejected, more especially since the late news from India. The jury returned the following verdict: "That deceased died by his own hand whilst in a state of temporary mental derangement." The event has created considerable excitement among the higher circles, from the rank and distinguished character of deceased. Her Majesty and Prince Albert, the Queen Dowager, and other members of the Royal Family, as well as great numbers of the nobility, immediately sent to inquire after the health of the Countess of Munster and the other members of the family.

Metropolitan Improvements.—An evening paper, the *Sun*, states that the Duke of Bedford has already received from the Treasury upwards of one hundred thousand pounds for the purchase of property, to enable the commissioners to carry into operation the projected improvements by the extension of Oxford-street in a direct line through the rookery of St. Giles's into Holborn; and that the buildings intersecting the new streets to be formed by the continuation of Coventry-street through Leicester-square, Castle street, &c., have already been purchased to a considerable extent upon the settled valuation of the surveyors.—It is announced that a Police Court is to be erected at Hammersmith, the jurisdiction of which is to include the parishes of Fulham, Brompton, Chelsea, and Chiswick. The business of the Court, however, is to be transacted at Kensington until the new office is built. The Wandsworth Police Court will hereafter include the parishes of Wandsworth, Putney, Battersea, Tooting, Merton, Wimbledon, Barnes, Clapham, and the hamlet of Roehampton.—Workmen are at present engaged in sinking an Artesian well in Piccadilly, near St. James's Church. The machinery, which is on a large scale, attracts great numbers of persons to view the novelty of the operation of boring.—A correspondent informs us that eight ornamental water-fowl have been put into Kensington Gardens, where there are now two floating islands on the Bayswater end of the Serpentine, and it is probable that a pair of black swans will soon be added. This is a good beginning, and it is hoped that there will shortly be a large stock of birds to enliven the Gardens, and assimilate them to St. James's Park.—At the meeting of the Court of Common Council on Thursday, the subject of the embankment of the Thames, according to the paper of business, was appointed to come on, but Mr. Allan, the chairman of the navigation committee, stated to the Court that the question being one which comprehended a variety of interests, and required the most strict and unbiassed examination, he should postpone the consideration of the report until the members should be prepared for it by a perusal of the details. The matter was then fixed for the next court-day.

Public Meetings.—At the Quarterly General Meeting of the Proprietors of the East India Company, held on Wednesday, after the transaction of some other business, Mr. Weeding said he wished to learn if the Court of Directors had received any official information respecting the position or fate of the British army in Cabul, and if it was true that the forces in the citadel, as well as those in the cantonments, had left the place and been destroyed. The chairman, Mr. Lyall, M.P., replied that no official information had been received upon the subject, beyond the details given in the public papers of the disasters at Cabul, as given by Dr. Briden, on his arrival at Jellalabad. Mr. Weeding asked, if, in the opinion of the Directors, the news was true? The chairman replied in the affirmative. Mr. M. Martin then rose and said he had to bring forward a subject of great importance to the proprietors of India stock. He wished to bring before the court the position in which the Indian Government had been placed by the unfortunate war in Affghanistan, and the expenses that had been already incurred by it. He considered that the ruinous war in Affghanistan would only produce misery, and that the finances of the country, as stated by Sir R. Peel in his place in Parliament, would suffer most materially. He calculated that the deficiency in the Indian revenues for the year ending in May 1842 would not be less than ten or eleven millions sterling, whereas in 1836 there was a surplus over expenditure of 1,520,000*l.* With a deficiency in revenue such as had been stated, where were the dividends of the proprietors to come from, and in what position would the proprietors of East India stock be placed shortly? The hon. proprietor then read his notice of motion, which was as follows:—"The responsible and important duty confided to this court of exercising a watchful supervision on the expenditure of the revenues of British India, requires at all times vigilant attention, but most especially at the present period, when there is a progressingly decreasing income to meet an annually increasing expenditure, and which, if continued, will inevitably produce serious consequences, and prove highly detrimental to the condition of our East India fellow-subjects. Resolved, therefore, that there be laid before this court a statement of the yearly expenses caused by the wars in Affghanistan and Scinde, from 1838 to 1841, inclusive, as nearly as can be ascertained from the public accounts, or from estimates." Mr. Hume said, "that though he concurred in many of the remarks made by the honourable proprietor, he could not agree with those of Sir Robert Peel respecting the finances of India, and he wished that those of England were in as good a position as those of India. This was not a time to talk of the finances of India, when the feelings of nature were shocked at the losses that had occurred at Cabul. As respects the war, justice could not be done to the question without due notice was given of the discussion." Several proprietors then took part in the discussion, which terminated by the resolution of Mr. Martin being withdrawn on a point of order. Mr. Salomons then gave notice for the next court that he should bring forward a motion for returns relative to the expenses of the war in Affghanistan; also, if any, and what loans had been raised in India; and for a copy of the protest, if any, of Mr. St. George Tucker against the war. Mr. Hume asked if it was true that any disaffection had broken out among the 52d Regiment in India, in consequence of an alteration in the payment of half-batta? This was a time, of all others, when the army in India ought to be kept in good humour. The chairman, it was understood, replied that there was no truth in the statement. Another topic of interest which calls for observation was the motion of Mr. Marriott on the subject of Sutteeism. After some general remarks on the subject, he concluded by moving the following resolution:—"That the honourable directors be requested, in the case of the suttee which was lately permitted in the territory of the Nizam, and in all cases of a similar nature, to recommend to the foreign rulers the immediate abolition of that inhuman and sanguinary rite, as the same has already been effected in the dominions of the honourable company." The chairman said that the directors had instructed their officers to interfere for the purpose of putting a stop to sutteeism as far as they could do so with discretion. The practice had been entirely abolished at Sattara, Mysore, Cawnpoor, and several other residencies; and he had no doubt that a proper representation of the feelings of the British Government on the subject would have its due weight at the Court of Nizam. After some further discussion, the resolution was put and carried.

Court of Common Council.—At a meeting of the Court of Common Council, held on Thursday, the election of a Common Pleader for the City of London, which has caused for some time past considerable excitement among the electors, was finally decided. Upon the motion of Mr. Conder, the 26th standing order, requiring that candidates for the office of Common Pleader should be free of the city for two years, was suspended. Petitions were then presented from Sir Walter Riddell, Bart., barrister-at-law, from Mr. P. Laurie, barrister-at-law, and from Mr. J. Locke, barrister-at-law, each praying to be elected to the office of Common Pleader. There being three candidates for the office, the number was, according to the standing order of the Court, reduced to two by the show of hands, which was much more numerous for Mr. Laurie, and a little more numerous for Mr. Locke, than for Sir W. Riddell. The election then proceeded by poll, and ended in favour of Mr. Laurie; the numbers being—for Mr. Laurie, 112; for Mr. Locke, 75: majority in favour of Mr. Laurie, 37. The Lord Mayor then informed Mr. Laurie that the election had fallen upon him. Mr. Laurie, Mr. Locke, and Sir W. Riddell then severally addressed the Court, and returned thanks for the support which they had received. At the previous meeting the Freedom of the City was presented to the Duke of Cambridge. After a suitable address from Sir J. Shaw, the City Chamberlain, who presented the freedom to his Royal Highness in a handsome gold box, the Duke, amidst great applause addressed the Lord Mayor and the Court in a short speech. He felt, he said, the highest gratification in receiving such a testimony of the approbation of the corporation of the City of London, for whom he always entertained the greatest respect. He had, some years ago, in the capacity of General of the London district, had frequent opportunities of meeting the magistracy of the City, and he had upon various occasions enjoyed the very splendid and hearty hospitality for which the citizens of London were so celebrated, and had uniformly observed that, whatever differences of political opinion might have existed, there were always to be seen the most devoted loyalty to the sovereign, and the most warm attachment to the institutions of the country. He received the Freedom of the City with the greatest pride and satisfaction from the hands of his fellow-citizens; and he could not help expressing, at the same time, the pleasure he derived from the very kind and respectful manner in which he had been received. His Royal Highness, who was attended to the gates of the Guildhall by the Chamberlain, several Aldermen, and the mover and seconder of the vote of presentation, was loudly cheered as he passed along.—The Chamberlain was afterwards instructed to pay 500*l.* from the funds of the City in aid of the fund for the relief of the Spitalfields weavers; and it was referred to the coal, corn, and finance committee to consider whether any, and, if any, what sum should be subscribed in aid of the charity called "the City Kitchen."

The Thames Fisheries.—On Wednesday, the Thames Angling Society held its annual meeting. The chairman said that the river was now in fine order for angling; that it was full of fish of every description. If the public would come forward and support the efforts of the society, the river would be kept in its present state; but if they did not, the river, in two or three years, would be in as bad a state as it was four years ago. From the report, it appeared that the expenses of last year amounted to 191*l.* 17*s.* 3*d.*, whereas the receipts were only 137*l.* 11*s.* About 190*l.* a year would enable the society to keep the river in a good condition for angling, and it was considered surprising that in London, where there were so many anglers, subscribers could not be found in sufficient number to raise that sum. The report, after enumerating the good the society had done in preserving the river, appealed to all brothers of the gentle craft, to aid them in trying to afford in the neighbourhood of London a day's sport to every angler. A gentleman residing on the banks of the Thames, and who said he had fished the river for the last forty years, stated that he never saw so many fish of superior quality and size as there were in it now: that until the present society had been instituted, he had never killed a jack in the Thames, but last year he had killed as many as three or four in a day. The number of trout, he said, had also increased, and now, both with spinning the minnow, the bleak, or gudgeon, or with the artificial fly, large and fine fish of that species may be taken. Bank fishing and perch fishing had also been improved by the efforts of the society, as might, he stated, be seen by the success of anglers who fish from the banks in the meadows near Isleworth, Richmond, Twickenham, Teddington, &c. The report was received, and a memorial agreed to, addressed to the Lord Mayor, as Conservator of the Thames, begging his Lordship to confirm the appointment of five water bailiffs chosen by the society.

Clerkenwell.—A church-rate contest has been carried on in this parish for some days, which created a good deal of excitement, and terminated on Wednesday, the numbers at the close of the poll being as follows:—Against the payment of an accumulation of four years' expenses, incurred by the churchwardens of St. John's, 799; for the payment, 725; majority, 74.

Metropolitan Police.—According to a recent return made to the House of Commons, it appears that the moneys expended for all the purposes of the Metropolitan police, made up to the 31st Dec., 1841, amounted to 287,225*l.* 10*s.* 2*d.*; and that the number of men of each rank and class serving on the 1st Jan., 1842, amounts to 4,414.

Mortality in the Metropolis.—The following is the number of deaths in the Metropolis from all causes, registered in the week ending Saturday, the 12th inst.:—males, 471; females, 419; total, 890. Weekly average 1838-9-40-1: males, 467; females, 445; total, 912.

Provincial News.

Cambridge.—Considerable interest has been excited among the sporting characters in this city and neighbourhood by a trial which was decided at the Assizes on Wednesday. The parties were Daintree *v.* Hutchinson; and the object of the plaintiff was to enforce the penalty of 100*l.* from the defendant, on an agreement to run a match at coursing. Both the parties are sporting men, and being possessed of two celebrated greyhounds, they entered into an agreement to run the aforesaid match on the Wednesday in the Newmarket February meeting. It appeared that though the meeting was fixed for Feb. 3, at the time the match was made, yet that, according to the practice in such cases, the actual day for sport was postponed for a fortnight, in consequence of a hard frost, which precluded all idea of running the dogs. The plaintiff was ready to run on the adjourned day, but the defendant did not appear; and the question was, whether, by the terms of the agreement, the day was to be taken to be that named in the agreement, or that to which the meeting had been postponed. On a former trial, before Mr. Baron Alderson, that judge had held that the defendant's construction was a correct one, and the plaintiff was thereupon nonsuited; but on a motion for a new trial, the court above had reversed that decision, and the case now came down for a new trial. The same evidence was given as had been before adduced by the plaintiff; and a verdict passed for the plaintiff, subject to certain other objections which were raised on the part of the defendant.

Chatham.—Much activity prevails in all the arsenals of the country, in consequence of the proposed increase of the army, and the preparation of transports for the embarkation of the troops. The following are stated to be the particulars of the increase of the different regiments:—The 45th is to be augmented to two battalions of 600 rank and file each, and a company of African artillery, for service in Jamaica, is to be formed from volunteers from the coloured troops stationed in that island. In addition to the 10th Foot and 78th Highlanders, the 29th, 84th, and 86th Regiments are to be embarked without delay from this country for the East Indies; and the 25th is to go on to the same destination from the Cape of Good Hope. Each of these corps, as well as all the Queen's Infantry regiments borne upon the Indian establishment, are to be augmented to 1,000 rank and file. The increase to the six regiments just specified will consist principally of volunteers from the line at home, who are to be permitted to transfer their services, in certain proportions, receiving a bounty of 30s. per man. The 9th Lancers have likewise received orders to hold themselves in readiness to proceed to Bengal, as soon as tonnage can be taken up for their conveyance to that presidency. The increase which is already in progress may be thus particularised:—The augmentation of 6 regiments from 800 to 1,000 rank and file, 1,200; the augmentation of 22 regiments on the Indian establishment from 976 to 1,000 rank and file, 504; total, 1,704. If the six regiments complete their full establishment in time, the whole of the ten companies of each corps will, it is said, most likely be embarked; in which case the infantry reinforcement of Queen's troops will consist of nearly 6,000 rank and file, (inclusive of the service companies of the 25th at the Cape,) besides about 650 men of the 9th Lancers, and the usual complement of officers.

Cheltenham.—A few days since it was announced that Mr. Feargus O'Connor would deliver a lecture in this town on the Charter; but when the time appointed arrived, it appeared that he had received so much injury at a riotous public meeting, recently held for the same purpose in Manchester, that he was unable to travel, and the meeting was therefore postponed.

Liverpool.—A serious fire has occurred in this town, in the extensive cotton warehouse of Messrs. Robinson and Latham, situate near St. George's Dock. From the position of the warehouses, which form a dense quadrangle filled with combustible materials, and are in the immediate neighbourhood of some of the principal mercantile buildings in the town, great apprehensions were entertained for the result, particularly as there was a strong gale of wind blowing from the north-west at the time. The fire was fortunately confined to the warehouse in which it broke out, damage being sustained to the amount of 3,000*l.*; had the range of buildings been burnt down, the loss would have been very great, the value of the warehouses, independent of their stocks, being estimated at upwards of 50,000*l.*

Newark.—A provincial paper, the "Lincoln Mercury," states, that the framework for ten new bells for the church in this town is now complete; that it has been cut out of six large trees grown in Bosworth Field; and that, while sawing the beams, the workmen cut into the heart of a tree, where the saw was obstructed by a bullet, which it is supposed had been there ever since the battle of Bosworth, in the year 1485.

Nottingham.—It is stated that the Rev. R. W. Sibthorp has subscribed 2,000*l.* towards the erection of a large Roman Catholic chapel in this town, and that he will proceed here on a mission as soon as the chapel is completed. —On Wednesday, John Jones, convicted, as stated in our last, of the murder of Mary Hallam, at Mansfield, underwent the last penalty of the law in this city.

Portsmouth.—H.M.S. the Queen, 110, Capt. Rich, with the flag of Vice-Admiral Sir Edmund Owen, the Commander-in-Chief of the fleet in the Mediterranean, and the Formidable, 84, Capt. Sir C. Sullivan, which had been detained here a considerable time by unfavourable winds, have at length been enabled to start for their destination. They got under weigh together on Monday morning, and proceeded down the Channel in company. The wind, which for the last week had been blowing from the W.S.W., veered round to the northward on Sunday evening, and has since continued blowing from that quarter. As this would enable them to go several points free, and there being a strong breeze, there is little question that they soon cleared the Channel, and should the wind hold, that they will make a very quick passage. As this is the first time the Queen has been to sea, her powers of speed and qualities as a sea-boat are at present unknown, and some interest is felt on the subject by those who have been on board of her and witnessed her great breadth of beam and extraordinary room and accommodation. The prevalent opinion is, that she will prove uneasy; for it seems that when she was lying at anchor at Spithead, and there was any swell, she used to roll and labour, while the other ships lying there were comparatively easy. The Formidable is also a new ship, but her sailing qualities have been somewhat tested in her trip round from Sheerness to Portsmouth, when she had the advantage over the Alfred frigate, which came round at the same time.—Active preparations are making throughout this district for the receipt of a large military force of several thousand men; and orders have been issued for the barracks of this garrison to be got ready for the occupation of as many men as possible. Similar instructions have been sent to the barrack-masters at Chichester, Winchester, the Isle of Wight, &c. The regiments about to be quartered here are those destined for foreign service; and some will embark as soon as the transports can be got ready to convey them to their destination. The 10th regiment, about to embark for India, will be here in a few days from Glasgow. The men will be conveyed in steam-vessels to Liverpool, and proceed to London by the Liverpool and Birmingham Railway, and thence to Gosport by the South-western line: a distance which would formerly have taken nearly a month for a regiment to march, but which by this mode of conveyance will be effected in a few days.

Stockport.—A local paper, the "Advertiser," informs us, that property of all kinds in this borough has of late been gradually decreasing to a great extent, and that double houses, which two or three years ago let for 2*s.* 6*d.* and 3*s.* per week, are offered at 7*d.* clear of all rates, in order to satisfy the chief rent, the tenant being merely required to keep the dwelling in repair. Thus the owners of cottage property will be great sufferers; for besides the houses being empty, the chief rent, of course, must be paid. In order to illustrate the extent of empty property in the township, and the amount of distress which the town is suffering, it is stated that in 1840 a rate of 1*s.* 6*d.* in the pound realised 5,000*l.*, whilst in 1842 a poor-rate of 2*s.* in the pound will only produce 3,000*l.*, showing a depreciation in two years of 55 per cent.

Worcester.—A local paper informs us that base coin produced by the action of the electrotype is extensively in circulation in this city, and that pence and halfpence, in particular, have been successfully counterfeited, having every appearance of genuine coin, by the chemical application of a solution of copper on a lead body. The deceit, however, may be easily detected by rubbing the suspected pieces against any rough substance, by which the coating will be removed.—At the Police Court in this city, a few weeks ago, a woman, with an infant in her arms, was committed to prison for cutting a small quantity of birch at Bosbury, the damage which she did being valued at one halfpenny. The child, it seems, died in prison on Sunday, and at the inquest which was held, the mother stated that it was her belief the child died in consequence of a cold caught in the Ledbury lock-up house.

IRELAND.

Dublin.—The national anniversary of St. Patrick's day was celebrated in this city on the 17th, with all the usual demonstrations of festivity. The most perfect good order prevailed, and no disturbance or any expression of party spirit occurred. The High Sheriff and Grand Jury have agreed unanimously upon an address of congratulation to his Excellency the Lord Lieutenant, expressing the utmost confidence in his paternal government. The Duke of Richmond has written a letter to the Royal Agricultural Society of Ireland, expressing his great satisfaction at the progress it has already made, the advantages likely to arise from its success on the country at large, and offering, as President of the English and Scotch Societies, their co-operation in every available manner that may be useful to it. A body of Quakers called the "Peace Society" have held a meeting in the Royal Exchange, when a petition was agreed upon, expressing "their abhorrence of the waste of life caused by the war in India, which in their opinion was occasioned by an insatiable thirst for dominion, and was a disgrace to the nation." It also prays that no more troops be sent to India; but that a peace, however disadvantageous to Great Britain, be at once concluded. —The ceremony of laying the first stone of the Centenary Wesleyan Methodist Chapel in Stephen's-green, in this city, took place on Tuesday in the presence of a numerous congregation. It seems that part of the general centenary fund for Ireland was set apart for this purpose, and Mr. Justice Crampton undertook the office of laying the first stone, and before doing so addressed the assembly in an appropriate discourse.—The consecration of the Rev. Dr. O'Brien as Bishop of Ossory took place in the chapel of Trinity College on Sunday. The officiating prelates on the occasion were the Archbishop of Dublin and the Bishops of Cork and Meath.

SCOTLAND.

Glasgow.—A melancholy accident, attended with loss of life, has happened to the Telegraph steamer, running between this city and Greenock. It appears that the boat had been lately built for the river trade for the purpose of competing with the railway. She had been plying for some time, and being on the high-pressure principle, had beat the swiftest steamers in the passage to Greenock. On Monday, about noon, a loud report was heard at Greenock, as if a battery of cannon had been discharged at Helensburgh, a distance of four miles; smoke was seen to arise in that direction, and telescopes being procured, it was discovered that the Telegraph had exploded. Two steamers lying at Greenock-quay at once sailed for Helensburgh to render assistance; and on their arrival, they found that the Telegraph's boiler had burst, and that the hull of the vessel was a total wreck, and floating away in pieces. It was immediately ascertained that 15 persons had been killed on the spot; but as strangers were on board, it was difficult to arrive at a true statement of the casualties. A number of individuals were seriously wounded, some of whom are not expected to recover. It appears that the passengers for Helensburgh had all landed, and that the boat was about to proceed on her passage up Gairloch when the explosion took place. It appears that the Telegraph at the time of the explosion was scarcely five yards from the landing place, and the concussion was so great that several persons standing on the quay were stunned, and even thrown down and struck by pieces of the flying timbers. Those near the vessel are unable, from the confusion into which they were thrown, to describe the circumstances of the explosion; but those at a short distance state that the boiler and engine, which are all in one piece and weigh about eight tons, were raised high up above the deck of the vessel, and thrown forward towards the bows, and fell alongside the quay at least 100 feet from the paddle-boxes, between which they were placed. It is also stated, as showing the great force of the explosion, that the whole mass of eight tons weight must have turned completely over longitudinally, the end of the boiler which was nearest the stern of the vessel now lying furthest in-shore. The deck was shivered to pieces; the shafts, cranks, beams, &c., sunk immediately; the funnel went by the deck, and the paddle-boxes and wheels were thrown outwards at the top to an angle of nearly 50 degrees. The wheel at which the pilot was standing had every spoke broken, and the vessel became instantly a total wreck. On Tuesday a tug-steamer was brought over from Greenock to assist in pulling the wreck to pieces, and in hoisting on board such of the iron work as could be saved.

Miscellaneous.

Natural Gas.—The Welsh papers state that about a mile and a half from Pont-y-Prid (Newbridge), Glamorganshire, a workman from the neighbouring mill about two months since accidentally discovered a natural jet of gas that issues from a small river, which rises in the valley between the Llantrissant and Dinas mountains, and flows into the Taff near the above bridge. This jet forces the water up about six or eight inches, and when lighted, burns with great brilliancy and intense heat, producing a smell resembling burning sulphur. The jet and the water around are very cold. At night the flames are four or five feet high. Five other jets have been discovered, two on one side and three on the other side of the brook, but no one of them so strong as that issuing from the water.

The Acarus Galvanicus.—In the autumn of 1837 the scientific world were surprised by the announcement that Mr. Crosse, of Broomfield, had observed insects, of a previously unknown species, come into being among certain voltaic arrangements. Among the various objections urged against their connexion with the electricity, was the possibility of ova being in the atmosphere. At a recent meeting of the Electrical Society, a paper was read from Mr. Weekes, of Sandwich, describing experiments wherein he had obtained the same species of insect in a close atmosphere over mercury, every possible precaution being taken to exclude extraneous matter. On the 3d Dec. 1840, operations commenced; at the latter end of Oct. 1841, the first insect was seen; on the 25th Nov. five were detected. Since that period they have been frequently examined. The account contains several incidents interesting with respect to the habits of these strangely-produced creatures. Simultaneously with the experiment just detailed, another apparatus was put in action in an atmosphere of oxygen gas. On the 26th Feb. 1842, eight or ten full-grown acari were observed in active motion. The solution whence these insects appear to have emerged is stated to be one of silicate of potass, made with materials transferred from a furnace heat to boiling water, and filtered under cover. It is, perhaps, fair to add, that at a late meeting of the Entomological Society these experiments were brought before the members by Mr. Newport, when Mr. Gray, of the British Museum, expressed doubts of the possibility of their production, as similar experiments had been made by Mr. Children, of the same establishment, but without any success.

United States Debts.—The New York Journals brought by a recent steamer contain the latest statistics that have been published upon the subject of the United States' debts. They are as follows:—Maryland, 15,213,184 dollars; Mississippi, 7,500,000; Indiana, 15,289,146; Michigan, 5,000,000; Illinois, 17,846,130; Arkansas, 3,600,000. These States are at present under suspension: Maine, 1,700,000; Massachusetts, 7,372,839; New York, 26,652,263; Pennsylvania, 26,326,239; Virginia, 8,253,130; South Carolina, 5,560,000; Georgia, 1,460,930; Florida, 3,500,000; Alabama, 10,859,536; Louisiana, 24,530,270; Tennesse, 3,516,916; Kentucky, 3,401,500; Ohio, 17,119,820; Missouri, 1,289,000; Winconsin, 100,000; United States, 14,728,085 dols. The total is 228,898,948 dollars. The States without debt are Vermont, New Hampshire, Rhode Island, Connecticut, New Jersey, Delaware, and North Carolina. In addition to the above large amount, nearly 48,000,000*l.* sterling, the city of New York owes 9,663,000; Baltimore, 5,318,625; Boston, 1,800,000; Philadelphia, 3,000,000; New Orleans, 1,758,000; Charleston, 1,142,000; Cincinnati, 1,140,000; Albany, 395,532; Mobile, 513,000; Troy, 361; Savannah, 347,216: and Buffalo, 64,500 dollars; making a total of 25,502,873 dollars; or, with the States' debts, a sum equal to about 55,000,000*l.*, besides the obligations of several other cities, the returns from which are not furnished.

Chinese Agriculture.—The agriculture of China is stated to be the best in the world. They are familiar in that country with the relative value and efficiency of the various manures, and understand how to prepare and apply without loss that which is best fitted to sustain each kind of plant. It is in this direction that the inquiries of the chemist are likely to be productive of advantage to European agriculture. The practical farmer already knows that one ton of bone-dust is equal to 14 tons of farm-yard manure. Some of the most skilful living chemists predict that methods will hereafter be discovered of even pressing into a still less bulk the substances required by plants, and that we shall live to see extensive manufactories established for the preparation of these condensed manures.—*N.*

Photographic Portraits.—A great improvement in photographic art has recently been introduced by an invention of Mr. Fox Talbot, for which a patent has been taken out. The improvement consists in the portraits being taken on paper, instead of on metallic plates, of their being indelible, of the great accuracy of likeness, the breadth of light and shade, the general pictorial effect, and the capability of the portrait being multiplied into many copies or *fac-simile* representations, without the sitter being required to sit for each portrait. They resemble sepia drawings, are exceedingly true, and the sitting requires but a minute, or two minutes, according to the brightness of the day. The paper is prepared with salts of silver, and subjected, by an apparatus furnished with glasses, to the rays of light, and the likeness is, as it were, absorbed by the paper. The process is called the "calotypic" process; it affords curious evidence of the agency of light in effecting chemical changes, and shows how science may be made subservient to the advancement of the fine arts. The portraits obtained by this invention may be placed in portfolios or suspended in frames, and the faithfulness of resemblance may be relied on. There is no distortion of feature, and none of that hardness by which common photographic portraits are disfigured, and being on paper, defects may be amended by the pencil of the artist, and additions introduced by which a picture as well as a mere portrait may be secured.

Antiquities.—On Saturday afternoon, as the men employed in the erection of the new sewer in the Strand were excavating the ground in the front of St. Clement's church, they found, at a depth of about a foot and a half from the surface, a large number of human skeletons, many of them in perfect condition, and, in one instance, a skull of a woman, with a large quantity of hair attached. A leaden coffin and other remains have since been discovered. The

circumstance attracted a large number of persons, and it is supposed that the ancient burial-ground of St. Clement Danes once covered the spot in question.

Law.

HOUSE OF LORDS.—*Appeals.—Baird and others* v. *Neilson and others.*—This was an appeal against a decree of the Court of Session, given under the following circumstances:—The respondent, Mr. Neilson, claimed to be the inventor of a new application of air to produce heat in smelting-furnaces and other places; and the appellants had taken from him and the other respondents (partners in the patent) a license to use the patent. The terms of payment became afterwards a subject of dispute between the parties; and the respondent, among other legal proceedings, obtained from the Court of Session a decree interdicting the appellants from the use of the said patent until they had found security for the loss and damage which might accrue to the respondents from the use of the same during the continuance of these legal proceedings. The appellants made this decree the subject of appeal. The whole case depended on the terms of the agreement between the parties. The Lords held that, under the terms of the agreement, the appellants were bound to pay for the use of the patent both before and since the date of that agreement, and that the decree of the court below was right, and must be affirmed, with costs.

COURT OF CHANCERY.—*In re Yorke.*—This was a petition to discharge an order of Lord Cottenham, which charged the estate of a deceased committee of the lunatic's estate with interest at 5 per cent., and annual rests on the amount of the lunatic's property, of which he had not passed any account since the year 1815. They admitted that the committee, who was the uncle of the lunatic, could not hope to escape the payment of interest, but that it ought to be 4 per cent., and without rests. The uniform practice was to charge no more, and the court, by charging 5 per cent. in the present case, established, without any warning or notice, an entirely new principle. There were too many extenuating circumstances in the case. The money was difficult to get in, more than the allowance had been expended on the lunatic's maintenance, and if the accounts had been passed yearly an expense of 20*l*. or 30*l*. a year would have been incurred, to the prejudice of a very small income. The Lord Chancellor feared that expense was not much overrated. His lordship had of late looked at a number of bills connected with the management of lunatics' estates, and in one instance he found a bill of costs containing full eleven hundred items, from the date of the issuing of the commission to that of the fixing the amount of maintenance. Nothing, his lordship said, had been shown to induce him to disturb the order. The case was perhaps a hard one, but if the money had been invested in the public funds, the interest would have been paid half-yearly, and re-invested, so that the rests would have been half-yearly ones instead of annual. Nothing, too, had been proved with respect to the profit derived from the use of the money by the committee. The order must be affirmed, but his lordship guarded himself against affirming the principle of an interest of 5 per cent. in such cases.

Cockburn v. *Raphael.*—This is an appeal from the Vice-Chancellor. An Armenian merchant, named Raphael, bequeathed, in the year 1791, a considerable sum for the purpose of founding a school, to support and educate, in a decent manner, such a number of poor Armenian children as the funds would allow; but in the first place he directed the General History of Rollin to be translated into the Armenian language, for the benefit of his countrymen. The history has been translated and published, and the school has been founded at Venice, under a scheme settled by the master and approved of by the court in 1834. Of this school the abbot of the convent of St. Lazarus is visitor, and three of the monks preceptors; but it has been found that a smaller number of boys is educated than the funds would allow, and that expenses are incurred which, it is thought, the court would not sanction. The income annually arising from the fund is now 1,390*l*., and the boys educated have never at any time exceeded 14 in number, being a charge of 57*l*. for each boy. It is contended that a sum of 25*l*. would be amply sufficient to clothe and educate boys in Venice, and that as it was the manifest intention of the founder to give an extensive influence to the charity, with a view to the advancement in civilisation of the Armenian nation, through the instrumentality of these boys, it is now expedient to review the scheme, so as to effect such improvements as may be found necessary in compliance with the trusts of the will of the founder. The Vice-Chancellor was of opinion that no maladministration of the charity had been proved, and refused to interfere.—The Lord Chancellor postponed the further hearing till the next day of the sittings of the court, and rose for the holidays.

VICE-CHANCELLOR'S COURT.—*Thorby* v. *Yeats.*—This was a suit by a married woman by her next friend against certain trustees for the transfer of a legacy of 1,000*l*., given to her separate use, and for the costs of the suit occasioned by their refusal to make such transfer. A testator by his will, dated in 1825, gave to his sister and two of the defendants, the present trustees, 1,000*l*. Three per Cent. Consols, upon trust to assign the same to the plaintiff, his niece, at the age of 21 years, for her separate use, and in case she should die under 21, then the fund to fall into the residue of his estate. The plaintiff attained the age of 21 years in 1835, but the fund was not then transferred to her. In 1838 she married, no settlement being made thereupon. The dividends were paid by the trustees to her from the time of her attaining her majority to the period of the filing of the bill. An application was made by the solicitor of the plaintiff for a transfer of the fund, but after various delays the trustees declined to make the same, on the ground of the then unsettled state of the law, as they asserted, in the early part of 1839, respecting separate estates of married women. It was agreed, after some negotiation, that the matter should stand over until the Lord Chancellor (Lord Cottenham) should give his decision in the cases on this point then depending in the Court of Chancery. In March 1840, Lord Cottenham gave his decision in "Tullett *v.* Armstrong," by which the point was set at rest, that a married woman having property circumstanced as in the present case took the same wholly independent of her husband. Endeavours were again made to obtain a transfer, but without effect, and the bill was accordingly filed. The defence made was, that the trustees were not bound to act without the sanction of a court of equity, they having promised the testator not to make the transfer without being compelled so to do. His Honour decreed that the fund should be forthwith transferred, that the legacy duty should be paid, that the arrears of the dividend should be paid, that the trustees should pay the costs of the suit, except those occasioned by the taking of evidence, which were to be paid by each party, and that the plaintiff should pay the costs of the husband, and get them over from the trustees.

Ivatt v. *Watford.*—In 1839 an Act of Parliament was passed for enclosing certain commons and open fields in the parish of Rampton, in Cambridgeshire, under which the defendant, Mr. Watford, was the commissioner. The plaintiff, Mr. Robert Ivatt, made a claim to an allotment in respect of a moiety of the pasturage of the open fields and commonable lands in the parish which he had long possessed in right of the manor farm in the parish of which he was the owner. Mr. Watford investigated the claim, and disallowed it. The plaintiff then brought an action upon a feigned issue under the 19th section of the Act, for the purpose of establishing his title, but failed in the attempt. After this Mr. Watford was about to make his award, when the plaintiff filed this bill, alleging that all these proceedings were erroneous, and that Mr. Watford had no right to interfere against his possession of the pasturage, and that the proceeding by a feigned issue was inapplicable to the case; and the bill prayed an injunction to restrain Mr. Watford from making his award until the questions upon the plaintiff's title should be determined in a proper manner. A motion was now made for the injunction. It appeared the 16th section of the Act enacted that the commissioner should not have power to determine any question relating to the title to lands, or the right between parties contrary to the actual possession of such parties; and if he should be of opinion against the right of any party in possession, he should forbear making his determination until the possession should have been given up, or should have been recovered by due course of law. Several affidavits were produced, from which it appeared that two flocks of sheep under separate shepherds, one called the manor flock, which was attached to the manor farm, and the other called the town flock, which belonged to the copyholders, used to depasture on the lands in question, and that the flocks changed their ground daily, and that there was no particular number in the flocks, but that they had equal rights of pasturage. The defendants, who were some of the copyholders of the manor, denied the plaintiff's right to pasturage in the manner he had claimed it, and insisted that the commissioners had come to a right conclusion, and that the action which the plaintiff had himself brought had determined the question. His Honour observed that the language of the 16th section was not exactly applicable to this case, which was a claim, not to land, but to commonage. The plaintiff might give up the commonage, but it could not be recovered from him. He thought, however, the words of the statute would be sufficiently satisfied if it should appear that a party could not sustain his right, which in this case was in the nature of a claim to common without stint. Now, that the plaintiff had been in possession of such a right, must be admitted. And the section attributes a certain value to possession. Strictly speaking, upon a fair interpretation of the section, the commissioners could not make any adjudication. There was no imputation on the conduct of Mr. Watford. The party who now said he had no jurisdiction, had absolutely thrust that jurisdiction upon him. There had been a mistake, and as this Court does not hold parties bound by a mistake, the matter must be put in a course of trial. The injunction must go. The mode of trial might be settled on a future day, after a little consideration whether the parties could agree upon the course to be adopted.

Attorney-General v. *Cullum—Same* v. *Le Grice.*—This was an application on behalf of the relators in this matter, which came on upon the Master's report and for further directions, and also upon a petition. The charity is called "the Guildhall Feoffment of Bury St. Edmund's," and was originally established in the latter part of the 14th or the beginning of the 15th century. It continued to be increased by gifts, devises, and bequests, made by a great variety of benefactors for the 300 years succeeding, and at the present day yields an annual revenue of upwards of 2,100*l*. Many portions of these gifts, devises, and bequests were for what are termed superstitious uses, and were therefore void; other portions were for the repairs of the churches of Bury, and other parts for the aged poor inhabitants of the town generally. In 1833 the information was filed by the Attorney-General at the relation of certain inhabitants of Bury, in which numerous charges of mismanagement were brought forward against the feoffees, and in 1836 it was referred to the Master to inquire and ascertain, amongst other things, the amount of the property, and to approve of a scheme for the future management of the estates and application of the income. The chief point of interest in the case was that the Master had found that it would be proper to build and support three schools in Bury out of the surplus income—namely, a commercial school, for the instruction of 150 boys; a poor boys' school, for the instruction of 300 boys; and a poor girls' school, for the instruction of 150 girls. The Master's report left it to the trustees to appoint masters and mistresses, without stating of what religious persuasion they should be, and went on to provide that a sufficient and convenient portion of the stated school-hours should be set apart daily for reading the Scripture lessons prepared for the use of the Irish National Schools, and the authorised version of the Scriptures, or such part thereof as the trustees should think proper; and that no other religious instruction should be introduced into the school. The defendants, who were some of the trustees, objected to this, and proposed that it should be declared by the court that the masters and mistresses should be members of the Church of England, and that the Scripture lessons prepared for the use of the Irish National Schools should not be made part of the scheme. His Honour observed that if there was to be any education, it must clearly be accompanied by instruction in religion, for without religion education would be a by-word and a mere mockery. If there were to be education, and therefore instruction in religion, what possible standard could the court have, or with propriety adopt, but the established religion of the country? Suppose the schoolmaster to be a conscientious Anabaptist, what then? Was there to be no exposition of the Scripture? If there were to be, then the parties must look out for some gentleman professing all the tolerated religions in the country. A master not believing in the doctrine of the Trinity might be called on to interpret such portions of the Scripture as related to that doctrine, and he might do that which was unfortunately but too general with regard to the Bible—namely, skip those parts which present the difficulty. His Honour could well understand the argument that no part of the funds of the charity should be applied to the purposes of education, that would be plain, clear, intelligible, and easy of comprehension; but it would be worse than mockery to say that there should be education without religious instruction. If it was to be held that religious instruction was to be given, the court could see no guide, no standard by which it could be governed, but by the Established Church. If any other were adopted, the varieties of religions taught would be as infinite as the changes of dissent were perpetual. He wished it, however, to be distinctly understood, that the ground on which he proceeded was not in consequence of any preferences which he had for the Established Church, but from the absolute necessity of the case. His Honour concluded by saying that, unless counsel had anything to suggest in which all parties agreed, what he must do would be to refer everything back to the Master, as far as regarded education.—Mr. Cooper, the counsel for the relators, said that both parties had agreed to the introduction of the following clause:—They agreed, first, that the masters and mistresses were to be members of the Church of England. That during one hour at the least of every school-day the master shall give religious instruction to all the scholars, such religious instruction to be confined to the reading and explanation of the Scriptures; and he shall give instruction in the doctrines and principles of the Church of England to such of the boys whose parents are in communion with that Church, and the scholars shall be required to repair twice every Lord's-day to Church, or other place of public worship, according to their several creeds, and those who attend Church shall go along with, and be accompanied by, the master."—His Honour said that the instruction on the Lord's-day must be specifically described as "instruction relating to the Liturgy, Catechism, and Articles of the Church."—Mr. Cooper said that they had also agreed to insert this proviso—"Nevertheless any two trustees, by a note in writing, may excuse from attendance at Church any of the scholars who were children of parents not in communion with the Church of England."—His Honour said that if the parties had not agreed, he should have had considerable difficulty in directing any education at all, and therefore he thought they had exercised a wise discretion in coming to this arrangement. The result, therefore, was this: All the teachers were to be members of the Church of England, by which alone he meant that religion could not be taught without interpretation. This Court must state some interpretation, and there would be insurmountable difficulties in stating any interpretation, except that according to the Established Church.

ASSIZE INTELLIGENCE.—*Oxford Circuit.*—John Williams and Joseph Slawson were tried at Shrewsbury on Monday, charged with the murder of Emma Evans, on the 16th Dec. last. A full account of the circumstances connected with the murder appeared in this Paper at the time. It will be remembered that deceased was an old woman living by herself at a place called Brookside about five miles from Oswestry, and that she was discovered on the evening of the day mentioned in the kitchen, with her throat cut and the house robbed of everything valuable it contained. The prisoners were traced by the testimony of numerous witnesses to the neighbourhood of deceased's house about the time the murder was committed; articles belonging to deceased were, after their apprehension, found on their persons, and a sufficiently strong chain of circumstantial evidence appeared clearly to connect them with the commission of the crime. In addition to this, they had both, since their apprehension, made voluntary statements, giving different accounts of the transaction, each endeavouring to criminate the other, but both admitting that they were the sole perpetrators of the crime. Slawson stated that he was present at the time of the murder, but denied that he had partaken in any way in the violence which had been offered to deceased, attributing that to his companion alone. The jury found the prisoner Williams guilty of the murder, and acquitted Slawson. Mr. Justice Pattison, with the usual solemnities, then passed sentence of death upon Williams: after which Slawson, who from the evidence appears to have been the chief originator of the plan for robbing deceased, was charged with the robbery, his confession being admitted in evidence against him; he was convicted, and sentenced to transportation for 7 years.

TATTERSALL'S, THURSDAY.—None of the Derby favourites were in force, nor was the general betting by any means brisk. 8 to 1 was laid to about 300*l*. agst Attila, and from the feeling displayed in various quarters, a further decline was considered probable. Neither Auckland nor Chatham were in favour, the odds quoted against each having been offered currently; Ballinkeele had a formidable enemy, notwithstanding it was stated that his arrival in Oxford-street may be hourly expected. In fact the only movement upward deserving of mention was in the Lord of Holderness, in whose favour the last offers to lay did not exceed 20 to 1. Very little money was got on. Palinurus and Espartero improved a little, and 2,000 to 15 was taken several times about Belcœur. Nothing fresh either in Chester Cup or Oaks. Closing prices:— 2,000 GUINEAS STAKES.

6 to 1 agst Mr. Bowes's Meteor (taken)

GAZETTE OF THE WEEK.

INSOLVENTS.—S. P. Gladstone, Crisp-street, East India-road, Poplar, shipwright—F. Barker, Chiswell-street, Finsbury, carman—W. Filmer and W. S. Gooding, Osborne-street, Whitechapel, brewers—J. Radford, Appleby, Westmoreland, draper—W. J. Nettleton, West terrace, Upper Grange-road, Bermondsey, corn-dealer—W. P. Bothams, Tong, Shropshire, maltster.

BANKRUPTCY ENLARGED.—E. Warne, Lisle-street, Westminster, carpenter—E. and C. C. Manning, High-street, Aldgate, drapers—C. Caswall, Woburn-place, Russell-square, lodging-house-keeper—J. M. Gipps, Duke-street, Grosvenor-square, wine merchant.

BANKRUPTCIES SUPERSEDED.—J. Sharpley, Coates Grange, Lincolnshire, miller—J. Stevens, James-street, Limehouse, brickmaker—T. Berriman, Peckham-grove, Surrey, builder.

BANKRUPTS.—J. W. Nevill, Bread-street, Cheapside, Manchester-warehouseman—W. Cannabee, Camberwell-green, Surrey, bookseller—J. Gale, sen., and J. Gale, jun., Love-lane, Shadwell, rope-makers—J. H. Arnold and W. H. Woollett, Clements-lane, ship and insurance-agents—R. Brownlow, White-street, Finsbury, silk-dresser—J. East, Kingsthorpe, Northamptonshire, carpenter—J. Woodhead, Duckmanton, Derbyshire, cattle dealer—E. Steele, Manchester, grocer—E. J. King, Oxford, manufacturer of artificial teeth—J. Warren, Bristol, merchant—J. D. Gorely, Bristol, toyman—A. Buckley, Newton Moor, Chester, grocer—J. Barlow, Lichfield, ironmonger—J. Thornton, Leicester, builder—T. Little, Kingston-upon-Hull, tobacco-manufacturer—J. Lockley, Bilston, Staffordshire, painter—W. Morris, St. Clears, Carmarthenshire, general shopkeeper—R. Bill, Birmingham, japanner—J. Webb, Birmingham, tailor—F. and C. Sandars, Derby, corn-merchants—T. Charnley, Preston, Lancashire, innkeeper—T. Walker, Monkwearmouthshore, Durham, brewer—D. Nutt, Stratford-green, Essex, merchant—C. Graydon, St. Ann's-place, Limehouse, timber-merchant—D. S. Walker, Great St. Helen's, City, india-rubber-manufacturer—J. A. Wood, Worcester, chemist and druggist—H. Wickham, Bristol, linendraper—W. Darlington, Liverpool, wine-merchant—R. Turvill, Kingston-upon-Thames, baker—P. Lowe, Chester, shoemaker—R. Turner, Oldham, Lancashire, flour-dealer—E. Young, Birchington, Kent, blacksmith—T. Thomas, Leintwardine, Herefordshire, miller—J. Bennett, Manchester, calico-printer—J. Cunard and J. Ingram, New Bond-street, merchants.

SCOTCH SEQUESTRATIONS.—J. Hamilton, jun., Stonehouse, victualler—A. Young, Broomielaw of Glasgow, wine-merchant—D. Russell, Uddingstone, Lanarkshire, founder—H. Mithell, St. Ninians, Stirlingshire, grocer—J. Hosie, Nitshill, quarrier—W. Bell, Greenock, ironmonger—T. Saunders, Alloa, grain-merchant—W. Lees, Glasgow, merchant.

BIRTHS.—On the 8th ult., at Coblentz-on-the-Rhine, the wife of Dr. J. D. Yonge, resident physician, of a son—On the 17th inst., at Beddington, Surrey, Mrs. G. Engstrom, of a son—On the 17th inst., at the residence of J. W. D. Johnson, Esq, Cook's-court, London, the wife of Mr. R. Walker, of the Ordnance Department, Waltham Abbey, of a daughter—On the 18th inst., in Upper George-street, the lady of H. Barlow, Esq., of Mauritius, of a son—On the 19th inst., at Parkhurst, Bexley, the wife of Major Cruikshank, of a daughter—On the 19th inst., at Devonshire-street, Queen-square, Mrs. C. Arrowsmith, of a son—On the 20th inst., in Hertford-street, Mayfair, the lady of W. B. Evans, Esq., of a daughter.

MARRIED.—On the 19th inst., at St. Mary's, Islington, Mr. J. Ayers, jun., of Peckham, Surrey, to Mary Anne, youngest daughter of the late J. B. Page, Esq., of Ludham-hall, Norfolk—On the 19th inst., at Twickenham, the Rev. G. Brown, of Sloane-street, Chelsea, to Miss Alldridge, of Twickenham common—On the 20th inst., by special licence, in Albemarle street, Sir Robert Wilmot, of Osmaston, Bart., to Margaret, widow of the late R. Algeo, Esq., and youngest daughter of the late Rev. A. Keasternan, of Brenchley, in the county of Kent, and rector of Bermondsey, in Surrey.

DIED.—On the 20th inst., at her residence, Lincoln's Inn-fields, Lucretia Green, only daughter of the late J. Bellamy, Esq.—On the 20th inst., at his town residence, in Conduit-street, the Earl of Macclesfield—On the 12th inst., at his residence, in the city of Coventry, W. Griffin, Esq., in his 89th year—At Ramsgate, on the 19th inst., after a few days' illness, Mary Ann, wife of J. Overbury, Esq., of Balham-hill, in the 34th year of her age—On the 19th inst., in his 56th year, J. Hardcastle, Esq., of Hatcham House, Surrey—On the 21st inst., at Erle Cottage, Bow, Mr. W. D. Anderson, aged 33, late engineer to the corporation of Newcastle-on-Tyne, and only son of Mr. W. Anderson, engineer of the Grand Junction Waterworks—Yesterday morning, Sir William Beatty, M.D., Physician to the Fleet, and to Greenwich Hospital, and surgeon to Lord Nelson at Trafalgar.

T. C. WILDMAN, Hon. Sec.

Crown and Anchor Tavern, Strand,
28th March, 1842.

T. JACKSON, Nurseryman, &c., Kingston, Surrey, respectfully informs his Patrons and the Admirers of Horticulture, that his Supplement CATALOGUE OF PLANTS, with their prices, for 1842, and his List of Choice Show DAHLIAS, may be obtained on application.

Kingston Nursery, March 17th, 1842.

ARAUCARIA IMBRICATA.—Fine strong Plants two years old, from 5in. to 6in. high, of this most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREE are now selling at Messrs. YOUELL'S NURSERY, GREAT YARMOUTH, at 63*s*. per dozen, or 25*l*. per 100. Also Cedrus Deodora, 4in. to 6in. 63*s*. per dozen; Do. do., 8in. to 10in., 84s. per dozen. Specimens may be seen and orders taken at their Agents', Messrs. Flanagan and Co., No. 9, Mansion-house-street; and Messrs. Noble and Co.'s, 152, Fleet-street, London.

Great Yarmouth Nursery, March 31, 1842.

SEEDLING CINERARIAS AND VERBENA.

WILLIAM IVERY, FLORIST, PECKHAM, near London, begs respectfully to inform the Public that he has a few more blooming plants of his Cinerarias, Rival King, Royal Blue, Imperial Blue, and Queen Victoria, pure white, at 3*s*. 6*d*. each; also, Verbena, Queen, pure white, at 7*s*. 6*d*. each. For particulars, see *Gardeners' Chronicle* and "Gazette" 19th inst., and "Floricultural Cabinet." Catalogue of all the newest Fuchsias and Verbenas can be had on application.—P.S. Verbena can be forwarded by post.

J. MITCHELL, PILTDOWN NURSERY, Maresfield, Uckfield, Sussex, begs respectfully to acquaint his friends and the public he intends sending out in May his two superb seedling DAHLIAS, viz., "SNOWFLAKE," pure white, occasionally tipped with beautiful lavender, cupped petals and first-rate show flower (strong plants the first week in May) 4 feet, 10*s*. 6*d*.; and "MRS. SHELLEY," beautiful rosy pink, cupped petals, and superior shape (strong plants the third week in May) 4 feet, 15*s*.—March 22, 1842.

NEW AND SUPERB FUCHSIAS.

THE Nobility, Gentry, and Florists, are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s*. per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

FLOWER-SEEDS.—Thirty-six Packets of the most approved Annual, or Hardy Biennial and Perennial Flower-Seeds, for 10*s*., or Eighteen Packets 5*s*., forwarded, postage free, to any part. Apply to Mr. Brown, Curator, Botanic Garden, Colchester; and to prevent disappointment, any preferred species should be specified in the order.—April 2, 1842.

CARNATIONS and PICOTEES.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL can supply the above Flowers at the following prices. Their collection is the most extensive and select in the kingdom, and for strength and healthiness are unrivalled. They beg to state that none but first-rate show flowers will be sent out.

12	pairs of fine	Show Flowers,	by name	£1 10*s*. 0*d*.
25	do.	do.	do.	3 0 0
12	do.	extra fine	do.	2 10 0

Amongst which will be included a pair of that splendid Red Picotee ANACREON.—Great Yarmouth Nursery.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, FUCHSIAS, DAHLIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers will be ready in April, including:—Fuchsia, Conspicua arborea, raised by S. R. Prouse, Esq., which will be let out in May, at 10*s*. 6*d*. per plant, of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation, or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out and expanding bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Also two new and distinct Verbenas, Ne Plus Ultra, and Elegans. Dahlia, Lady Ann Murray, a beautiful mottled white, tipped with bright rosy purple, a well-formed flower, with fine centre, one of the most constant Dahlias grown, desirable to the most limited grower, 3 feet, 10*s*. 6*d*.—Hans-street, Sloane-street, Chelsea.

MYATT'S BRITISH QUEEN-STRAWBERRY.

J. and W. MYATT beg to return their sincere thanks for the very liberal patronage they have received from the Nobility and Gentry, and to inform those who have not yet favoured them with their orders, that the approaching season is most desirable for planting; they can supply plants of the British Queen and Eliza Strawberry, the former at 5*l*., the latter at 1*l*. per 100.

The unpropitious state of the weather for late autumn-planting induces them to inform those who have been purchasers, that they will be happy to reinstate any that have not succeeded, by direct application to the parties who have supplied them, such application to be limited to April. Plants carefully packed and forwarded to any part of England.

Manor Farm, Deptford, March 31, 1842.

SALTHILL NURSERY, near WINDSOR.—A. J. STEWART respectfully informs the Nobility, Gentry, and the Public, that his descriptive Catalogue of new and choice Geraniums, Camellias, Fuchsias, Verbenas, Dahlias, Pansies, Calceolarias, Roses, miscellaneous Greenhouse Plants, Picotees, &c. &c., may be obtained by a prepaid application as above, and enclosing two postage stamps.

A. J. S. embraces this opportunity to apprise the cultivators of CAMELLIAS that he can furnish a few more assortments as offered by him on the 12th February in the *Gardeners' Chronicle*, excepting that Tricolor of King will be substituted for Lady Henrietta.

Good plants of Hardenbergia macrophylla, at 7s. 6d.

GIO. MARSANO begs to inform the Nobility and Nurserymen of the three kingdoms that he has received from Italy 200 Orange-trees. One case, with 53 named trees, may be inspected at the London Docks. Also 600 plants of Catalonian Jasmine, and Italian Tuberose roots. 120 middling-size named Orange-trees for the trade, and Jasmine plants, may be seen at G. Marsano's, Oilman Seedsman, and Florist, 2, Beauchamp-street, Brook's Market, Leather-lane, Holborn, London.

THOMAS CRIPPS, FLORIST, TUNBRIDGE-WELLS, respectfully informs his Friends that Plants of the New White Fuchsia "VENUS VICTRIX" will be ready the first week in May, at 21*s*. each, with the usual discount to the Trade, if three or more Plants are taken at once. For particulars see Floricultural Cabinet for March, or Gardeners' Gazette or *Chronicle* of 5th inst. Orders for this will be received by Mr. George Charlwood, 14, Tavistock-row, Covent-garden; Messrs. Cormack and Co. New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood & Son, Maresfield Nursery; or addressed as above.

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seeds), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers who supply this unequalled market.—4, Great Russell-street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, White Carrot, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

Ladies and Gentlemen not acquainted with the best varieties of Flower-seeds had better leave the selection to J. K., they naming the amount they would like to go to, and mentioning what assistance in the way of heat they have for the more tender or half-hardy annuals.

BIANCA DAHLIA.

I HAVE allowed a week to elapse in replying to the Advertisement which appeared in the *Gardeners' Chronicle* of the 19th of March, under the impression that the omission of the Advertiser's name was accidental. Having disposed of the Flower (as publicly advertised), and having no interest in or control over it, I might not be able, under *any* circumstances, to make an engagement to show it; and I shall most assuredly not enter into any agreement with an anonymous challenger, from whom there can be no guarantee that he would not ultimately shrink from his own proposal, screened under cover of his cautious secrecy.

The attempt to injure, in an indirect manner, the purchaser of Bianca, is not manly; and in the event of the omission to which I have adverted being supplied, I shall make such a reply as I have no doubt will be perfectly satisfactory, and will remove any idea that the competition is avoided.

J. C. WILDMAN.

Camberwell, March 30, 1842.

WANTS a Situation as UNDER GARDENER, or GARDENER, a respectable young Man, aged 23, with a good character from his last place. Direct to W. S., Mr. Cornwall's, Cornchandler, Wandsworth Road.

WANTED a Situation as GARDENER, a married Man, aged 38. Can take the entire management of a Garden with a Greenhouse and Frames, or take charge of Cows, and can be well recommended. Address William Forster, at Mr. Bance's, Butcher, Croydon. Terms 1*l*. per week.

WANTS a SITUATION as GARDENER, or GARDENER and FORESTER, a Single Man in the prime of life, who has lived in the first-rate establishments, both in England and Scotland. Any Nobleman or Gentleman in want of a confidential servant would not find themselves disappointed in the advertiser. He will be well recommended from the family he has just left. Address T. H., *Gardeners' Chronicle* Office. No objection to go on the Continent.

TO NOBLEMEN AND GENTLEMEN.

WANTS a Situation as GARDENER, or Gardener and Bailiff, a Single Man, aged 32, who is competent in the different branches of his profession—viz.: Early Forcing, Kitchen Garden, New Ground Work, Draining, New Fencing, Plantation and Timber Work, and has a thorough practical knowledge of the Durham Breed of Cattle, and Farming Line in all its branches. The most respectable ten years' reference will be given, and security to any amount required. Address A. B., *Gardeners' Chronicle* Office.

WANTED by a single man 38 years of age, a SITUATION either as GARDENER in a Nobleman or Gentleman's Family, or as FOREMAN and PROPAGATOR in a Provincial Nursery, having had extensive practice in every department, and having lived in families of the highest respectability with several men under him. The advertiser has solely conducted the business of a provincial nursery these three years, with considerable practice in the seed trade, and would accept of a similar situation. He has been used to attend on company, and would have no objection to any part of the United Kingdom. He can give the most unexceptionable reference as to character and ability. Direct G. W., Post-office, Halesworth, Suffolk. N.B.—Time will be allowed for distant letters.

SEYMOUR'S SUPERB SOLID WHITE CELERY.

H. LANE and SON, Great Berkhampstead, Herts, having received the most flattering testimonials of the great estimation in which the above celebrated CELERY is held, and of the general satisfaction felt by those to whom they supplied the seed last year, are happy in being enabled again to offer it for sale in packets at 2s. 6d. each, including postage. An early application is recommended, as the stock is getting limited

N.B.—The usual allowance to the trade.

ROSES.—H. L. and SON take this opportunity of acquainting the Nobility and Gentry, that they have an extensive collection of Bourbon, China, Tea-scented China, Noisette, and other ROSES, in pots; catalogues of which, as well as others, may be had (free of postage), on application by letter or otherwise.

R. JEFFRIES and SON take this opportunity of announcing to the Admirers and Cultivators of the DAHLIA, that they intend sending out in May their beautiful Seedling Lilac, "Lady Harland," which has been pronounced by all the principal growers that had the opportunity of seeing it, as being decidedly the best Lilac Dahlia that has yet been offered. Height 4 ft., habit excellent, very thick petal, and beautifully cupped flowers, large without coarseness, on long stiff stalks, showing itself bold above the foliage. As a guarantee for its quality, it was exhibited last September, and obtained prizes at the three grand metropolitan open shows, the Royal South London, the Floricultural Society of London, and at the Grand Salthill Show. Price 10*s*. 6*d*.—Ipswich Nursery, March 31, 1842.

N.B. No orders will be attended to from unknown Correspondents without a remittance.

JOHH HARRISON, NURSERY, SEEDSMAN, and FLORIST, YORK (formerly of Rosehill Nursery, Yarm, and the raiser of the first cupped Dahlia "Beauty of Cleveland," in 1827), takes this opportunity of informing the cultivators of the Dahlia that his Catalogue is now ready, comprising nearly all that is worthy of being grown for competition; and he flatters himself that his List will be found not only interesting but useful to Amateurs, by its giving a faithful description of each variety, and the soil best adapted for the production of perfect blooms. J. H. pledges himself to supply those friends who may kindly favour him with their orders, with strong healthy plants well hardened, and fit to turn out early without the risk of being checked by a sudden transition from the propagating-house into the open air.—York, March 23, 1842.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s*. 6*d*.

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s*. 6*d*.

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s*. 6*d*.

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

BROWN'S MARQUIS of LANSDOWNE DAHLIA.—This most essential Show Flower will be sent out in May next. Colour, shaded salmon; fine cupped petals, which are beautifully arranged; and one of the most constant and successful Dahlias of the season, having obtained Seven Seedling Prizes, three of which were first, and twice defeating "Conqueror of the Plain." Also shown in three successful Stands of two 24's, and 12 blooms for three 20*l*. prizes. A drawing was made by Wakeling, for the *Florist's Guide*, March 1842.

T. B. has a few strong Plants on hand of his much-admired Seedling PANSIES the "Countess of Orkney" and "Jewess," at 7*s*. 6*d*. each.

A CATALOGUE, containing a choice selection of DAHLIAS and HEARTSEASE, is now ready, and may be had on pre-paid application.—Slough, March 2d, 1842.

HUGH LOW & Co., NURSERYMEN, &c., UPPER CLAPTON, LONDON, beg to inform their Friends and the Public, that they will have Plants of the undernamed DAHLIAS ready for delivery in May, all of which they believe to be first rate show flowers :—

Sir John Astley (Squibb's), purple	4	1	0
Sir William Middleton (Gaines')	4	1	0
Springfield, Purple (Gaines')	4	1	0
Springfield Rival (Inwood's), crimson	5	1	0
Stuart Wortley (Barratt's), rosy purple	3	1	0
Suffolk Hero (Girling's), maroon	5	1	0
Susiana (Girling's), scarlet, tipped with white	4	2	0
Tournament (Catleugh's), scarlet	4	3	6
Unique (Ansell's), yellow, tipped with bronze	4	1	0
Unique (Walters'), white, tipped with rose	5	2	6
Uxbridge Magnet (Catleugh's), mottled purple	3 to 4	2	6
Viola (Harris'), light purple	4	1	0
Wallace (Evans'), maroon, shaded with purple	4	1	0
Will Watch (Girling's), claret, shaded	3	1	6
Windmill-hill Rival (Mitchell's), white, tipped with purple	5	1	0
Windsor Rival (Begbie's), scarlet	4	1	0
Yellow Climax (Wildman's)	3	3	6
Yellow Defiance (Cox's)	4	1	6

W. J. NUTTING, SEEDSMAN, 46, CHEAPSIDE, begs to acquaint his Friends and the Public of the arrival of his imported GERMAN TEN-WEEK STOCKS, in collections of 25 varieties for 12*s.* 6*d.*, or 50 varieties mixed at 1*s.* per packet. BROMPTON STOCKS, 12 varieties 9*s.*, or mixed 1*s.* per packet. New Purple and New Scarlet GIANT STOCK, 1*s.* GERMAN ASTERS, in collections of 20 varieties 7*s.* 6*d*, or mixed at 1*s.* Double red TURKEY ASTER, 1*s.* Double GERMAN WALLFLOWERS, 8 varieties 6*s.*, mixed 1*s.* ZINNIAS, 6*d.* and 1*s.* per packet; and among his general collection the following :—

Alstrœmerias
Auricula
Alonsoa grandiflora
Balsam, fine double
,, German varieties
Callichroa platyglossa
Calliopsis Drummondii
,, grandiflora
Calceolaria, fine, from 30 vars.
Centaurea americana
,, depressa
Celsia incarnata
Clintonia pulchella
Cobæa scandens
Dahlia scapigera, dwf., 6 to 9 in.
Didiscus cærulea
Dracocephalum argunense
Erysimum Perofskianum
Geranium, from finest sorts, 1*s.*
Heartsease do.
Humea elegans

Lupinus Hartwegii
Lychnis fulgens
Lisianthus Russellianus
Malva zebrina
Maurandya Barclayana
Nemophila phacelioides
Nemesia floribunda
Platystemon californica
Primula sinensis
Phlox Drummondii, fine dark colours
Pink, fine named sorts
Polyanthus, do.
Rhodanthe Manglesii
Salvia patens
Schizanthus retusus
Sutherlandia frutescens
Sphenogyne speciosa
Thunbergias
Tropæolum canariense
Tagetes lucida

Double Tuberoses 4*s.* per dozen. Ranunculuses, fine mixed, 10*s.* and 20*s.* per hundred; Black Turban do. 2*s.* 6*d.* per dozen; Golden Turban 3*s.* 6*d.* per dozen; Yellow Turban 6*s.* per hundred. Anemones, fine double, 20*s.* per lb.; Double Scarlet, 4*s.* per dozen; Single, 5*s.* per lb. Amaryllis formosissima, 6*s.* per dozen.

Grass Seed for lawns and pastures, with every description of Seeds for agricultural and culinary purposes: collections from 1*l.* to 5*l.* properly packed for all climates.

C. FARNES, 128, St. John-street, Smithfield, as the season for sowing Broccoli, &c., is now arrived, begs to call the attention of Amateurs and Gardeners to CHAPPELL'S SPLENDID CREAM BROCCOLI, for which an early application is requested, as the Stock is small. Also the undermentioned Seeds :—

Ady's fine large Cos Lettuce
Black-seeded Bath ditto
Chappell's early White Broccoli
Early White Cape ditto
Large Wakefield ditto
Fine Purple Cape ditto
Knight's Protecting ditto
Fine Early London Cauliflower
— Late ditto ditto

Fine dwf. White Solid Celery
,, Red ditto ditto
Early Hope Cabbage
,, Nonpareil ditto
,, Crompton ditto
Fine Large Imperial ditto
,, Drumhead Savoy
,, Blood-red Beet
Early Nonsuch Turnip

Also a fine collection of the newest and best varieties of Flower Seeds.

C. F. can confidently recommend the following Agricultural Seeds to the notice of Gentlemen and Farmers, being carefully selected from the best stocks :—

Skirving's Liverpool Swede Turnip
Golden Melon ditto
True Purple-top ditto
,, Yellow Tankard ditto
,, Hybrid Yellow Green top do
Large White Belgian Carrot
,, Selected Altringham ditto
True Cowlerass ditto
Italian Rye ditto
Peacey's ditto ditto

Large Drumhead Cabbage
,, ,, Red ditto
,, Turnip-rooted ditto
Long Red Mangel Wurzel
Yellow Globe ditto ditto
Red ditto ditto ditto
Bokhara Clover
New Lucerne
Mixed Meadow Grass Seed of the best description
Mixed Grass for Lawns

TO PINE-GROWERS.

TO BE SOLD by Private Contract, by order of the Assignees of James Bishopp, of Westburton, a Bankrupt, ONE THOUSAND SUCCESSION PINE PLANTS of all sizes, and One Thousand very fine Fruiting Pine Plants. N. B.—There will be about Four Thousand Pine Plants of all kinds, with the Pits, to be sold by auction in August next. Application to be made to Mr. Henry Satter, Auctioneer and Surveyor, Arundel; or to John Mann, the Gardener at Westburton, near Petworth, Sussex.

TO BE DISPOSED OF—A NURSERY, SEED, and FLORIST BUSINESS, situated at Henley-on-Thames, Oxon. For further Particulars apply to Messrs. W. & J. Noble, Seedsmen, 152, Fleet-street, London; or to the Proprietors on the Premises.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition at the Auction Mart, Bartholomew Lane, on Thursday, 7th April, 1842, at 12 o'clock, a splendid collection of Dahlias, in dry roots; also a fine assortment of Carnations, Picotees, Pinks, Heartseases, Fuchsias, Roses, &c. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

MESSRS. PROTHEROE & MORRIS will offer for Public Auction, on the premises, SION NURSERY, near CROYDON, about a mile from the Jolly Sailor Station of the Croydon Railway, on the 11th APRIL inst., the whole of the GREENHOUSE PLANTS, consisting of the finest varieties of Geraniums, Fuchsias, &c., in the healthiest and finest condition; also the Greenhouses, Utensils of Trade. &c.

Catalogues will shortly be announced.

N.B.—Messrs. Protheroe and Morris are authorised to treat for the Sale or Letting, by private contract, of the whole concern, including all the stock, on terms very advantageous to a purchaser or a tenant, on an early application being made to them at Leytonstone previously to the day of sale.

The houses are extremely well-contrived and stocked, and are in admirable order.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing: upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner, a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass supplied in any number or quantity, at wholesale prices.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l.* 5*s.* and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

The Fellows of the Society are reminded that Tuesday next, April the 5th, is the LAST DAY FOR PROCURING TICKETS AT THREE SHILLINGS AND SIXPENCE EACH.

The Gardeners' Chronicle.

SATURDAY, APRIL 2, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	Entomological	8 P.M.
Tuesday	Horticultural	3 P.M.
	Floricultural	7 P.M.
	Linnean	8 P.M.
Wednesday	Geological	8½ P.M.
Friday	Botanical	8 P.M.

It is the desire of every one who possesses a garden to have as much variety of colour and succession of gaiety throughout the season as the situation and means of the possessor can accomplish; yet in viewing most gardens, even where expense is not an object, borders devoted to the cultivation of particular plants may frequently be observed to be only attractive when such plants are in blossom, and looking bare, if not unsightly, after the blossom is over.

Supposing equal skill in the cultivation of plants in general to exist among gardeners, the great superiority in effect of one garden beyond another consists in the distribution and arrangement of the plants themselves, so that a succession of blossom, and a due contrast of colour, should, where practicable, keep every border furnished even to the end of autumn. In this respect most gardens are deficient. Succession is not attended to, except for the more limited space and favoured spots near the mansion, or in front of the conservatory. In most gardens it is considered sufficient to keep any border where plants have blossomed free from weeds and neatly raked. To the mind of the gardener this border tells its own history of the beauty of which he had boasted but a few weeks since; but the visitor or casual observer who walks through the garden, only seeking to please his eye with varied gaiety, makes no allowance for the past, which he has not seen, and remarks that though some parts are beautiful, a great portion of the ground has nothing worth looking at.

The value of American plants consists not only in the beauty of their flowers, but in the deep green foliage with which the borders are clothed during the greater part of the year; but with these plants after the bloom is over, the spikes of Yucca, Lilies, and Lobelia show themselves with great effect through the dark green mass of leaves, and the shade afforded by the leaves gives to the roots of Lobelia and Lilies that shelter from the scorching rays of the sun which in a dry season would otherwise, from exhausting the moisture at the roots, injure the beauty of the flowers. But borders of Roses, and many other flowering shrubs and plants, forming as they do such a prominent feature in the beauty of a garden until the month of June is past, afford, with all the neatness that can be bestowed upon the borders, no source of pleasure to the eye after the above period; and though no striking effect can be produced at a distance from these borders, similar to that which they exhibit at their proper season, yet by the following method the comparative gaiety of the scene may be kept up, and a relief to the eye, not without interest to the observer, preserved. Mix the seeds of the following annuals:—

Carnation Poppy
Papaver amœnum
Dwarf Dutch Poppy
French Poppy
Branching Larkspur
Dwarf Larkspur
Eschscholtzia californica
  Do. crocea
Campanula speculum
Candytuft, varieties
Nasturtium
Centaurea Cyanus, of various colours
Mignonette
Heartsease
Clarkia pulchella
  Do. white
Godetia of sorts
Antirrhinum majus
  Do. sparteum
  Do. versicolor
Collinsia bicolor
Coreopsis tinctoria
Convolvulus minor
Gilia tricolor and other species.

Then let this mixture of seed be very thinly scattered upon the borders early in the spring; it need not interfere with any ordinary work on the borders that may be required afterwards; and in places where the ground may be disturbed, many of the seeds will only appear at a subsequent period, and consequently flower later in the autumn.

Most of these annuals will continue flowering until the frost kills them, and if not removed too soon will leave behind them sufficient seed for years to come. Every gardener has remarked the strength, the beauty, and the effect of single plants of self-sown annuals that spring up occasionally in a flower-border, and have escaped that destruction which the merciless hoe in the hand of the undiscriminating labourer inevitably entails upon them; yet if the intelligent labourer is properly instructed, he will soon learn to confine his extermination to weeds, and his skilful eye will spare the annuals at proper intervals.

One case yet remains of much consequence to present, as well as to future effect, though generally but little attended to: this is the frequent examination of all annuals as they expand their first flowers, and the pulling them up unless in habit, form, and colour they are fit to remain for stock. Crowded as annuals generally are in the patches sown in gardens, their true character and beauty are seldom seen; and if among the mass sown some few blossoms appear more striking than the rest, and the seed of these is considered more worthy of preservation, it is generally too late to take away the worthless without destroying the plants most desired, and the seed so saved from the most select variety is but little better than that from the other plants.

The system now recommended gives the advantage of separation and a power of selection, with the certainty that a selected plant will, by its position as a single plant, not only blossom in beauty and vigour, but afford that abundant harvest of good seed which will amply repay in future years the trifling care thus proposed to be bestowed upon it.

The above remarks are equally applicable, on a smaller scale, to every garden, although in the present observations allusion has principally been made to large establishments.

With reference to Mr. Schattenmann's mode of preparing stable manure, a correspondent observes that "there is one point which appears opposed to the experience of farmers of his neighbourhood. The article states, that in two or three months, by hard treading and watering, he has a mass of manure thoroughly made soft and pasty. I have dung-heaps well trodden, and with all the wet of the last four and five months, and the lower part not nearly made. In fact, I find that when the upper part of a dung-heap is thoroughly made, the bottom requires to be lightened and again exposed, to reduce it to good manure. The article states that the water drained from the heap is saturated with sulphate of iron or sulphuric acid; but no directions are given as to the quantity of either to be applied, or to what extent the acid is to be diluted. In addition to the above substances, gypsum is understood to be a valuable mixture in dung-heaps; but here again the quantity and best mode of applying or mixing it into the heap is little, if at all, known; for example,—what quantity of gypsum is required to a cart-load of stable or yard dung?"

What Mr. Schattenmann's process may be beyond that which is explained at p. 191, we do not know. We find, however, that he insists upon the indispensable necessity of treading the litter well, as the heap is made in order, as he says, to check the violent fermentation and to enable it to retain moisture. It is to be remembered that a most important part of his plan is to drench his dung-heaps continually with water, which, however, immediately drains away, but is again returned to the heap. His stable manure is therefore always in a state of wetness, although not immersed in water. It is indispensable, in fact, that a complete drainage should be secured. With regard to the quantity of gypsum or green vitriol that is employed, it is impracticable to give any precise rule. The best guide is to add them to the dunghill *till it ceases to smell* of ammonia; this will be the sign that the ammonia is fixed. As the substances to be employed are very cheap, it is well to use enough of them. Probably salt-cake, an impure sulphate of soda, and extremely cheap, would answer the same purpose as gypsum or sulphate of iron. If sulphuric acid is employed, a very small quantity will be found sufficient, and it should be used in a very weak state; how weak is of no ultimate consequence.

We have great pleasure in announcing that a short course of Lectures on Chemistry applied to the art of cultivation will be commenced in April by Mr. Edward Solly, Jun., under the direction of the Council of the Horticultural Society. These lectures will be given gratuitously on Fridays, and will be open to Fellows of the Society and their friends exclusively. We shall announce the arrangements as soon as they are finally completed.

ON AMMONIA AS A MANURE.—No. II.

As scientific principles are merely deductions drawn from the attention and careful study of many facts strengthened by analogy and confirmed by experiment, it is evident that, in endeavouring to apply such principles to practical uses, it is always best to make ourselves as much as possible acquainted with all the facts and experiments bearing upon the matter; and in endeavouring to apply scientific principles to imitate natural conditions, it is far better to study facts with the aid of science than to depend on science alone. In the application therefore of ammonia, or any chemical manure, it is right first to examine the natural conditions and circumstances under which benefit has been derived from its application.

The ammonia supplied to plants by natural sources, whether from the soil or from the air, is given to them in very small quantity, but regularly, and dissolved in a large quantity of water; it is always combined with carbonic, or some other acid, and is never absorbed by the plant in a caustic state. These facts must not be lost sight of in attempts to supply plants with ammonia from artificial sources.

The chemical office performed by ammonia in the economy of vegetation is by no means yet clear; we know that many vegetable substances contain nitrogen, and that the substance best able to supply that element to them is ammonia; but the transformations which ammonia undergoes, the precise offices which it performs, and the changes which it effects in the vegetable matters of the plant, are but imperfectly understood; the experience of the agriculturist and likewise the results of chemical experiments show that most of the salts of ammonia possess similar powers; that is to say, that the various combinations which ammonia forms with acids are all great promoters of vegetation; but there is no evidence to show which of the salts produces the best effect.

Theory might lead us to suppose that the carbonate of ammonia, that salt which is generated during the decay of animal matters, would be the most powerful manure, whether we merely judged from the fact that it is thus formed in ordinary manure, or whether we reasoned further as to the food of plants, and the offices probably performed by ammonia. If, as some chemists have supposed, the chief value of ammonia consists in the nitrogen which it contains, and if the salts of ammonia are only valuable for the nitrogen which they contain, then it is plain that the acid with which the ammonia is combined, is of comparatively little importance, and the carbonate would be a salt more readily decomposed by the growing plants than the sulphate and those other salts in which the ammonia, in place of being united by a feeble affinity to a gas, is strongly combined to a powerful and not volatile acid. Attentive study of the action of manures, however, soon shows us that this supposition is incorrect, and convinces us that the sulphate and similar salts of ammonia are as valuable as the carbonate, and the salts in which it is held by a less powerful affinity. Ammonia has a very strong attraction for sulphuric acid; so much so, that salts containing this acid are decomposed by ammonia, which separates the acid from the substance with which it was previously combined, and forms sulphate of ammonia. When, therefore, manure is spread on the surface of land, although it is true that carbonate of ammonia is at first formed, yet if there are sulphates or salts of sulphuric acid present in the soil, they will be decomposed by the ammonia, and sulphate of ammonia will be formed; hence in such cases, the ammonia produced by the manures must be supplied by them in the state of sulphate of ammonia.

In the same way it is found that the strong affinity which ammonia has for acids causes it to combine with any of them which are united with substances for which they have a less powerful affinity than they have for ammonia. Sulphuric acid is, however, not only one of the strongest acids, but also that one which is most commonly met with in the soil. If then the sulphate be the salt of ammonia most commonly supplied by manures, it is plain that it is a valuable promoter of vegetation, and that in applying it to plants we shall be imitating the effects produced by the application of animal manures, in as far as they are due to the solution of ammonia; and sulphate of ammonia is a very convenient form of ammonia to use, inasmuch as it possesses no caustic properties, is not volatile, and may be obtained in the dry state, a fact which of course greatly diminishes the cost of carriage, and therefore the expense of its application. There are many processes whereby ammonia may be fixed or converted into dry solid salts, some in which acids are directly added to it, and others in which salts containing those acids are employed, and are decomposed by the strong affinity which the ammonia has for the acids they contain. There are advantages attending both these processes, so that their fitness depends on circumstances. When a strong acid, such as for example sulphuric acid, is added to a solution of ammonia or its carbonate, sulphate of ammonia is formed; in the former case the acid and ammonia combine directly, both being free,—in the latter case the carbonic acid has to be expelled, and accordingly when the sulphuric acid is added the weaker acid is given off, and the solution effervesces from its escape in the form of bubbles. When, however, a salt containing sulphuric acid is added to a solution of ammonia, more complicated effects are produced; thus, for example, when carbonate of ammonia and sulphate of lime are mixed together, a decomposition of both salts takes place, and sulphate of ammonia and carbonate of lime are formed.

When animal matters, or other substances containing nitrogen, undergo decay, they evolve, at a certain stage of decomposition, a pungent smell of ammonia; now, whenever such is the case we may be sure that ammonia is being formed, and is being lost or carried away in the air; this loss may be prevented by converting the ammonia, as fast as it is formed, into sulphate or any other fixed salt. When we pour sulphuric acid over such matters, or add it to a solution thus evolving ammonia, we effect this. The same end may be attained by mixing with them sulphate of lime or sulphate of iron, in which cases sulphate of ammonia and carbonate of lime, or carbonate of iron, are formed. The advantage of using sulphuric acid is, that it penetrates throughout the mass of decaying matters, and becomes soon thoroughly mixed with them; but it is perhaps objectionable on account of the expense and caution required in carrying it about. When we employ the sulphate of lime, or iron, this defect is remedied, but it requires more labour to mix them well with the decaying substances, in order to fix the ammonia completely.—*E.*

CONIFEROUS PLANTS.

The Pine and Fir tribe may be increased by cuttings, grafting, or layering; which are, however, only resorted to in the case of the rarer and more curious varieties of which seed cannot be procured. The propagation by cuttings is the next best method after that of seeds. About the month of September, or any time when the wood is three parts ripe, procure cuttings of the current year's growth with a small portion of the old wood attached, or what is termed a heel, selecting the small terminal short-jointed shoots, which are those most likely to form leaders; for although you may strike some of the more weakly side-shoots much easier and quicker, they are afterwards of little value, as they frequently are years before they form a good leader. Having procured the cuttings fresh from the tree, which is of great consequence,—for if they are allowed to remain any considerable time before they are put in after separation from the mother-plant, there is little hope of success,—prepare them by taking the bottom leaves partly off, which should either be done with a sharp knife or scissors. When the cuttings are thus made, procure some wide-mouthed or shallow pots, and well drain them, placing over the drainage a small portion of turfy peat or moss, and over that a layer of loam about one inch thick, filling up the remainder of the pot with white sand (the loam prevents the cuttings from cankering after they are rooted, which they are apt to do when placed in sand only); then plant the cuttings from ¼ to ¾ of an inch deep, according to their size; but the shallower they are placed the better, provided they are made secure and not allowed afterwards to get dry, and particularly if covered with a bell-glass at first; this is not absolutely necessary if the cutting-pots are put into a frame kept quite close, as an equal temperature, both for heat and moisture, is requisite at this time. Having placed the cuttings properly in the sand, give them a copious watering, and finally remove them to some cold frame, kept close and well shaded when necessary. They may remain in this situation till the end of October, when they should be removed to some cold pit for the winter, care being taken that they do not suffer from frost or damp; but they must on no account have much artificial heat. About the end of February remove the cutting-pots to a moderate hot-bed frame, and place bell-glasses over them (if not done before); the cuttings will then root readily, and many of them will be fit to pot off by the end of June, at which time those cuttings which are not rooted should be again placed in sand, and treated as before. When first potted off, the young plants should be treated like seedlings, and afterwards hardened to the open air.

The Pine or Fir tribe are sometimes increased by grafting or inarching; but it is at present little practised, and when it is so, only as a means of propagating some of the curious varieties of the proper section Pinus, which are the most difficult and uncertain to strike from cuttings. It is done in the following manner: procure some good healthy young plants of the common kinds of the same section to which the sort to be increased belongs in pots; if it is to the robust two-leaved section, such as the Pinaster or Stone Pine, procure them for the stocks; if to the Weymouth or Scotch, procure them; but if you cannot exactly procure plants belonging to the same section, they will take on the common Scotch Fir. If the species or variety belongs to the Spruce or Silver tribe, procure such for stocks; if it belongs to the Cedar or Larch section, the common Larch will do, bearing in mind that the species intended to be united should be as nearly related as possible; for although the true Pinus may be worked on a Larch stock, they will soon perish. The operation is performed on the current year's growth by what is termed cleft-grafting (and always on the leading shoot, shortening several of the side shoots at the time), or by splitting the stock down the centre, after the head is removed, sufficiently deep for receiving the scion, which must be cut wedge-shaped to fit. The time of performing the operation is when the young shoots are about half-grown, and are brittle, that is, breaking off short without tearing the bark, which in most cases is in July and August; and the time during which any given species or variety is in a fit state for grafting in this manner is not more than a fortnight, and the scion must be equally brittle with the stock: the operation is done in the usual way afterwards by tying and excluding the air.

Inarching is another way for increasing the Pine tribe, but, like grafting, only suitable for the propagation of curious varieties, and is certainly a more unsightly way than that of cleft-grafting, as the stock and scion hardly ever unite to cover the old heel when separated from the mother-plant. This operation may be performed either with the last year's or the preceding year's wood, but the former is by far the quickest in taking; it is best performed about the same time as grafting, but the inarches must not be removed for two years.

The next operation is that of layering, and certainly one of the best where it can be done, as it is the simplest and best suited for propagating the true section Pinus. Layering should be performed early in the spring before the plant begins to grow, and in the usual common way, by slightly tonguing and laying the shoots in light sandy soil, pegging them securely down. They will require two years to root, but it should be observed that in laying the whole plant must be layed, as it is very uncertain if only the bottom branches are, as these frequently die after the operation, if the upper ones are left on; therefore the whole plant should be bent down or the head cut off.

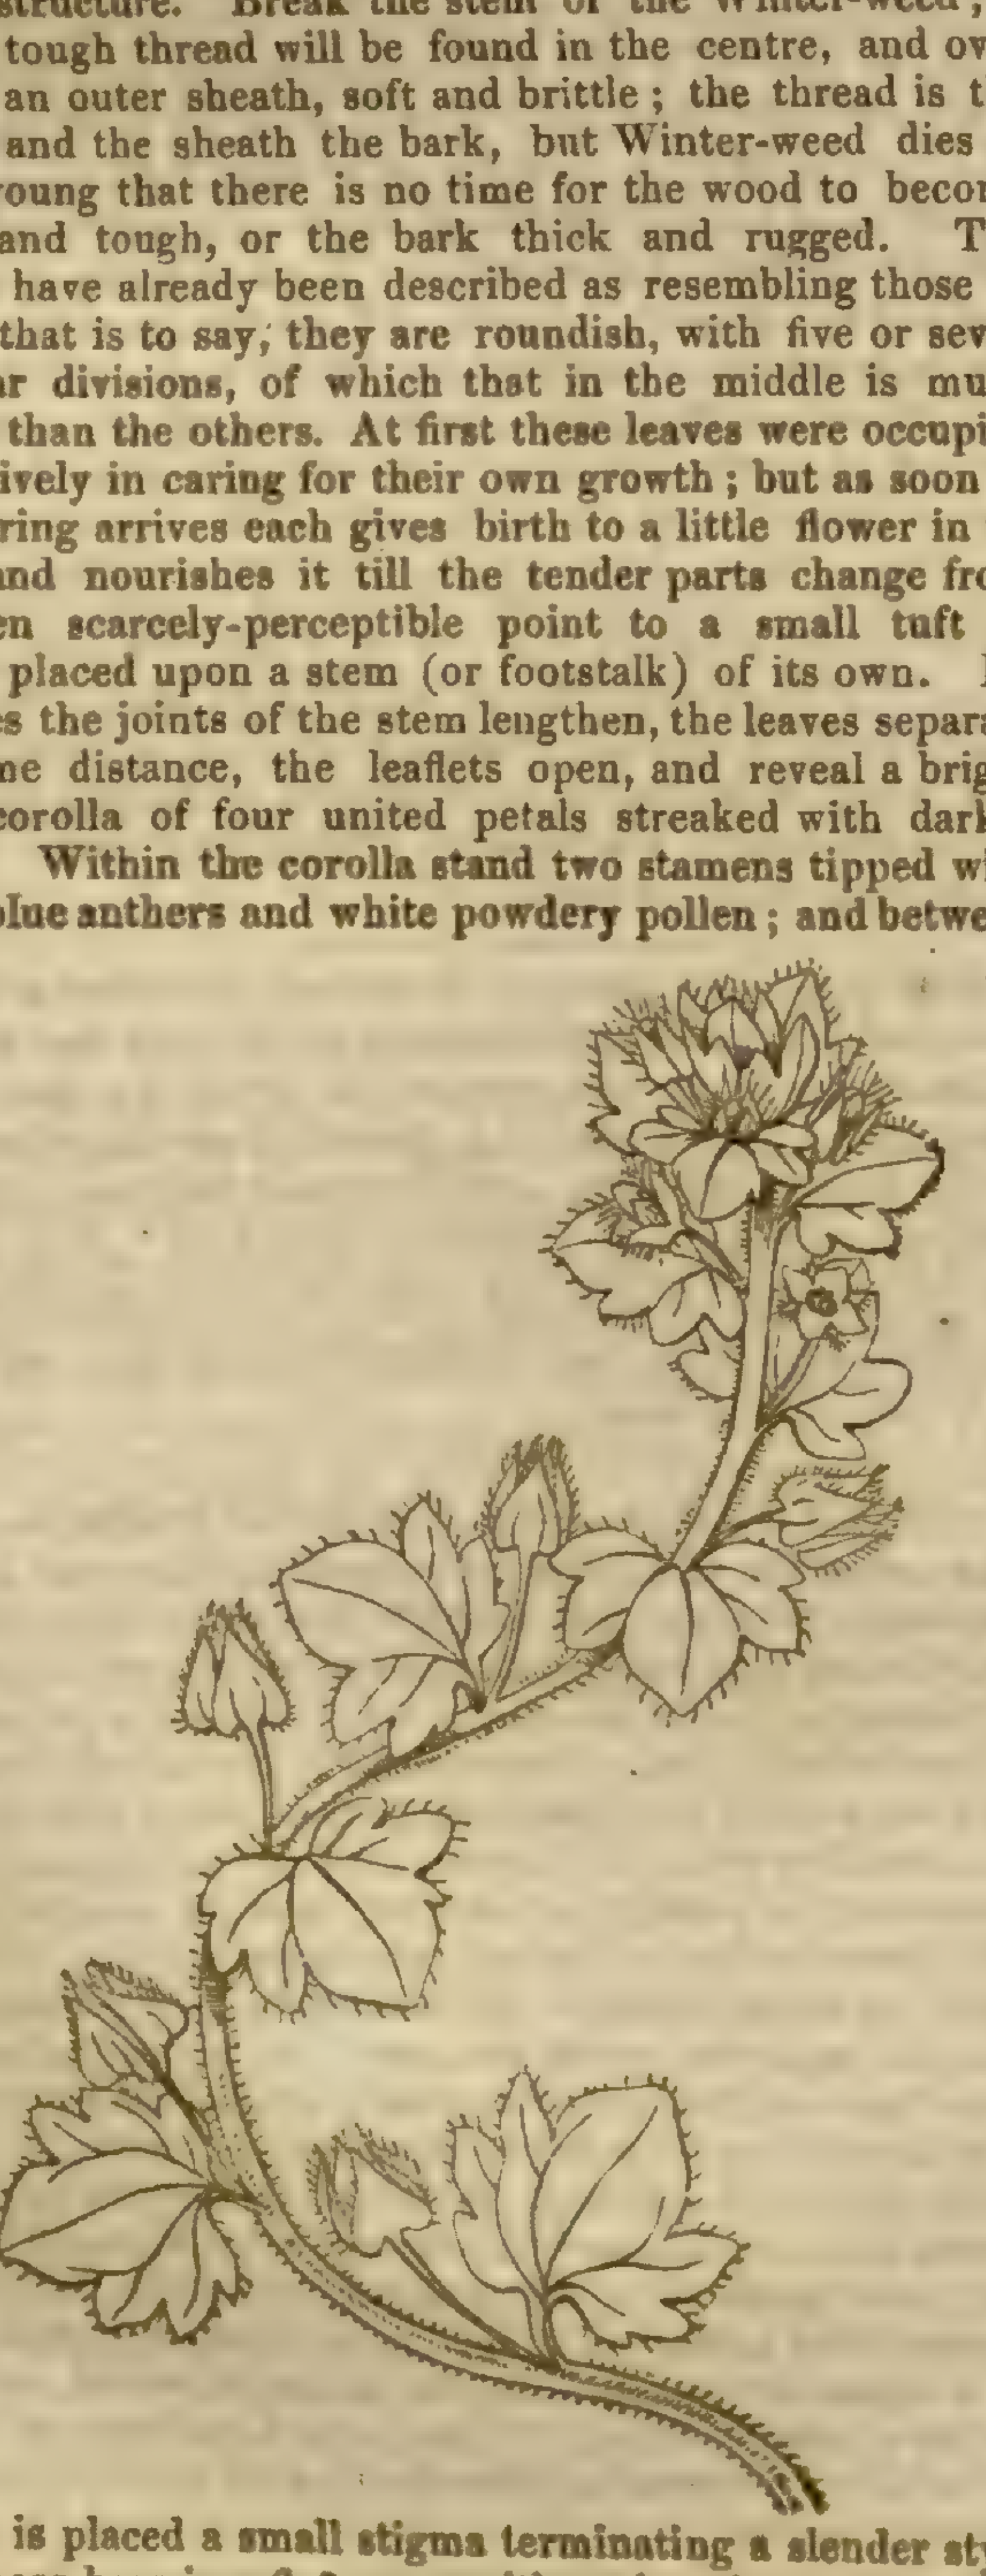
Pines and Firs should be planted in the open ground about the end of April, if they are rare or tender kinds; but if hardy and common ones, the end of February is best. The soil most suitable for them is a light sandy loam on a dry subsoil; but they will all grow in almost any soil that is not overcharged with water or too poor, if encouraged, at first, by mixing a little sandy loam and leaf-mould with the common earth, when planting them where they are permanently to remain. In planting, the roots should be spread out as much as possible, and kept near the surface, leaving the plant a little elevated on a small mound, if the adjoining ground is level, but if on a declivity it is of no consequence. When planted they should be well watered, not immediately at the roots, but for a yard or two all round, and then a few Spruce, Fir, or other branches should be stuck round to break off the sun's rays and the winds; if they are tender, they should have a large hand-glass over them for the first winter, which may remain permanently on during the months of December and January.

In preparing the compost for them, a little sand should be used if the soil of the place is tolerably good, but rather stiff; but if poor and light, a little loam and leaf-mould must be added; it is by far the best way to accustom the plants to the common soil at once, while they are young, for if the ground is made good for their reception only, they will grow vigorously and rapid, and as soon as they exhaust the prepared soil, they become stunted and frequently die prematurely.

In protecting the tenderer kinds, a single mat covering at a sufficient distance will keep most of them from injury, but much damage is done to the plants by not being able to remove the covering early in the spring. The covering should be constructed so as the top can be removed during the day-time, and replaced at night, which hardens the plants and at the same time protects them from the effects of the late spring frosts, which destroy the young shoots, especially of Webbiana and other Silver Firs. In pruning there is little to be done, except to cut away all dead branches and to protect the leader.—*G. Gordon.*

FAMILIAR BOTANY.—No. IV.

The Winter-weed.—What is that lowly plant which trails along the half-cleared ground of the kitchen-garden, resembling Ivy in its leaves, except that they are soft and perishable instead of hard and permanent? It commenced its short career in the autumn, when dews were heavy and the sun began to lose his power; it has struggled through the winter, nursing its tiny flowers in the very bosom of its leaves, so that no danger could approach them; and now it is lengthening its stems and unfolding its blossoms beneath the transient gleams of a vernal sun, the humble companion of the Primrose, the Cowslip, and the Violet—the second harbingers of spring. By May it will have disappeared, having first scattered over the earth a plentiful supply of seeds to feed the sparrows and to multiply its race. Because of its wintry habits, it is often called the Winter-weed; others name it the Ivy-leaved Speedwell, and botanists term it Verónica hederifólia. It is mean in its outward form, but to the botanist it is beautiful when curiously examined. Observe its thread-like stems; one would scarcely suspect them to be formed on the plan of the Oak and the Fir tree; and yet when these trees are very young there is but little difference in their structure. Break the stem of the Winter-weed; a small tough thread will be found in the centre, and over it lies an outer sheath, soft and brittle; the thread is the wood and the sheath the bark, but Winter-weed dies so very young that there is no time for the wood to become hard and tough, or the bark thick and rugged. The leaves have already been described as resembling those of Ivy; that is to say, they are roundish, with five or seven angular divisions, of which that in the middle is much larger than the others. At first these leaves were occupied exclusively in caring for their own growth; but as soon as the spring arrives each gives birth to a little flower in its axil, and nourishes it till the tender parts change from a green scarcely-perceptible point to a small tuft of leaves placed upon a stem (or footstalk) of its own. By degrees the joints of the stem lengthen, the leaves separate to some distance, the leaflets open, and reveal a bright blue corolla of four united petals streaked with darker veins. Within the corolla stand two stamens tipped with their blue anthers and white powdery pollen; and between them is placed a small stigma terminating a slender style, at whose base is a flat ovary with an interior too small to be easily examined, but in reality containing a pair of pockets, each of which is filled with young green seeds. It is in the early morning that these minute blue flowers for the first time expand; as the day advances they spread themselves flat to catch all the influence of the sun, but at night "they fold their thin leaves and shut their floret eyes," never again to open them; for the life of the blossom of the Winter-weed ends with the first day that shines upon it. But the blossom is only the beginning of the perfect existence of this tiny flower. As soon as it has fallen, the thin flat ovary grows larger, the floral leaflets or sepals already spoken of expand to cover it as it swells, and in a few days the seed-vessel is perfect, with its seeds and all their manifold contents.



Here it is that the ring of Nature's power is closed, to be recreated in a few short months, when the seeds thus speedily and silently prepared shall have reached their allotted time to sprout into new-born plants: and this, which is the life of the Speedwell, is also that of every other weed. The curious phenomena of growth, and reproduction and decease, are infinitely varied indeed, but are wonderfully alike in their variety, and all point to the existence of a simple code of mysterious laws to which the countless forms of vegetation are irresistibly subjected.

Of the Speedwells there are many, some trailing like the Winter-weed, others erect and loaded with long spikes of blue or white flowers; the latter are summer species, the former are all wintry and vernal. The most common is the Field Speedwell (Veronica agrestis), which chiefly differs from that before us in having leaves roundish ovate, with three or four equal teeth on each side, and the leaflets of the calyx oval, instead of heart-shaped.—*R. E.*

IS THEORY WHAT IT IS OFTEN REPRESENTED TO BE, OR WHAT IS IT?

A FEW weeks ago a correspondent, in p. 779 (1841), made some excellent observations upon the folly of setting theoretical knowledge in opposition to practical. I confess I have often been amazed with the manner in which theory, as applied to horticulture, is often looked upon by a great number of professional gardeners. Such a man, says one, is no gardener; he is a mere theorist. Another shakes his head very wisely, and tells you he does not like theoretical gardeners; and a third, to whom you have been talking about something which has not succeeded according to your wishes, gravely informs you that there is too much theory about it. If a man professes to be a theorist, no matter whether he is or not—let him be the greatest dunce in the profession, if you will—still all his failures are laid at the door of theory.

Now, as I always like to put the saddle on the right horse, I shall endeavour to prove that this same theory is anything but well used. But perhaps some of our "practical men" may stop me before going any farther with the convenient, and, doubtless, in some instances powerful argument, namely, "that there must be something in it—so many people cry out against it, they cannot all be wrong." I grant there is something in it; but it is the want of theory which occasions all the mischief—or rather, the possession of a false theory, which every one knows is worse than none at all.

I have been told by more than one "theoretical" gardener, when advocating the practice of some of our best practical gardeners with reference to the winter temperature of greenhouses and conservatories—that is, giving no more artificial heat than merely to dry off the damp or keep out the frost—"Oh, my good friend, you do wrong; greenhouse plants, natives of the Cape of Good Hope, New Holland, or Van Diemen's Land, are never subjected to so low a temperature as that; take my advice, which is only a lesson from nature, and, in fact, the theory of the thing. Keep your house as near as possible to the mean range of the thermometer, say at the Cape, which, according to Dr. Lindley's 'Theory of Horticulture,' is in winter from 48 to 93 degrees." Now, this is what my friends call theory! They might just as well have told me to plant potatoes in a dark cellar—to keep the temperature from 40 to 90 degrees; that this would be quite enough of heat for them, and that I should have a most abundant crop! Their theory was evidently all on one side. I agree with them that Nature is in all cases a sure guide and a most excellent teacher; but we must examine her laws generally, and not singly, before we profess to understand or act upon them. The growth of plants does not depend upon one circumstance only; heat is one requisite, but light also is another; and if you raise the temperature of your greenhouses during the winter months to the mean of the Cape or New Holland, you are acting in direct opposition to Nature's laws, and, of course, cannot expect to be successful. But is theory to blame for this? Certainly not,

Or, to take the theory of pruning or heading-down for an example. One of our theoretical gentlemen may inform us that a certain number of roots supply nourishment to a given quantity of branches, and if we take away one half of the branches, the other half which remain will grow with double vigour; and further, if we head-down a straggling-growing plant to one-third of its original height, what remains will grow with great vigour, and form a fine dwarf specimen. But is it not notorious to every gardener of much practical knowledge that this will only hold good in certain cases, and that if indiscriminately applied to all plants, those who do so will find when too late that there has been, sure enough, too much "theory" about the operation?

I was once induced to apply this so-called theory to some plants of Euphorbia jacquiniflora, when they were in a resting state, the result of which was, instead of the plants growing strongly, they never grew again. I am certain that every one who has had much experience in pruning and heading-down plants will readily call to mind instances in which they have been unsuccessful; and this in a number of cases will have been owing to the operation having been performed at an improper season, or to the plants being in bad health at the time.

The proper time for pruning such plants as the Willow or Currant may be in autumn, mid-winter, or spring; and it may matter little at which of these periods the operation is performed. Not so, however, with all plants. So that here again, as in the other case, the theory of pruning depends upon a variety of circumstances; and if one of these only be taken and wrought upon, while the others are disregarded, the results will certainly be unsatisfactory. But theory has not been the guide, and if we have taken the wrong road theory is not to blame.

I might thus go on and point out various other examples which have come under my own observation, but I think I have stated enough to prove that all are not theorists who profess to be so, and that it is scarcely fair to make theory the scapegoat for bad practical gardeners.—*a, e, i.*

AMATEUR'S GARDEN.—No. XIV.

Those who are anxious to have a fine display of flowers during autumn and winter, should now make a selection of the best kinds of Chrysanthemums and commence their propagation. The most simple method of getting good strong plants is by taking off the young shoots with roots and planting them singly in small pots (60's), taking care to surround the base of each with a little sand; if the young shoots have no roots, they will soon form them in these circumstances. The pots should then be put into a close frame and kept shaded during sunshine until they have formed roots for their support. After being struck, they can be grown out of doors all the summer, and only brought into the house when the flowers begin to expand in autumn. A Vinery or Peach-house, after the fruit is gathered and the leaves off, might be filled with these plants, and thus they might be flowered in perfection without any extra expense. There is nothing so easily grown which is so well fitted to ornament the greenhouse and sitting-room in winter, for, having stems which die off every season, they can be subjected to any kind of treatment without sustaining permanent injury. Three or four years ago some very fine sorts were sent over from Jersey, many of them having the flowers finely incurved, but almost all light-coloured; mixtures of white, rose, and lilac. The prettiest of these are named Formosum, Lacidum, Vesta, Eclipse, Defiance, Queen, Beauty, and Goliath: the last-named produces very large flowers. Subsequently, Mr. Salter sent from France some fine dark varieties, which flowered in several collections last autumn, and formed a fine contrast with the lighter kinds. The best of these are Duc de Canegliano, fiery dark red, sometimes tipped with yellow; Campestroni, dark crimson; Maria, bright red; Reine Murat, red orange; Thérèse, bright red; Grand Napoleon, dark velvety; Arago, buff and red; Gouvion St. Cyr, dark orange; Fléchier, crimson; Minerva, cream and rose; Princess Maria, large rosy lilac; and Col. Combes, rosy salmon. Some of the older kinds, such as Golden Lotus-flowered, and Wheeler's changeable yellow, should have a place in all collections; and as the latter is one of the earliest flowerers, it does very well for planting out of doors.

Annuals, which were sown in pots some time since for early flowers, will probably be ready for transplanting in the beds or borders; sow others in the open ground to succeed them. Transplant seedling Heartsease, stir up the soil of the beds where others have been all the winter; this will also be beneficial to all beds which contain Tulips and other florists' flowers. Auriculas which are coming into bloom should be slightly shaded, to preserve the colour of the flowers.

If the edgings of the walks have not been put in order, it must be done now without delay. Various plants have been recommended in this Paper lately as suited for this purpose, and the most of them would be probably pretty in certain situations. Box and Thrift, however, are the standard plants for edgings, as they will grow well in all gardens. Besides these, there are Gentian, Daisies, Polyanthus, London Pride, and many others which can be used. With grass edgings the walk or beds will always be made to look best if the edge is not deep; nothing looks worse than deep cuttings at the sides of walks.—*R. F*

HOME CORRESPONDENCE.

Ammoniacal Manure.—Seeing in p. 203 a communication respecting the compounds of Ammonia, I beg to offer you an account of some experiments which were tried with great care, under my immediate superintendence. A piece of land, consisting of heavy loam, was sown with Tares, which were mown and carried away as green food for horses during the months of June and July; the field was then ploughed and well dunged, excepting a portion left without manure for the following experiments:—On the 30th of July young Cabbage-plants, such as are commonly used for cattle, were planted on ridges, each Cabbage occupying a square yard. It was found by experiment that it required 5½lbs. of sulphuric acid, containing 65 per cent. of dry acid, to neutralise 87½lbs. of ammoniacal liquor from the gas-works; this was taken as a standard, and quantities of nitric, muriatic, and phosphoric acid were added to other proportions of ammoniacal liquor, so that each contained equal quantities of ammonia; the carbonate of ammonia was the solid carbonate of commerce dissolved in water, and was used in quantities to contain an equal proportion of ammonia with the others; the solutions were then largely diluted with water, and to each plant was given every other day, for two months, half-a-pint of the solutions. Each plant in the rows 1, 2, 3, 4, and 5, received in addition to the gas-liquor 300 grains of a mixture of phosphate and sulphate of lime; each plant, therefore, in the first 10 rows received in the course of two months about half-an-ounce of nitrogen; those in the first five rows receiving, in addition to this, 300 grains of a mixture of sulphate and phosphate of lime. These experiments cannot be considered of any value with regard to the weight which a given quantity of a salt of ammonia is capable of producing in a plant, but can only be useful by comparing the effect of the different acids. The late period when these plants were put into the soil will account for the very small weight which the dunged Cabbages produced. The usual time for planting Cabbages is in June, and even then a few days' difference in the planting produces a very perceptible difference in bulk at the end of the season. The Cabbages were weighed on the 31st of December.

—*J. R. L.*

Potatoes.—I was pleased to see Potato-planting discussed in your columns, and hoped it would have produced information upon one point of great importance to cultivators, namely, what is the largest acreable produce that has been raised? and whether it is possible, by any improved mode of culture, to increase it still further? Scarcely any crop is liable to such variations in the product. Some growers have been content with from five to eight tons per acre, whilst Mr. Knight's crop of Ash-leaved Kidneys, mentioned in your No. 10, p. 155, amounts to 24 tons, 6¾ cwts.; this is an immense difference. In your extract from Mr. Knight's paper to the Horticultural Society, you have omitted one very material item—the quantity of seed he used. In that paper he states, that he planted the Kidney in rows two feet distant, with whole Potatoes, touching each other in the rows; thus planting a crop instead of seed; for, if we suppose each set to weigh only four ounces, and planted three inches from centre to centre, the quantity of seed planted would weigh 9 tons, 14 cwts., 1 qr., 23lbs.! leaving only 14 tons, 12 cwts., 1 qr., 24 lbs., as net return. Now, I have known a single half-acre, accurately measured, produce 8 tons, 16 cwts. (not a few yards of a favourite row, as in Mr. K.'s experiment); and this was produced from certainly not more than 15 or 16 cwts. of seed; but of this no accurate report was made to me. I, myself, have planted scores of acres with no more than from 9½ to 10 cwts. per acre, and never saw reason to increase the quantity. I always cut my sets from the finest Potatoes, two eyes in each set. My crops were very large and the sample very equal, with an unusually small proportion of small Potatoes. I am disposed to differ from you in opinion as to the distance at which the rows should be placed apart. I have more than once planted the sets four feet asunder every way, and have found the crop very good, 16 or 17 tons per acre (I am sorry I have lost the record of these experiments, which were made 30 years ago). In 1838, a single Potato of the kind called "Forty-fold" was divided into four sets, and I planted them in my garden a yard apart, on the 17th April; they were dug up the 6th Sept., and produced ninety-five Potatoes, large and small, weighing 31 lbs. Allowing, therefore, a square yard to each set, which I think was about what would have been the case had the experiment been on a large scale, here is an acreable produce of nearly 17 tons from about half a ton of seed. Economy of seed is frequently of the first importance, and if used in the same wasteful way as recorded in Mr. Knight's paper, the seed would sometimes much exceed the value of the crop. In 1800, for instance, Potatoes were sold in the neighbourhood of Bristol currently for 25*s.* per sack of 240 lbs. In 1801, they were worth no more than 1*s.* 6*d.* per sack, and were with difficulty disposed of even at that price. In these (the former?) years the seed, as in Mr. Knight's experiment, would have exceeded the value of the crop by 95*l.* per acre. If any of your readers will give information of well-authenticated unusually great produce, with the mode of culture, it will, I think, be a very desirable acquisition to the general stock of knowledge on the subject. I should be glad also if Mr. Jennings, who gives his method of planting Potatoes, No. 7, page 110, would explain what advantage can arise from planting them in November to get a crop the September following, a period of 10 months, when 6 months are well known to be long enough for such a crop to be on the land—not to mention the risk from the seed lying in a dormant state during winter, exposed to the vicissitudes of the season.—*Lusor.* [We apprehend that Mr. Knight did not intend to say that the *tubers* of his Ash-leaved Kidneys, when planted, touched each other, but that the stems would do so when full-grown. We can state, of our own knowledge, that Mr. K.'s invariable practice in giving the result of his experiments was to avoid any instance of excessive growth, or, as our correspondent calls it, a favourite row, and to select an average part of the ground under experiments. It is quite possible that a yard apart each way may be a proper distance for some very coarse varieties; and in the Hort. Trans. vol. I., N. S., p. 155, will be found a report upon a Potato, called La Divergente, which in 4 square feet produced 17 lbs. 14 oz. from one set, or at the rate of 21 tons, 13 cwt., 59 lbs. per acre; but this sort had stems fully four feet long. In the same experiments, although such sorts as the Early Kidney, whose stems are about two feet long, had four square feet to grow in, they only produced at the rate of 3 tons, 19 cwt. per acre, net; although when in rows two feet apart and six inches in the rows, those same kinds yielded at the rate of 7 tons, 18 cwt. per acre, net. The greatest crop ever obtained by Mr. Knight is stated (Hort. Trans., vol. I., N. S., p. 417) to have been 34 tons, 8 cwts. 107 lbs. from an early variety, planted nine inches deep, and manured with decayed Oak leaves.]

New Potatoes.—When I lived near Bristol, I one year made the following trial:—Having the bottom of an old faggot stack, I took it into my cellar, and spread a layer of it about 6in. thick; I planted Potatoes upon this, and then put an alternate layer of the faggot pile and Potatoes until the place was filled to the top. The Potatoes put forth shoots and tubers, but formed no leaves, and I supplied my table for some time from this heap with good dry new Potatoes.—*J. Wedgwood.*

Chapman's Potato.—We have received an answer from Mr. Chapman to the questions put by Mr. Gordon (p. 188), the substance of which is this:—1. Mr. C. denies *his* having had anything to do with the sale of the Passe Colmar, under the name of Chapman's Pear, as Mr. Gordon alleges; and he complains bitterly of this statement as slanderous and unjust.—2. He says the questions that have been put to him are most "impertinent and unfair."—3. He denies that his Potatoes are produced by retarding the sets, and planting them much later than ordinary.—4. He says that the difference between his Potatoes and those grown by others for the London market, is that they are much better.—5. That he has had his variety these seven years, but does not mention how or where he obtained it.—6. That he has no particular mode of greening, and has tried "no silly experiments;" and finally, that his Potatoes require no other treatment than to be exposed to the air as soon as they are secure from frost, and to be kept so till planting-time. This is as far as we can make out the substance of Mr. Chapman's communication, and with it we close the question. We trust our readers will find it more satisfactory than we do; they now can judge for themselves, from such evidence as has been produced, whether the Potatoes which have led to the discussion are a new and peculiar sort, or only some well-known kind treated in a peculiar way. This will be best ascertained by purchasing sets, and growing them. At present we have nothing but assertion against assertion, and under such circumstances we should not be justified in offering any opinion of our own. We can only repeat that be they what they may, they are of excellent quality.

Laws of Gardening.—A man takes a house and garden on a lease, without any particular stipulations; in the garden he plants a variegated Holly, which, as he quits the house and garden at the expiration of the term of his lease, he wishes to remove: has he a legal right to do so? —*Birdlime.*

The Bullfinch.—There is no one less likely than myself to be an accuser in the matter of birds. I have time out of mind been willing to divide the produce of my Strawberry-beds with the blackbirds and thrushes, the sparrows were welcome to what they could get, and I am not even very angry with the mice, who carry off half a row of newly-sown Peas. As regards the chaffinches, they are, *non obstante* any harm they do, especial favourites; but there must be a limit to this licence and indulgence. Though I have been all along willing to accept payment in song, in beautiful plumage, &c., I must give up to general and public reprobation the bullfinch. I had often heard of its depredations amongst the buds of fruit-trees, but it was not till this morning that I had an opportunity of seeing two pair at work. I was well placed at a small window near two Greengage Plum-trees. In ten minutes the ground under them was covered with bloom-buds, which had been snipped off with their sharp bills; why or wherefore I could not discover, for they did not appear to eat any part. Mr. Waterton himself would have been out of patience and have denounced their depredations as I now do, recommending even the most tolerant and tender-hearted, and those most sceptical as to the mischief done by birds, to take effectual means of ridding themselves of this orchard pest.—*Totty.*

Gas-water.—I was not disposed to do anything with ammoniacal gas-water, until your leader about three weeks ago, where quantities are stated and the experiment proved. I found, however, that though diluted 1 in 7, it was not stated what quantity was to be used per rod. Some one inquired, however, before me, and the answer was 1 gall. per rod. I tried it—1 gall. per rod, diluted 1 in 6; but I neither killed worms nor moss, nor scorched the grass, though the gas-water was reputed to be strong. I have since used it diluted, 1 of gas, 2 of water, and poured freely over the grass, so that I have no doubt as much as 3 galls. per rod was used. This destroyed the worms that were near the surface; they came out and died. It also effectually destroyed the moss, and I do not think has killed the grass, although my lawn at the present moment looks browner and worse than I ever saw it in the hottest summer. I do not trouble you with all my experiments on the grass, and on worms, slugs, and snails, on all of which I tried it at different strengths, previously to deciding on using it—one-third gas and two-thirds water. Another thing that renders it very difficult to give directions about, is the great difference in the strength of the gas-water. I had six or eight water-barrels full; the first two were said to be very strong, the next two stronger, and the last two strongest. This sadly puzzles experimenters: and there is no instrument to ascertain the strength, though if it is to be extensively used there is no difficulty in finding one, a saccharometer would do.—*N. D.*—[The difference in the strength of gas-water is so great that we fear no good general directions can be given for the quantity of it to be employed. It varies also in the degree of causticity, and it is only when in the most caustic state that it will destroy worms.]

Guano.—So much having been said lately about guano, it may perhaps be interesting to some of the readers of the *Chronicle* to learn how it is used in the neighbourhood of Arequipa, in Upper Peru, in the cultivation of Indian Corn and Potatoes. The time for applying it to Indian Corn is when the stems are about 2 feet high; a small quantity is then dusted on the ground round the plant, and the earth is immediately thrown up round the bunch of stalks, with the double object of covering the guano and supporting the plant: a single handful is sufficient for three bunches of stalks. To Potatoes it is applied after the plant is a few inches high, in about the same proportion as to the Indian Corn; but instead of being dusted on the ground, it is placed over the roots (not immediately upon them), the earth being partially removed and replaced. In both cases the land is irrigated within two or three days, as the roots, if not destroyed, are much injured, by dry guano. —*W. D.*

Education of Gardeners.—Gardeners, we think, might derive great advantage by studying those parts of geography which treat of physical climate and the distribution of organic bodies over the surface of the earth. To be acquainted with the circumstances that determine physical climate might be turned to some useful purpose by those whose occupation it is to cultivate vegetables in a limited piece of ground. It is well known that the native places of many of the vegetables that are grown in our gardens are far apart, both in regard to latitude and altitude. Climate appears to have a wonderful effect in modifying animals and plants; and to know the extent of modification which plants will endure under various circumstances ought to be part of a gardener's education. Nature, to a certain extent, has already pointed it out. It is said that the country of the Vine and the Mulberry is between the 30th and the 50th parallels of latitude; and that Wheat will grow as far north as the 60th degree. We are also informed that under the equator Wheat will seldom form an ear below the elevation of 4,500 feet, or ripen above that of 10,800 feet. In a range of 6,000 feet there must be a great difference of temperature, of moisture, and of soil; but yet to all these variations Wheat has the power of accommodating itself. But we need not go so far as the equator for examples, for any one that has studied botany upon the mountains of Britain must have observed a striking difference between plants of the same species growing in different elevations. Keeping these facts in view, gardeners might do much in rendering tender plants more hardy, and prevent the frost from destroying many of their winter crops. I find that Cabbage plants may be made to endure frost that would destroy them in the ordinary way of culture. Evergreens, such as Laurels, taken from a rich soil and sheltered situation, would very likely suffer much injury by being transplanted in a poor soil and bleak aspect, but such a change is necessary, in order to fit them for their new settlement: instead of long succulent shoots, they will put forth short woody ones. In a few years the appearance of the plant is altered; in place of long branches and broad leaves we have a thick-set plant, with a dense mass of foliage, defying the surly blasts of winter to injure them. Gardeners will sometimes travel many miles to see what they call a first-rate place, expecting to observe something new in the way of their profession; but we believe a walk to the top of such places as Ben-Nevis, Snowdon, and Helvellin, would be profitable exercise both for body and mind. It is a pity that the study of nature should be so much neglected in almost every branch of education; for many may bawl out, like Erasmus, and cry,—"Decem annos consumpsi in legendo Cicerone," until the echo reply in Greek Ονε (Ass).—*Peter Mackenzie, West Plean.*

West Indian Gardening.—In a Paper so extensively circulated both at home and abroad, it may, perhaps, be interesting to some of your readers to know that Potatoes have been successfully cultivated at St. Ann's, Jamaica, within a mile of the sea-side, about 200 feet above the level of the sea. I found the late red variety to succeed better than any other. If not planted during the rainy season, they require copious watering, while the germ is assimilating the vegetable albumen, &c., stored up in the tuber. After the fibrous roots are well established, no further care is requisite. The rows require to be at least three feet apart; the tubers intended for seed should be taken up as soon as the leaves assume a yellowish tint; and a considerable period should elapse previously to their being planted. Dahlias flower well; but if the roots are not taken up and a season of rest induced by their being kept quite dry, they soon become debilitated from the effects of premature excitement. A few varieties of the English Rose also flowered beautifully; and I am confident that many other deciduous plants from temperate climates might be cultivated in wooden boxes, if removed into the shade and kept perfectly dry during their usual period of rest. I do not ascribe the general failure in their cultivation in the West Indies to the increased perspiration that we might readily suppose to be induced by the brilliant rays of a tropical sun. This is to a certain extent counteracted by the immense quantity of aqueous vapour held in suspension by the atmosphere, and the complete resuscitation derived from the drenching dews consequent upon an unclouded sky. De Candolle doubted the capability of leaves absorbing moisture; but how can dew and slight rain that do not penetrate to the root exhibit so striking an effect on plants otherwise than by absorption? The experiments of Hales favour the opinion that all leaves inhale moisture by the under surface, and that many absorb equally by both. I may state, however, that I was quite baffled in attempting to flower the Snowdrop; which may be accounted for by the impatient anxiety of the cultivator, with whom that interesting flower was always a favourite. Under these circumstances, we are too apt to overstep the bounds of prudence. At first I experienced much difficulty in obtaining a healthy "braird" in sowing annuals and other garden seeds; subsequently, I found the better way was to damp the small seeds and steep the larger until the embryo had burst its integument; then sow, cover lightly, and shade until the seminal leaves were fully developed. This is the more necessary on account of the numerous ants which in the West Indies are very destructive to newly-sown seeds. If the seeds, while being damped, were sprinkled with lime, it would be beneficial, provided care is taken not to allow the seeds to become dry. Lettuces grow well, and produce perfect seed. Peas, if copiously watered when in bloom, produce a good crop; Beans do not. Carrot, Turnip, and Radish grow well during the hurricane months. But by far the most useful vegetable is the Turnip-rooted Cabbage; the few leaves situated on the crown are not easily stimulated to excessive evaporation, and hence its superiority to any other variety. Shallots and the Potato Onion grow well in light marl; Onion-seed is with difficulty brought to germinate. Regarding the best method of packing seeds to be sent abroad, much has been written. To prevent their becoming damp is the chief requisite. No doubt a packet of seeds might be kept a little cooler by being enclosed in a thick wooden case, partly filled with sawdust, wool, or any non-conducting substance; but the trifling difference of temperature thus gained would avail nothing if the seeds became damp. The access of moisture and oxygen causes germination, which being effected even in a very slight degree, and not sustained, inevitably ends in death. Let those, however, who are interested in the matter submit a few seeds to a higher temperature than is likely to be experienced in crossing the equinox, and they will certainly find it sustained without impairing their vitality. Too much is often laid to the account of bad packing and "crossing the line;" but if seeds were judiciously sown, there would be more prizes and fewer blanks in the present lottery of sowing tropical seeds. It would be difficult to convince me that a bottom heat of 55 deg., and an atmospheric temperature of 65 deg., are likely to be successful; or that a pot containing seeds will do without the trouble of draining, merely because if they grow, the seedlings will soon require to be repotted. This is a very lame excuse, and betrays either ignorance or indolence. If done at all, why not properly? since seeds and cuttings require more perfect drainage than plants. It ought likewise to be known that the warmth of the earth is often in the West Indies 10 degrees higher than that of the atmosphere.—*Thos. Cowan.*

Salt Cake; impure Sulphate of Soda.—I was induced to try some common salt cake as a manure, and directed my broker to buy me 5 cwt., and my bailiff to sow it as a trial against some nitrate of soda. On receiving it, I found it consisted of large pieces, very hard; and my only means of using it was to place it in a butt, pump the drainage of my farm-yard upon it, and allow it to remain till dissolved. The cost is very low, but the means of applying it does not admit of my judging of its effects. I offer this, as others equally ignorant with myself may procure it without the convenience of applying it.—*R. G.*

Celery.—I perceive in your two last Numbers some difference of opinion has been expressed respecting the length of time required to blanch Red Celery. My experience confirms Mr. Paxton's as to time; and I think it ought to convince your Sheffield reader, for I obtained the first prize for Celery at the exhibition held in the Sheffield Horticultural Gardens last September, with Celery which had not been finally earthed more than three weeks before the show, and had only had one slight earthing previous to the final one. I may also add, it was grown in double rows as recommended by Mr. Paxton, and the heads when prepared for exhibition averaged from nine to twelve pounds weight.—*John Stewart, Gardener to Lord Denman, Middleton-hall.*

Pine-growing.—Mr. Y.'s visit to the Fence, Macclesfield, gives Mr. Brocklehurst's gardener a lift above his brethren in the profession by his way of growing Pines. I am rather an old Pine-grower myself, and generally contrive to get as many plants in the fruiting-house as it will hold; but when I came to hear that above one hundred fine Pines were cut in one year out of one house, the tan-pit of which measures 17 feet by 10, I was astonished. I do not know what "Y." calls fine Pines, but it is well known amongst gardeners that good fruiting plants require a distance of at least 2 feet between them; and that one dozen large Providences, such as I have seen Baldwin's houses full of, weighing from 8 to 12 lbs. each, would fill such a house; and how it can be possible that one hundred should be squeezed into so small a space, I dare say surprised many gardeners as well as myself. But as gentlemen who grow Pines may expect a similar increase in the number of their fruit in proportion to the size of their houses, I think the passage on Pine-growing noticed by "Y." should, in justice to Pine-growers, be further explained. Pines fruit but once, and when a house is set for fruiting, which is generally in the autumn, the plants occupy the house the greatest part of the succeeding summer.—*Ananassa.*

Preserving Fuchsias.—Having seen that some of the correspondents of the *Gardeners' Chronicle* are desirous of knowing how Fuchsias can be kept through the winter I have within these few days potted between 80 and 90 plants dug up last November from the open ground, which were afterwards taken into a cellar, their roots covered with sand, and then left to their fate. By this means I have not lost a single plant.—*J. Wedgwood.*

Bees.—I sympathise much with the young bee-keeper on the loss of so many bees, having suffered exactly the same from bad management in feeding. When I have neglected to follow Dr. Bevan's advice and directions, or when spring-feeding is absolutely necessary, the following plan has succeeded:—I had a wooden tray made nine inches square, and one-and-a-half inch deep, with another tray to fit in, the bottom of which is pierced zinc. The space between the wooden bottom and zinc (about half an inch) is filled with the food. I use the bee-boxes described in the "Conservative Bee-keeper," and place the feeder in the side box, in the warmest part of the day, withdrawing the partition, so that the bees are not exposed to external air; and if care is taken that the honey does not come through the zinc to make it sticky, no harm can happen—at least I do not lose them, as I formerly did. I should much like to know why bees are so very quarrelsome when they first come out in spring; and why, if the combatants are parted, they always resent the interference and try to sting the intruder.—*E. M. W.*

Spirits of Tar and Carrots.—Allow me to revert to your advice last spring, on Carrot-growing. We lost two crops, but at the third sowing we used spirit of tar as recommended. It answered perfectly, and we never before had such good Carrots. We also tried charcoal dust on the Onion-ground, but found they grew much larger when dressed with wood-ashes.—*E. M. W.*

Effect of Sulphur on Plants.—Being much annoyed by ants last summer in the forcing-pits and flower-garden, I used the following means to despatch them:—I made several holes with a stick in the ant-hill, and filled them up with sulphur. This had the desired effect, one or two applications being sufficient. Wherever the sulphur was used on the lawn, the grass in January and February became remarkably vigorous, making a small or large tuft of the deepest green, according to the breadth covered with the sulphur the previous summer. There is not at the present time so much difference in the colour as in the length of blade.—*H. Bowers.*

Rooks.—Noticing the subject of rooks in your work, I wish to point out a simple mode of preventing their depredations, which I have found to be most effectual. When the young rooks become perchers, it is usual to shoot numbers of them with air-guns, cross-bows, &c.; skin a few dozens and rub their skins with arseniacal soap, which will cost a few pence; stretch them on twigs and hang them up. When you sow Wheat, Potatoes, or any other crop, as soon as the rooks may be expected to attack them, place half-a-dozen of the dried (or stuffed, which may be better) skins on the field, and I will venture to say rooks will never alight on that field. You can, in due time, take them off, and place them on any other fields requiring protection; you will thus prevent the rooks from injuring your crops, and will have all the benefit of their valuable services in destroying grubs, &c., during most part of the year; every spring the perchers can be renewed, and you can distribute to your neighbours and the farmers hundreds of them to make pies of, and to cure the skins for themselves. If this be not a good suggestion, I am an—*Ignoramus.*

Rooks.—In "A Familiar History of Birds," a most amusing and instructive work by the Bishop of Norwich, the following passage occurs:—"As some persons may wish to establish a rookery in their own immediate neighbourhood, it has been said that by looking out for a magpie's nest near the wished-for spot, and exchanging her eggs for those of a rook, the desirable point may be accomplished, the young rooks having no other associations than those of the tree in which they were bred, and being sure of a harsh reception, if not of being picked to death, should they venture to join a neighbouring rookery in which they have no family connexions. The two or three pairs thus located would form the nucleus of a future rookery, and some idea may be formed of the ratio in which these birds increase from an instance mentioned in the same chapter from which I have taken the foregoing extract.—*E. S.*

PROCEEDINGS OF SOCIETIES.

AGRICULTURAL SOCIETY.

March 22.—The Duke of Richmond in the chair. Thirty-six gentlemen were elected. Mr. Burke laid before the council the manuscript of his work on "Cottage Economy and Cookery," which was referred to the journal committee.—Sir C. Burrell, Bart., M.P., communicated a letter on a remarkable crop of Oats; and Sir J. W. Lubbock, Bart., on the application of bones as a manure for grass-lands.—Mr. Shaw presented a specimen of the draining-tiles produced by Ainslie's patent machine, and also a communication from M. de Bonval on an improved system of husbandry; and Mrs. Coote, of Richmond Hill, near Clifton, a model of her sheep-weighing, dipping, and washing apparatus.—These communications were referred to the journal committee.

COUNTRY SHOWS.

Hammersmith Cucumber Show.—On March 12th, an exhibition of Cucumbers took place at Mr. Lidgard's, Thatched-House Inn, Hammersmith, when the following awards were made:—First Prize to Mr. Smith, of Hillingdon, for a leash of Weedon's sort 14in. in length. Second, to Mr. G. Mills, Gunnersbury, for a leash of a black spine variety, 20in. long. Third, to Mr. Thompson, Ealing, for a leash 15in. long. Fourth, Mr. Brown, Acton Green, for a leash 14in. long, grown in a Pine-pit; and Fifth, to Mr. Weedon, for a leash 15in. long.

Guildford Horticultural Exhibition.—The early spring show took place at the White Lion Inn, on the 23d March. The Cucumbers were generally fine; those that gained the first prize were about 13in. long; the Asparagus, Sea-kale, and Rhubarb were also of a superior description. The following was the award:—Best leash of Cucumbers, Mr. Daniels, gr. to H. Mangles, Esq.; 2d do., Mr. Burley, gr. to Mrs. Currie; 3d do., Mr. Sutton, gr. to Col. Mangles; best 50 Asparagus, do.; best Potatoes, Mr. Dickenson; best 18 stalks of Rhubarb, Mr. Rumsey; best Sea-kale, Mr. Daniels; 2d do., Mr. Adams, gr. to Mr. Bell.

Manchester Cucumber Show.—The exhibition was held at Mr. Bailey's, King William the Fourth, on Thursday, the 24th of March, and although there were not so many competitors as on former occasions, owing to the show taking place earlier than usual, yet the fruit was acknowledged to surpass any ever before exhibited in Manchester. After the show, 22 members sat down to an excellent dinner, and on the removal of the cloth several appropriate toasts were given. The following is a description of the fruit:—Premier Prize—For the best Brace, three competitors: 1st, Mr. Jas. Hamilton, gr. to F. A. Phillips, Esq.; sort, Hamilton's White Spine, grown in a pit heated with hot water, 21 inches long, same thickness throughout, short neck, flower on. Roman Emperor, same growth as the last, 19½ ins. long, short neck, same thickness throughout, flower on. 2nd, Mr. Walker, gr. to R. W. Barton, Esq.; sort, Walker's Pea-green, grown in a hot-water pit, 15½ inches long, slender but good, flower on. Infant—same growth as the above, 15 inches long, short neck, same thickness throughout, slightly ribbed, flower on. 3rd, Mr. W. Adderley, gr. to A. Orrell, Esq.; sort, Windsor Prize, slender, rather long-necked, 19 inches in length. Single Fruit, Hot-water Pit Culture: 1st, Mr. J. Hamilton, gr. to F. A. Phillips, Esq.; sort, Hamilton's White Spine, 21 inches long, short neck, fine form, good colour. 2nd, Mr. J. Walker, gr. to R. W. Barton, Esq.; sort, Infant, 15 inches long, short neck, prettily ribbed, flower on. 3rd, Mr. W. Adderley, gr. to A. Orrell, Esq.; sort, Windsor Prize, 19 inches long, slender. 4th, Mr. P. Mattershead, gr. to J. Barnes, Esq.; sort, Roman Emperor, 15 inches long.—Single Fruit, Frame Culture: 1st, to J. Worth, gr. to the Rev. E. J. Leigh; sort, Walker's Improved, 14 inches long, short neck. 2nd, Mr. Carr, gr. to Lt. Baharons, Esq.; sort, Allen's Victory of Suffolk, 15½ inches long, the only black spine exhibited.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CYNOGLÓSSUM ANCHUSOIDES. Bugloss-flowered Houndstongue. (*Hardy Perennial.*) Boraginaceæ. Pentandria Monogynia.—A hardy perennial, growing well in rich garden soil, and flowering freely in July and August. It is easily increased from seeds sown in the ordinary way, but the plants will not flower before the second season. It was raised from seeds received from the East India Company, said to have been collected either in Cashmere or Thibet, and presented to the Horticultural Society. In the general appearance of the flowers this plant has quite the appearance of an Anchusa; but its fruit is that of Cynoglóssum; surrounded with numerous stiff barbed spines, and merely rough, with hard sharp points on the disk. In this respect they are, however, variable, some of the nuts being merely muricated. We cannot recommend this species as a very ornamental plant; but it is interesting to those who cultivate rare hardy herbaceous plants.—*Bot. Reg.*

SAUSSU'REA PULCHELLA. Pretty Saussurea. (*Hardy Perennial.*) Compositæ-Cynareæ, § Carlineæ. Syngenesia Polygamia Æqualis.—To those who cultivate hardy herbaceous plants this is one of some interest, resembling a Liatris in colour and general appearance. It forms part of a genus abounding in species of a neat habit, and with flowers of various shades of purple, seldom exceeding a foot or two in height, and blossoming during the autumn. Mountainous pastures beyond lake Baikal, and moist meadows in Davuria, near the town of Nertschinsk, are the stations in which it has been found. In cultivation it is a hardy, pretty perennial, requiring the same treatment as the more delicate species of Centaúrea or Rudbéckia, and flowering freely in the open border during the months of August and September. When planted in the open border it is generally short-lived, owing to its blooming excessively, and therefore it is better to raise it from seeds frequently, in order to keep up a succession of plants. It was raised from seeds received from Dr. Fischer, of St. Petersburgh, at the garden of the Horticultural Society.—*Bot. Reg.*

CYPRIPE'DIUM BARBATUM. Bearded Ladies' Slipper. (*Stove Epiphyte.*) Orchidaceæ, § Cypripedeæ. Gynandria Diandria.—There is something in the habit of the Indian Ladies' Slippers so peculiar, that it was for a long time expected that they would be found to possess characters sufficient to separate them altogether from their associates. The fullest examination, however, shows this expectation to be fallacious, and that no peculiarity of organisation exists among them. In fact, the genus itself has been found to vary so much in the aspect of its species, that the common European and North American kinds convey no idea of its nature. In addition to the Indian forms, of which this may be regarded as a type, the hotter parts of America have furnished, on the one hand, the singular C. Lindleyanum, a hairy rufous plant with panicled flowers, and the scarcely less curious C. palmifólium, which bears the aspect of a Sobrália, and has its flowers in long racemes. The present species is a native of the Straits of Malacca, where Cuming found it on Mount Ophir. The purple hairy shining warts which border the upper edge of its petals distinguish it immediately from C. venustum and purpuratum, which are most like it. Persons who are unskilful in the cultivation of Orchidaceous plants manage the more common kinds of Cypripediums extremely well, and therefore it is only necessary to say that this species succeeds perfectly with the same treatment as C. venustum or insigne. The cultivator should not go to extremes with resting these plants, and should water with caution when they are just beginning to grow, as the young shoots are apt to damp off. They are terrestrial in their habits, and do best when grown in pots.—*Bot. Reg.*

GODE'TIA ALBESCENS. Whitish Godetia. Onagráceæ. (*Hardy Annual.*) Octándria Monogýnia.—A new hardy annual, not very handsome, but forming an agreeable variety, when grown among species of a more spreading habit. Like all the rest of the genus, which seems to retain the characters by which it is known from Œnothera, it is a native of America, having been obtained from the Columbia River for the Horticultural Society, from the late Mr. M. Dyer. Its stiff, close mode of growth brings it near Œnothera densiflora, from which, however, it is very different in other respects. The species belongs to that section in Gray and Torrey's Flora of North America, which comprehends Œ. viminea; and in some circumstances it approaches their G. Arnóttii, but that species is described with taper-pointed leaves, spotted flowers, a style longer than the stamens, and glabrous capsules; the flowers are moreover said to be as large as in G. Lindleyi. In cultivation this plant grows about a foot and a half high, and requires the same treatment as other hardy annuals. It may be sown in the open border in either autumn or spring, in some place where it is not exposed to the wind; because its roots are scarcely able to keep the heavy stem erect, if the latter is much blown about.—*Bot. Register.*

BABINGTÓNIA CAMPHOROSMÆ. Camphorwort Babingtonia. (*Greenhouse Shrub.*) Myrtaceæ, § Leptospermeæ. Icosándria Monógynia.—Among the many curious plants made known to botanists by the discoveries in the Swan River and adjacent colonies, some of the most interesting occur in the Myrtaceous order, to which a variety and extent have thus been given which could not have been anticipated. We now find in this great natural assemblage every variety of habit, except the herbaceous: tiny shrubs looking like Heather, and monstrous trees which form the pillars of the wilderness, aromatic fruits and hard woody seed-vessels, a most complicated organisation as in the Pomegranate, and great simplicity of fructification as in the Fringe Myrtles. Individual parts too have their own extensive variations, seeds, placenta, stamens and anthers, calyx, corolla and bracts; even the foliage itself forms a large field of study for the investigator of comparative organisation. The plant before us, in the eye of the gardener, is merely a pretty shrub, rendering the greenhouse gay in autumn and winter; but to the botanist it presents some most remarkable features. It is a greenhouse shrub, very graceful in its habit, and not difficult to cultivate. It does not seem to like a loamy soil, but grows well in rich brown peat and leaf-mould, and flowers freely during the summer from the ends of its pendent branches. Cuttings of the young wood, a little firm at the base, root very soon in sand when covered with a bell-glass in the usual way. It can be propagated any time from spring to autumn. Mrs. Molloy, a lady to whom we are indebted for seeds from the Vasse River, says, that it grows there in swampy land, resembling our Spiræ'a frutex (S. hypericoides), that it grows seven or eight feet high, and in summer forms a delightful shade to the traveller crossing the swamps. It was first flowered by Mrs. Wray of Cheltenham.—*Bot. Reg.*

CIRRHOPE'TALUM MEDUSÆ. The Medusa's-head Orchis. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This most singular plant is a native of Sincapore, whence it was obtained by Messrs. Loddiges. It resembles C. vaginatum, but is a much larger plant, and very different in the form of its flowers. Certainly if ever there was a Medusa this must be the prototype, before her Gorgonship's beautiful tresses were changed into serpents; nor are wanting the scales with which her form was safely guarded. To grow it well the temperature and moisture of the Orchidaceous stove is required. It may be fixed to a wooden block, and suspended from the rafters; but if treated in this manner, a quantity of sphagnum, or turfy peat, ought to be packed round the stem to retain moisture. It ought never to be kept too dry, but of course it requires more water when growing than when resting.—*Bot. Register.*

MISCELLANEOUS.

On Preserving Timber from the White Ant.—The well-known effects of corrosive sublimate, in protecting objects of natural history from the attacks of insects, induced me to make a trial of its power of preserving timber, carpets, &c., from the destructive inroads of the white ant; and I am happy in being able to say that the experiments I made were perfectly successful, and justify the hope that, by the means now recommended, we shall soon drive these destructive insects from our houses—or, at all events, render their visitations comparatively harmless. The strength of the solution I used, was one ounce of the corrosive sublimate to one gallon of water, having previously rubbed the mineral up with a little alcohol to increase its solubility; wood was immersed in the solution for one week, but carpets and cotton cloth were allowed to remain only for two days. The experiments I varied in every possible way, and uniformly obtained the same result, viz., that the white ant will but very partially, if at all, destroy the substance of anything macerated in the solution, and that on discovering its nature they immediately disappear. With woollen cloth the effects were less decisive, as the solution appears to be unable to penetrate the fibres of the wool, and is partially removed by washing—but under cotton carpets, rush mats, &c., the insects will burrow for the first day or two, and then disappear; and with regard to timber they are even more fastidious, as I have observed in their covert ways, that they had placed a coating of earth between themselves and the wood; evidently anxious not even to come into contact with the poison. The advantages of preparing wood in the way recommended, are not, however, confined to its immunity from the attacks of the white ant—as it is now generally known that the same preparation (Kyan's patent) effectually resists dry rot or other decay; and from the power it is known to possess, of coagulating the albumen contained in the wood, and indurating the fibres of the softer and cheaper varieties of timber, and rendering them immediately fit for use, if cut down even in a state of active vegetation, are circumstances well worthy of public attention. The method I believe at present adopted, for preserving the wood of public buildings from attacks of the white ant, is by the application of mineral oil; and its effects are but temporary, as it appears to depend upon its disagreeable odour—as it is only by the repeated renewal of the application that the wood is protected; but by using in its stead a solution of the muriate of mercury, no repetition of the process would be necessary, either to guard against the destructive effects of time, or the more sudden and injurious inroads of the white ant.—*Madras Journal.*

Evergreens.—"I differ with the doctors about planting Evergreens in spring; if it happens to be wet weather, it may be better than exposing them to a first winter; but the cold dry winds that generally prevail in spring are ten times more pernicious. In my own opinion, the end of September is the best season, for then they shoot before the hard weather comes."—*Horace Walpole, page* 176, *vol.* 3, *N. Ed.*

The Thya or Thyion of Theophrastus and Citrus of Pliny.—In a late number of the Proceedings of the Académie des Sciences there appeared a memoir upon the Thya of Theophrastus, by M. Jaume St. Hilaire, in which, after quoting passages from the works of ancient authors, he rejects the present application of the word, and adopts the opinion of various modern travellers (amongst others of MM. Della Cella and Pacho) that it is no other than the Juníperus phœnícea, which abounds in that part of Africa, mentioned by Pliny and Theophrastus as the native country of the Thya. The author is also led to believe that this tree, observed by M. Pacho in Cyrene, might be likewise found in some of the African districts in the possession of France, and that it should be principally sought on the east of Constantina. This discovery might prove not only of scientific, but commercial interest. Subsequent to this there appeared in the same work an article by M. Thiébaut de Berneaud, who, after minute investigation, still believes that the Thya of Theophrastus (Citrus of Pliny) should no longer be sought in continental countries, but in the adjacent islands; and moreover that it was not (as supposed by M. Jaume St. Hilaire and other writers) the Juníperus phœnícea, but the Pinus canariensis of Broussonet.

A hardy sort of Rice.—The Rev. M. Gabet, a French missionary at Jehat, in Mongolia, has lately forwarded to France a variety of Rice which may turn out very useful to the agriculturists of other countries. Whilst the Rice hitherto cultivated requires a damp soil and irrigation, the present variety grows in dry localities, and is cultivated like Wheat. A distribution of the seed amongst the agriculturists of France has been ordered by the Académie des Sciences, and as this variety is mentioned in Chinese works, M. Stanislas Julien has printed from the Chinese "Cyclopædia" some notices relating to its mode of culture; amongst which the following possess the greatest interest:—"This species of Rice at the present time is cultivated in the province of Fokien. It requires to be sown on an elevated situation, being equally productive in the northern and more arid region of China, and in those parts where the supply of water is more plentiful. In general, it is sown and cultivated exactly in the same manner as Wheat. When the ground is prepared, the seed is steeped in water for one night; after sowing it, the land is well soaked with water in which the ASHES OF RICE-STRAW have been previously mixed. It is then hoed at three different times, and is each time watered with liquid manure.

Nocera Onion.—This is a small white Italian Onion, which comes in very early; when sown side by side with the early white Onion, it was fit for use nearly a month sooner than that variety. It forms its bulbs very quickly, sometimes when the plants have not more than three or four small leaves. It is probably identical with the long-lost small white Florence Onion; it is a pretty variety, excellent for pickling and for stews, but it is difficult to keep true. It is much used at Naples, and grown at Nocera, near Vesuvius, whence seeds were brought by M. Audot.—*Bon Jardinier.*

The Artichoke-leaved Lettuce.—This variety is related to the Spinach and Oak-leaved Lettuces, but it differs from them in its foliage being more deeply tinted with red, and in its qualities. It is a strong grower, very large, and late before it runs to seed. The leaves are long, narrow, and pointed, with large lateral teeth, which give them the appearance of Artichoke leaves: they are dark green, sweet, and slightly bitter; but when they are blanched by tying up, they lose their bitterness. They are very tender, and more agreeable in flavour than those of other Lettuces. The most valuable property which this variety possesses as a summer and autumn Lettuce, is the lateness of its running to seed. When the seed is sown in the open ground early in the spring, the plants form in June in large tufts, not displayed in rosettes like Endive, but in bundles, in consequence of the leaves growing upright: these tufts increase in size till September, and do not flower till so late that the seed is scarcely ripe before the first frosts occur. The interior leaves blanch naturally, but it is better to tie the plants up. If seed is sown in June or July, then the Lettuces are excellent for using late in the autumn, which is not the case with Cos Lettuces, which are not good after their growth has been checked by the frost. Like Endive, this Lettuce may be preserved in a cellar for a month or more.—*Bon Jardinier.*

GARDEN MEMORANDA.

Henderson's Nursery, Pine-Apple Place.—The show-house at this place is gay, although the Hyacinths, for which it is justly celebrated, are nearly over; a few are still growing in Beet-roots, in which they succeed tolerably well. A small plant of Azalea variegata, and a hybrid Chinese variety, resembling the old phœnícea, but paler, are now in flower, the latter being a complete mass of bloom. In the stove we noticed Oncidium lúridum, and a remarkably fine specimen of Gongora atropurpúrea, in flower; also Æschynanthus parasiticus, and Colúmnea Schiediana, a singular plant, nearly allied to Gesnera, with dull orange-coloured flowers, spotted with red. Amongst the plants in bloom in the Orchidaceous house, are a small sweet-scented Rodriguézia (which loses its perfume as the day advances), Maxillária Harrisóniæ, Oncídium púmilum, and Saccolábium micranthum, with its pretty wax-like flowers. One thing worthy of notice in this house, and which shows the strength of the vital principle in some plants, is part of a branch of the Calabash tree, which, when received from Trinidad, with an Oncídium growing upon it, was to all appearance dead; but although so many months had elapsed, after being covered with moss, it revived, and has already made shoots two feet long. The pits are chiefly filled with Heaths and Cinerárias, amongst which are many excellent seedlings, one a light blue with a white centre, and another similar to C. grandis, but of a brighter colour. There is also a very pretty seedling Epacris, with pink and white flowers, in habit resembling E. grandiflora; we understand it to be named Atleeana.

Reviews.

The Year Book of Natural History for Young Persons.
By Mrs. Loudon: Murray. 18mo.

BOOKS on Natural History, purporting to be for children, are generally so bad that they are the last things we would place in the hands of the young. The interest taken in such writings when the infant mind is just beginning to expand, is sure to cause them to make a strong impression, and so to fix themselves on the memory that the errors they convey are among the most difficult of all things to remove in after life. It is therefore of the first importance that children's books should convey correct information, however slight it may be. In our opinion Mrs. Loudon's work is not only free from all objections on this score, but is exactly what we should have wished it to be; it is in all respects such as a parent would desire to place in the hands of a child. The facts adverted to are numerous, well elucidated, and told in the plain language that alone can interest the young. They are selected, moreover, from among the most common occurrences that meet the eye of childhood. We regard this as the best book on Natural History that has yet been written for children.

The Quarterly Journal of Agriculture, and the Prize Essays and Transactions of the Highland and Agricultural Society of Scotland. No. 56. Blackwood.

OF this important periodical the number before us is one of the best, abounding, as it does, in sound practical papers, upon highly interesting agricultural questions.

A sketch of the writings of the agricultural authors of the latter part of the seventeenth century, by Mr. Cuthbert Johnson, contains some passages of striking interest, and is otherwise very amusing. Speaking of Hartlib, his advocacy of spade husbandry is pointed out, and we have the following singular statement, serving to show that an unwillingness to adopt improvements of the most obvious importance is by no means a peculiarity of the agriculturists of our own times.

"Hartlib was warmly in favour of spade husbandry, describing it 'as good as three ploughings,' and that 'all the weeds and grasses might be more easily destroyed thereby, and the croppe evidently greater.' He recounts some of the traditionary stories of his day, as well illustrating the prejudices of the time with regard to digging even in gardening; he says, 'Some old men in Surrey, where it flourishes very much at present, report, that they knew the first gardeners that came into those parts to plant cabbages, colleflowers, and to sowe turneps, carrots, and parsnips, to sowe raithe, rape, pease, all which at at that time were great rarities, we having few or none in England but what came from Holland and Flaunders. These gardeners, with much ado, procured a plot of good ground, and gave no less a sum than 8*l.* per acre, yet the Gentleman was not content, fearing they would spoile his grounde, because they did use to dig it, so ignorant were we of gardening in those days."

Worlidge, we are told, "extols the use of steeps for seed-corn, mentions with approbation for this purpose, nitre, common salt, as well as urine, and gives a recipe for making a kind of liquid manure with sheep-dung (½ bushel), saltpetre (½ pound), and common salt (1 pound), boiled together for ten minutes in water (20 quarts), and this he commends very highly as a steep; and," says Mr. Johnson, "I am inclined to believe that something of this kind of rich liquor, more especially if the seed was afterwards dried by being sprinkled with some of the very fine manure-powders at present proposed, such as the urate of the London Manure Company, the composition of M. Poittevin, the guano, gypsum powder, &c., might be used more profitably by the cultivator than at first sight he may be inclined to believe."

Of Dr. Madden's prize essay on the advantages likely to accrue to Agriculture from Vegetable Physiology and Chemistry, we can only say that it really deserves the most careful consideration of both practical and scientific men. It will scarcely admit of extracts such as we can find room for.

A paper by Mr. Grey, of Dilston, on the relative effects of recently-introduced manures, admits of being abstracted. This experienced cultivator tried against each other, on good gravelly loam, nitrate of soda at the rate of 1 cwt. to the acre, gypsum at the rate of 10 bushels to the acre, and a mixture of gypsum and nitrate. The following was the result:—

"1.—112 square yards, without any manure, produced 9 stones 4lb. of hay, weighed when newly made, equal to 2 tons 81 stones per acre.

"2.—112 square yards, to which gypsum had been applied at the rate of 10 bushels per acre, gave exactly the same result, so that no benefit arose from its use in this instance. It must be remembered, however, that the grasses are of the ordinary kinds used in pasture, i.e., White Clover, Rye-grass, Timothy, &c., but without Red Clover, to which gypsum is known to be beneficial.

"3.—112 square yards, to which nitrate of soda had been applied at the rate of 1 cwt. per acre, produced 14 stones 7 lb.; equal to 3 tons 146 stones per acre, being an increase of 1 ton 65 stones over 1 and 2.

"4.—112 square yards, to which both nitrate of soda and gypsum had been applied in the above quantities, produced 14 stones, equal to 3 tons 125 stones per acre, and 21 stones less than the produce where nitrate was applied alone.

"The cost of the nitrate on the ground was 22s. per cwt., and the increased value of hay per acre, as it stood in the fields, would be from 4*l.* to 5*l.*"

Nitrate of soda was also used for Potatoes, at an early period of their growth, but not with advantage. The Potatoes ran much to stem and leaf, and produced an inferior crop. A mixture of manganese and nitrate of soda was inferior in its effects to the nitrate alone. When applied to Rape, previously dressed with bone manure, the crop so treated was in one month twice as high, and double the weight of the rest of the field. The part dressed with guano, although improved by it, was much inferior to that on which the nitrate had been scattered. Second year's grass and tares also exhibited a manifest improvement; upon corn, however, the nitrate did not produce any advantage; on the contrary, the straw was profusely formed, but coarse, and the quantity of grain small. In conclusion, Mr. Grey says, "The results of numerous experiments which I have made with nitrate of soda, lead me to the determination, in my own practice, to use it as much as possible on grass and green crops, but cautiously on grain crops, and only in such situations as run no risk, be the weather as it may, of the corn being lodged from too great a growth of straw. I have satisfied myself that I can obtain the requisite quantity of hay upon two-thirds, or rather less, of the land which I have hitherto assigned to it, by the application of nitrate of soda to the grass, so that I have one-third of the land at liberty to feed sheep. I am also satisfied that its application to pasture-land increased the produce at any rate by one-third, and to Rape, in one instance at least, by one-half. The consequence of which must be an extra production, in equal proportions, of mutton and wool, and an additional return of manure from the sheep to the land, which will produce its effects upon the succeeding crops of grain, not by stimulating a rapid growth at any particular stage, but by entering gradually and regularly into the whole process, from the germination of the seed onward to the maturity of the crop."

A most remarkable history of the rapid improvement of boggy land in Scotland is fully given by Mr. Boswell of Kingcausie. The land subjected to improvement is thus described:—

"The farm of Swellhead, now under report, fell out of lease at Martinmas in the year 1834, and was taken by the reporter into his own hand. At this period it was in all respects of the same character and aspect as the surrounding country, the greater part of it having been rented on a 19 years' lease, at 52*l.* per annum. This farm consists of two slopes and two flats, the slopes being full of stones and rocks, not only in the shape of large boulders of gneiss or granite, but also an extraordinary quantity of smaller stones, while the two flats were deep peat bog, from four to nine feet deep, or wet quagmire. The farm-buildings consisted of a few miserable hovels, built of dry stone, with turf gables. The stock it could keep was generally from 12 to 14 beasts of all sorts, cows, calves, and oxen, with a couple of small garrons of horses. There were no enclosures, no shelter, not a tree or a bush. The cattle were either prevented from destroying the patches of corn by a *flibberty gibbet* of a herd-boy, or shut up in a fold, the fence of which was a crooked 'rickle dyke' (here to ruminate on their starving condition). Thus with coarse herbage for food, the cold blast constantly blowing upon them, and wet under foot, they seldom arrived at that pitch of fatness which excludes cattle from a prize at the show of the Highland Society; they seldom appeared to be over-fed! The last year of the lease, the tenant, as is usual, made every inch into crop which he could plough, or rather *scratch*, and this crop having been bought by the reporter, proved to be nearly fifty-two bolls. Thus the tenant paid 1*l.* of rent for every boll of grain he grew, and had a large tract of pasture as his profit: such was the state of the farm at Martinmas 1834."

After eight years, and the outlay of 5,400*l.* upon 280 acres, this estate, worth in 1834 52*l.* a-year, had become of the yearly value of 500*l.*

"Last winter there were about 60 head of cattle tied up to full Turnips, the half of them being fed for the London market; the quantity of grain was 369 qrs. of Oats and 42 qrs. of Barley. Some of the Oats grown on the improved bogs of Swellhead weighed 44 lbs. per bushel; they were of the new sort called 'Scots Barley,' and were sent as seed to England. This year there are 2,538 thraves of Oats; and the sheaves being very large, the quantity of grain ought to be considerably increased as compared with last year. There are about 45 acres of good Turnips, so that the same quantity of cattle will be tied up as last winter, and there is not at the present moment a wet spot or a weed on the whole farm."

The importance we attach to this publication is shown by the length to which our extracts have already extended. We must still find room for the experiments on ammoniacal liquor, &c., conducted by Mr. Bishop, land-steward to R. Smythe, Esq., of Methven Castle, in Perthshire. In these experiments four Scotch acres of grass-land were severally dressed with 1 cwt. of nitre, 1½ cwt. of nitrate of soda, 5 cwt. of rape-dust, and 105 gallons of ammoniacal liquor diluted with five times the quantity of common water. The result of this is given as follows:—

"The acre of ground dressed with the nitrate of soda was the first that showed its stimulating powers, by the dark greensward which it had acquired in eight days. The ammoniacal water was the next, and was equally vigorous in twelve days, and soon surpassed all the other dressings for the season, the scorched parts gradually narrowing with borders of luxuriant herbage. The sward, dressed with rape-dust, was the latest that exhibited any benefit from its application, but improved greatly as the season advanced; and from the extra quantity that had been dropped around the bag at the time of sowing it, gave evidence that the proper quantity had not been applied, to show fully its fertilizing effects, as the produce on this spot was not surpassed by any of the other dressings. The produce in grass from 31 square yards, carefully measured on a crossing line and weighed, was from the acres dressed with nitre, nitrate of soda, and rape-dust, nearly the same, averaging from 98½ to 100 lbs. The space dressed with nitrate of soda and salt 82 lbs., and the undressed 55 lbs.; whilst the pruduce from the dressing with ammoniacal water weighed 126 lbs. The produce in hay made from the different parcels of grass, carefully kept separate and weighed on the 2d of August, in good condition, was similar in proportion. After the dressing with nitre, nitrate of soda, and rape-dust, giving 31, 32, and 30 lbs., being on the average one pound weight of hay from the square yard; that after the mixture of soda and salt somewhat less, and that from the undressed land only one-half pound; whilst that dressed with ammoniacal water weighed 46 lbs., or a pound and a half per square yard, equal to 326 stones of hay per imperial, or 410 stones of 22 lbs. each per Scotch acre."

In another experiment with lime-shells slackened with bog-earth, slightly fermented bone-dust, cocoa-nut dust, animalized carbon, and bone refuse, tried against ammoniacal liquor, this agent evinced an equal superiority. "The acre dressed with cocoa-dust was the next that showed its fertilizing influence, and the two acres with animalized carbon and the refuse of bones the latest."

We must refer our readers to the work itself for the particulars connected with these very important facts.

CALENDAR OF OPERATIONS *for the ensuing week.*

This season of the year is said by many to be the most favourable for the planting of evergreens. This, however, is a disputed point, upon which great difference of opinion prevails, some writers giving their testimony in favour of autumn, others advocating the present time, while a third party go still further into summer. There can be no doubt that with proper care evergreens might be successfully removed at any of the periods advised; it is also equally certain that, where the situation is not low and wet, or the ground naturally adhesive, autumn-planting will insure the most success with the least subsequent attention; therefore, autumn-planting is generally preferable; but the manner in which this operation is done is of quite as much consequence as the time of doing it. Instead of grubbing up a plant which has a large top and ample foliage with no more roots than would fill a good-sized flower-pot, every fibre ought to be preserved, if such were practicable. With this view, a deep trench should be dug round the plant, further from its stem than the roots are supposed to extend, and the intermediate soil not dug with a spade, but worked out with picks or forks. In planting, too, it is not sufficient to lay the roots out straight, and cover them with fine soil; they ought, when thick and bushy, to be carefully separated, and each layer covered with fine soil, always spreading it from the stem of the plant in the direction of the roots, that they may lie straight and not be doubled up or twisted, which will unavoidably take place if the earth is thrown in carelessly. "Puddle" planting has been recommended; but if by this is meant sinking the roots into a mass of thick mud, nothing can be more contrary to nature. The soil when put among the roots ought to be sufficiently friable to break freely, and by no means wet. After all the roots are covered, and before the filling of the hole is completed, a good watering should be given, throwing in the remainder of the soil after the water has entirely subsided; neither must it be trod or pressed in any way. Failure will rarely happen if these directions are followed in planting at this season; but in particular cases the precautions mentioned last week should be observed.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—More heat and less moisture must be given to plants that are wanted to start into fruit about May. If the artificial temperature has hitherto been from 60° to 65°, it should now be increased to 70°, with less air in the day. If necessary, increase the bottom heat also, which should range between 85° and 95°. Take care that the renewed beds for the succession plants do not heat violently. If above 95° at the bottom of the pots, draw more of the bark away from them. The plants will now require occasional light waterings at the root, for which purpose soft water a little warmed should be used. Shading will only be required now on very bright days.

Vinery.—If the fruit in the earliest house has begun to change colour, syringing must be entirely discontinued. It is at this stage that the "bloom" is formed, and if once destroyed it cannot be reproduced. The floors may be wet as usual in warm days. When the roots are within the house, the watering of the borders must be regularly attended to. An insufficient supply of food when the Grapes are swelling off after stoning, at which period every rootlet and every leaf are taxed to the utmost, to furnish the immense quantity of nutriment required, must necessarily be detrimental to the fruit, as will be shown by badly-swelled or imperfectly-coloured berries, or by that withering of the peduncle or pedicels which is generally termed "shanking." On the other hand, avoid making the borders so wet as to rot the tender spongioles, or check their free action. Dung-water may be given with advantage.

Peach-house.—Thin the fruit freely in the second house if a heavy crop is set and swelling, leaving, however, a sufficient extra number till after the stoning process is completed. Give abundance of air to the latest house so long as the trees are in blossom. If mildew appears, dust the leaves with flowers of sulphur.

Cherry-house.—The trees in the first house must be regularly watered, both at root and top, until the fruit shows indications of ripening, when more air and less water will be necessary. When the weather is fine, give air liberally to the later houses.

Fig-trees in pots, whose fruit have reached the critical period of forming the seeds, which appears to take place when the Figs are nearly or quite full-grown, must be carefully guarded against every kind of check, or they will be very likely to cast their fruit. A regular temperature not exceeding 60° at night, or 75° in sunshine with air, moderate syringing, and water at the root only when required, is proper treatment.

Cucumbers and Melons.—When cold winds prevail, caution must be exercised in admitting air. The advantages of the moveable pieces of wood described in a former Number will now be seen. Or, if these are not used, fasten strips of matting, or coarse canvas, over the openings. Sprinkle the plants lightly when the frames are closed, which should be early.

Mushroom-house.—Wheel out exhausted beds to make room for new ones. Any part of the old material which contains spawn might be worked up with the fresh droppings into new beds.

Potatoes in frames will require watering occasionally. Expose the foliage to the free light and air at every favourable time. If tubers are forming at or near the surface of the ground, the plants should be earthed-up lightly.

Out-door Department.

Beans.—Earth-up the transplanted ones, and put in another crop, if those last sown are fairly up.

Cauliflowers.—Sow for an early autumn supply.

Celery.—Sow on a warm border and rich soil the principal crop to be used after Christmas, the previous sowings not being intended to stand the winter.

Hamburgh Parsley.—A sufficient stock should now be sown to supply roots next winter for kitchen purposes.

Mustard and Cress.—Sow at the foot of a south wall.

Potatoes.—Continue to plant, as the winter crops of Borecole, Brussels Sprouts, and other greens are cleared away.

Rhubarb in the open ground may be blanched as it grows, by excluding the light with Sea-kale pots, or any convenient substitute.

Spinach.—Hoe between the rows of the autumn crops. If the ground is poor, a good soaking of dung-water will increase and prolong its produce.

Orchard.—Get all the Strawberry beds weeded before the plants have grown much; and see that they are not trampled upon, as is frequently done. The grafting of forward trees should be finished. Apple and Pear trees which have large branches should be worked with strong scions of two or three years old wood in preference to slender last year's shoots.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Syringe with caution, particularly in light iron houses. Train the plants to stand as much light as possible, in order to prevent them from being drawn. Introduce a few more Cacti for early flowering; pot off the seedling plants, and keep them in a warm and shaded frame for a few days. Very little fire will be wanted at night; give air on warm days, and shut up early.

Greenhouse and Conservatory.—Young Camellias that are wanted to grow freely should be removed from the greenhouse to a warmer situation. The advancing shoots of Corræas, Chorozemas, and similar plants should be stopped now and then, to give the plants a compact and bushy habit. The flowers of Tropæolum tricolor should be constantly nipped off until the shoots nearly cover the frames they are trained upon; Leschenaultia formosa, also, or any other plants that are wanted to make growth, ought not to be allowed to produce flowers. Occasional syringings will benefit the plants generally, but the foliage of Heaths, &c. will not bear much moisture. The conservatory borders will now require more water.

Pits and Frames.—If Cockscombs and Balsams are wanted to grow large, their roots must never be suffered to become matted; let them be regularly potted, therefore, in rich soil, and keep them very near the glass. The same rule is also applicable to other tender annuals, and to Lobelias. Continue to propagate Dahlias by cuttings, and prick out seedlings when they are large enough. Expose annuals, and all plants intended for bedding out, to the air at every favourable time. Sow Tobacco in heat to raise a supply for fumigating.

Out door Department.

In this department the principal sowings and plantings will now most likely be over for a short period, and this respite will allow more time to be devoted to the rolling of the walks, the rolling and sweeping of the lawns, and to general neatness. Finish the raking of flower-borders, if not already done. Bulbs of Tigridias (not those forwarded in heat, but dormant ones may be planted.

NURSERY AND FOREST DEPARTMENT.

Nursery.—The layering of trees and shrubs ought to be completed as soon as possible, before the buds burst into leaf. Continue to plant out seedling Rhododendrons, &c., from the seed-pans. If any seeds appear above-ground, the young plants must be carefully guarded against slugs.

Forest and Coppice Woods.—Sow now in the plantations, to make cover for game, Furze, Broom, and Privet seeds. The Snowberry plant (Symphoria racemosa) is said to give both shelter and food to game.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending March 31, 1842, as observed at the Horticultural Garden, Chiswick.

March		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	25	30.120	29.607	54	36	45.0	W.	.07
Saturday	26	29.629	29.581	50	29	39.5	N.W.	.01
Sunday	27	29.763	29.746	52	41	46.5	W.	.02
Monday	28	29.740	29.704	60	47	53.5	W.	
Tuesday	29	29.961	29.880	59	48	53.5	W.	
Wednesday	30	29.914	29.826	59	42	50.5	S.W.	.05
Thursday	31	29.795	29.426	56	43	49.5	S.W.	.13
Average		29.841	29.680	55.7	41.0	48.3		.28

March 25. Overcast; cloudy; stormy with rain at night.

26. Clear; cloudy with brisk cold wind; clear and slight frost at night.

27. Clear; cloudy and fine; overcast, with slight rain.

28. Overcast and fine.

29. Cloudy; very fine; densely overcast.

30. Overcast; brisk wind with small rain; heavy shower in afternoon; fine.

31. Rain; cloudy with slight rain; densely overcast in the evening; very boisterous, with rain at night.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending April 10, 1842.

April		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 5th, 1832—thermometer 74°; and the lowest on the 4th, 1830—thermometer 24°.

REPORT ON COVENT GARDEN MARKET,

For the week ending April 1, 1842.

The market has been well supplied with most articles during the past week, and trade has been somewhat brisker.—*Fruit.* Excellent Pines are tolerably plentiful at from 8s. to 12s per lb. A few hothouse Grapes may be obtained; foreign are almost past. Apples remain at the same prices as last week. Good Pears are not scarce; the kinds are chiefly Beurré Rance and Easter Beurré. Strawberries are becoming more plentiful. Good Cucumbers are worth from 3s. to 8s. per brace.—*Vegetables.* The supply of Broccoli is fast diminishing, and the price has consequently risen. Brussels Sprouts are almost past; those that are offered are indifferent. Kidney-Beans are abundant, but they do not meet with a ready sale. New Potatoes are becoming more plentiful, and are rather lower in price than they were last week. Asparagus is generally excellent, and the supply pretty large. Sea-kale abounds. Spring Radishes are abundant and good, but most kinds of Salading are indifferent. Handsome bundles of Rhubarb are plentiful: the kinds mentioned last week are still offered.

PRICES Saturday, April 2, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3s 6d to 5s
— Dessert, per bushel, 5s to 12s
Pears, dessert, per half-sieve, 2s 6d to 16s
Strawberries, forced, per oz., 1s 6d to 2s
Pine Apple, per lb. 8s to 12s
Cucumbers, per brace, 2s to 8s
Grapes, hothouse, per pound, 25s
— Spanish, per lb., 1s 6d to 2s
— Portugal, per lb., 1s to 5s
Oranges, per doz., 1s to 2s 6d
— per 100, 4s to 16s
— Bitter, per 100, 6s to 16s

Lemons, per doz. 1s to 2s
— per 100, 6s to 14s
Almonds, per peck, 7s
Sweet Almonds, per pound, 2s 6d to 3s
Chesnuts, per peck, 5s to 8s
Walnuts, per bushel, 16s to 24s
Cobb Nuts, per peck, 3s 6d
Nuts, per bushel—
— Brazil, 20s
— Spanish, 16s
— Barcelona, 20s to 24s

VEGETABLES.

Savoys, per dozen, 1s 6d
Cabbage, Red, for pickling, 2s to 6s
Cabbage Plants, per doz., 3s to 6s
Brussels Sprouts, per hf. sve., 1s 6d
Broccoli, White, per bunch, 1s to 3s
— Cape, 9d to 1s 6d
— Brown, 1s to 1s 3d
— Sprouts, per sieve, 1s 6d to 2s
Turnip Tops, per bushel, 6d to 1s
Kidney Beans, forced, p. 100, 1s 6d to 2s 6d
Potatoes, per ton, 50s to 70s
— per cwt. 2s 6d to 4s
— per bushel, 1s 6d to 2s 6d
— Kidney, per bush. 2s to 3s
— New, per pound, 3s to 4s
Turnips, per dozen bunches, 1s 6d to 2s
Carrots, per doz. bunches, 4s to 5s
Parsneps, per dozen, 6d to 1s
Red Beet, per dozen, 6d to 1s 6d
Horse Radish, per bundle, 1s to 5s
Radish, per doz. hands (24 to 30 each) 1s to 2s
— Turnip, per doz. bunch., 3s to 4s
Spinach, per sieve, 1s 6d to 2s
Chives, per pot, 6d
Leeks, per dozen bunches, 9d to 1s 6d

Garlic, per lb. 8d
Shallots, per lb., 1s
Onions, per half sieve, 2s to 3s
— for pick., per hf.-sieve, 3s to 4s
— Green, per doz. bunches, 2s to 4s
— Spanish, per dozen, 1s to 5s
Asparagus, per 100, large, 7s to 12s
— Second or Middling, 2s to 3s 6d
— Sprue, or Small, 2s to 3s
Sea-kale, per punnet, 1s to 2s 6d
Lettuce, Cabbage, per half sieve, 1s 6d to 2s 6d
Endive, per score, 1s to 2s
Celery, per bundle (12 to 15) 6d to 3s
Small Salads, per punnet, 3d
Corn Salad, per half sieve, 9d
Watercress, p. dz. small bunch. 7d to 9d
Parsley, per half sieve, 1s to 2s
Tarragon, per dozen bunches, 3s
Fennel, per dozen bunches, 3s
Thyme, per doz. bunches, 2s
Sage, per doz. bunches, 3s
Mint, per dozen bunches, 4s to 12s
Rhubarb Stalks, per bundle, 6d to 2s 6d
Mushrooms, per pottle, 8d to 1s
Truffles, per pound, 3s to 3s 6d

Notices to Correspondents.

C. O.—We have no complete set for 1841 remaining; about 40 of the Numbers may be had.

Country Shows.—We take the liberty of reminding our country friends that if they wish their days of meeting to be noticed by us weekly, it is necessary that their lists should be forwarded to us as soon as the days are determined on.

Will any Correspondent favour us with the mode of growing Asparagus at Vienna? At that place the shoots are long, large, delicious, and every morsel eatable, very unlike the drumsticks called Asparagus by courtesy in London.

G. W.—Your Mosses are—1. Sphagnum obtusifólium; 2. Sphagnum acutifólium; 3. A Bryum and Jungermánnia mixed; 5. Hypnum scorpioides; 6. Polytrichum vulgare. Nos. 1, 2, and 5 are most suitable for growing Orchidaceous plants in; and no doubt the peat you have enclosed is also well adapted for the same purpose. Old rough branches of Elder are very proper to fasten some varieties upon, protecting their roots with either of the three mosses mentioned above; and copper-wire will not be injurious to them. Your Phaius turning black was probably owing to the coldness of the fresh bark; but as you did not mention whether your bark-bed heated or not, it is impossible to judge correctly. Passiflora quadrangularis requires a plentiful supply of water whilst swelling its fruit.

J. W.—We should expect Guano to answer the purpose of the night soil used at St. Sebastian as a top-dressing for Asparagus beds in the autumn; and it is probable that nitrate of soda would supply the place of salt for the spring inundation; but why not use salt and water of the strength of sea water?

G. B. D.—Fuchsia affinis bears so great a resemblance to F. radicans that they can scarcely be considered distinct species. The latter has frequently flowered in this country. The calyx is of a bright scarlet colour; that of the petals, a deep purple.

R. D.—The last edition of the Fruit Catalogue of the Horticultural Society is the second, published in 1831. The best of the late Pears are, Hacon's Incomparable, Passe Colmar, Beurre Rance, Ne plus Meuris, Glout Morceau, Nelis d'hiver, Easter Beurré, and, though a very little one, the Bezy de Caissoy, or Nutmeg.

Veritas.—Do not water Lílium lancifólium with manure-water until it is making vigorous growth; it may then be done with safety, preparing your liquor from fresh manure. Calochortus venustus is a handsome plant; its high price is owing to the difficulty with which it is propagated. We do not know the Glycine Harrisónia.

A Subscriber.—If gypsum is to be used for fixing ammonia, it should be ground into fine powder, and not burnt.

A Subscriber.—The following climbing Roses are suitable for training up poles:—*Noisette:* Fellemberg, La Marque, Sir Walter Scott, and La Biche. *Ayrshire:* Ruga and Myrrh-scented. *Boursault:* Elegans and red. *Sempervirens:* Félicité perpétuelle, the Garland, and Myrianthes. *Hybrid.* Astrolabe.

M. W.—Fuchsia corymbiflora has flowered well in the open air in this country. If planted in a warm border against a wall, we have no doubt it will succeed.

S. E. W.—We are making inquiries. Nothing can be well done with Asparagus beds now. Why not make new ones in the St. Sebastian way? The plant seems Sálvia involucrata.

T. T. H.—To ensure a good bloom of Campanula pyramidalis, you must keep up a constant succession of young plants, those which have once flowered in pots being only fit for planting out in the borders. You may propagate them by division of the roots, potting them in rich soil, and watering them plentifully with manure-water. The roots of your prickly Acacias may have penetrated into a wet subsoil, which, together with the great quantity of rain that has fallen during several seasons, may have filled the shoots with watery secretions, consequently the wood did not ripen sufficiently to endure the frosts of winter. We would train your Vines on the spur system, because by that means the plants growing under them will not be so much drawn up from want of light. You will find at p. 160 of this year a statement, taken from the "Carlisle Patriot," that Nitrate of Soda may be employed on Wheat as late as the beginning of May. In the note attached to that communication *never* is misprinted for *here*.

J. Murdoch inquires whether an Apple called the Cley Pippin is the same as the new Golden Pippin. He states that the original tree of the former was produced at Cley Hall, in Norfolk, by accident, between 30 and 40 years ago, and still exists, and though growing in a very unfavourable situation, viz. a boggy piece of ground under the shade of some large Ash and Elm trees, shows little tendency to canker, whereas Nonpareils contiguous to it are eaten up. He describes it as an abundant bearer, producing some years seven or eight bushels. Its fruit is so esteemed by his employer and his guests, that it is almost the only Apple eaten at his table. [The new Golden Pippin is different from the Cley Pippin, which is well known as an Apple of first-rate quality, and exists in the garden of the Horticultural Society.]

J. D.—The dimensions of your Vine-boxes must depend entirely upon the space which you can allow them in your greenhouse; the larger the better. Their depth should, if possible, be 2½ feet, and the compost should consist of good maiden loam, vegetable mould, well-decomposed manure, and bone dust, thoroughly mixed up together. Slate boxes will be preferable to wood, and by all means let them be the whole length of the house, placing a thin slate between each Vine to prevent the roots of one sort interfering with those of another. Any of the hardier varieties of Passiflora, Clematis Sieboldi or azúrea grandiflora, Kennédya monophylla, K. racemosa, Maurándya Barclayana, and various other climbers will thrive in such a situation.

A. G. N.—None of the species of Daphne require a rich soil, some preferring road sand to any other. The cause of your D. odorata not flowering is, therefore, owing to its being potted in too good a soil. Erythrina Crista-galli succeeds best in a warm atmosphere, with plenty of pot room, and mould of the richest quality. It will, however, flower abundantly in the summer if planted under a south wall.

Amateur, N. D.—You cannot water your Asparagus-beds with salt water at a better season than the present: it should be of the strength of sea-water. The following herbaceous perennials are suitable for beds on a lawn:—Pæonies, Gentians, Phloxes, Campanulas, Irises, Pentstemons, Œnotheras, Siberian and Barlow's Larkspur, Potentillas, Liliums, Lobelias, and Lupines. You may take the following Roses for standards:—Brennus, Riego, Bourbon Queen, Armosa, Lady Fordwick, Carminée carnée, à l'Odeur de Pâte d'Amande, Josephine Beauharnais, Harrisónii, Aubernon, Fulgorie, and Madame Laffarge.

Peter Simple.—The Mistletoe is generally propagated by inserting the seeds in crevices of the bark of trees (not under the bark), or by fixing the seed on the under side of a branch, to which it will readily adhere by its own viscosity. The failure you have experienced may be attributed to the barrenness of the seed, which although looking plump, is very often in this plant unfertilised. The Mistletoe has been grafted, as you will find by referring to Loudon's Gard. Mag., vol. xiii., pp. 206, 285; but as the month of May will be sufficiently soon for that operation, we will shortly revert to the subject.

M. W. H.—Your Camellia flowers were too far gone when they arrived to enable us to determine them correctly. However, No. 1 appears to be versícolor, and 3 myrtifólia.

W. Sim.—We will inquire if there is any work upon Chinese Agriculture.

Hibernia.—The following are some of the most handsome greenhouse annuals:—Brachycome iberidifólia, Schizanthus pinnatus, Nemóphila insignis, Rhodanthe Manglésii, Phlox Drummondi, and Clintónia pulchella. The Corræa speciosa major requires the protection of a greenhouse. We do not know the new fertiliser spoken of. Now is the best season to water Asparagus-beds with either sea-water or a solution of salt and water.

An Amateur Subscriber.—No wonder that you have no Grapes on your Vines. Two horses and ten pigs, flesh and all, buried in a Vine-border, form such a dose as no Vines ever had before. No doubt your wood was so strong, and grew so fast, that it would not ripen in the late cold wet season. If, however, you will take care to have the wood well ripened in good time this year, you will have plenty of Grapes hereafter; so that after all your horses and pigs will be turned to account.

F. Westcott.—The plant which you found growing in a cellar, and resembling many fine threads interwoven, is Racódium cellare.

W.—The small twig is, apparently, from the true "Knight's Monarch" Pear; but in order to be certain two fresh pieces would be desirable.

Mrs. Gason will find full directions for raising the seeds of Pines and Firs in an article in p. 83, col. c, of the present year.

If *A Reader* will turn to pp. 117 and 159, he will find that the Asparagus beds are half under salt water at spring tides.

Burnham.—No. 1 is Pinus nigricans; No. 2 is P. cephalónica. Do not prune Firs now. What *do* you mean by a *lusus naturæ* and a trap? We find nothing more than a Laurel-leaf with a bit of black Poplar pushed through it.

R. A.—Your seed is some Gourd unknown to us.

E. M. W.—We apprehend your Clianthus has been killed by cold. It will not bear so low a temperature as Camellias, especially if the soil in which it has been growing was wet.

A Wellwisher.—There is no such work as "Smith's British Botany." We presume you mean his "English Botany," which consists of 36 volumes, and between 2,000 and 3,000 coloured plates. A cheap edition of this is now in course of publication, and five or six volumes are out.

J. D.—The plants best adapted for the north side of your house are, Caprifólium gratum, Jasminum officinale, Clématis flámmula, and Periploca græca; to which you may add the following Roses:—Bougainville, Common China, Marie Leonida, and Rose de Lisle. A mixture of maiden loam and vegetable mould will suit them.

R. Mortlock's plant is Cestrum tomentosum.

An Aphis hater.—There is no known remedy for killing the Aphis which infests the Fir.

J. W.—The reason we do not insert such letters as Mr. ——'s literally is, that we do not consider them fit for publication in the form in which we receive them. We trust we act perfectly fairly by all men, but we should cease to do so if we permitted our columns to be a vehicle for abusive language. If people are aggrieved, they have two remedies—the one, not to address us; the other, to persuade other newspapers to print their letters verbally—if they can. We desire nothing better, but we must decline offending the good taste and good feeling of *our* readers.

J. Kyle.—One, p.m., is the latest hour at which subjects for exhibition are admitted into the Horticultural Society's rooms; where any person, whether a Fellow of the Society or not, is permitted to exhibit.

H. A.'s plant is a white variety of Scilla bifólia.

B. M.—Your specimen is a flower of Moræa tripétala; it is a native of the Cape of Good Hope, and requires to be potted in a mixture of three parts peat to one of loam and silver-sand. Place it in an airy part of the greenhouse, and water it freely until its flowers have withered. Then withhold water, and keep it dry until repotted in November.

Isabel.—Many thanks. The shilling has found its way into the pocket of a poor old applewoman, which we trust will meet your approbation.

C. M.—We have not yet succeeded in procuring the Trifólium giganteum—but *whenever* we do it shall be sent you.

Potentilla.—The Tree Fuchsias, Tree Veronicas, and Evergreen Beech, described by Capt. Fitzroy as clothing each side of the Straits of Magellan, have not been introduced into this country.

C. W. F.—Your plant appears to be a young pale specimen of a Lichen called Alectória jubata.

Hortulanus.—Your Heath is a variety of Erica Walkéria.

A Welsh Farmer's letter of inquiry is an advertisement.

J. B. is—a blockhead.

A Young Gardener.—Either your seed was bad, or you have not sown enough, or your soil is barren. Dress it with soot and have a little patience; or, which is better, give it a little nitrate of soda.

J. R. S.—We did not understand your suggestion about Roses to be a question, and therefore did not answer it. We have something of the kind in contemplation. Surely we must have replied to the inquiry about grafts if it was put; nurserymen do not sell scions. The Cineraria is a very good one, but so like others as to be undistinguishable by us.

A Subscriber shall have the information next week.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

We have little news from France beyond the proceedings of the Chambers and the affair of the Sugar Bill, which still continues to produce much excitement in the maritime towns. The Chambers have been occupied with the Ministerial estimates for the Military and Naval establishments, but their details present no interest to the general reader.—In Spain affairs have assumed so tranquil an aspect that the Ministry contemplate the disbanding of the army of the north, which was formed in consequence of the outbreak of October last. Some sensation has been produced by the announcement of a commercial treaty with this country, and an active opposition to the measure appears to be expected. The Minister of Finance has published his budget for the present year; it contains nothing which calls for particular notice except the increase of the expenditure, attributed to the recent troubles, and the remarkable omission of the ordinary allowance for the Church Establishment. Barcelona continues quiet, and the President of the late revolutionary Junta has been elected Deputy to the Cortes for the province by a large majority.—Our news from Portugal announces the birth of another Prince, and the increase of court intrigue against the Chartist Ministry. The formation of a National Guard has been decided on by the new Government on their own responsibility; the affairs of the country do not appear to be in any respect settled, and the Chartists are said to entertain ulterior designs, which render another outbreak by no means improbable.—Letters from Germany inform us that the Synod of Prussia persists in its opposition to the establishment of a Protestant Bishopric at Jerusalem in conjunction with this country, and that the proposed conversion of the Lutheran Church has given serious offence to the Prussian clergy.—From Belgium we learn that the trial of the prisoners charged with being concerned in the recent conspiracy at Brussels has been concluded, and that the four principal parties have been condemned to death; but no doubt is entertained that their lives will be spared.—The arrival of the Levant mail has supplied us with recent intelligence from Turkey, but it has not brought any further advices respecting the troubles either in Jerusalem or the Lebanon. The serious aspect of affairs in Syria has been the subject of discussion in several extraordinary councils of the Divan, and the official communications subsequently made to the different ambassadors are said to be satisfactory. A joint note has been addressed to the Porte by the representatives of England, France, and Russia, recommending the withdrawal of the Turkish troops from the Greek frontier; and it is expected that this suggestion will be complied with. Rumours of a change of ministry are current; and Omer Pacha, the Austrian renegade, has been recalled from the government of the Lebanon. We learn from Egypt that the Pacha having neglected to comply with the provisions of the Turkish treaty of commerce, abolishing all monopolies in the Ottoman empire, the British Consul has intimated to the merchants at Alexandria that they are not bound to accede to the new duties, and has also notified to the Pacha that the British Government will hold him responsible for the reimbursement of all sums already paid on account of those duties. — From the United States we have intelligence of some interest: the New York papers are occupied with the account of an affair similar to that of Mr. M'Leod—a British subject having been arrested within the American frontier, on the charge of having been concerned in the burning of the Caroline. He was immediately committed to prison, but was subsequently discharged by the Judge, in consequence of an informality in the warrant of arrest. The excitement occasioned by this event is said to have been considerable, and some fears prevailed that the populace would have proceeded to execute summary punishment on their prisoner. The answer of Lord Aberdeen to the final reply of Mr. Stevenson, the late Minister at this Court, on the question of the right of search, has been published in the American papers. It is regarded in New York as an important document, and will be read with interest. After meeting the leading arguments of Mr. Stevenson, his Lordship disavows all pretensions on the part of British cruisers to interfere with American vessels, whatever be their cargoes or destination; but declares that the British Government will never endure that the fraudulent assumption of the American flag shall extend the iniquity of the slave-trade to other nations which have entered into treaties with this country for the entire suppression of that traffic.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Windsor. Her Majesty has taken daily exercise during the week, and on Monday rode on horseback to the Great Park, to witness a hunt by Prince Albert's beagles. H.R.H. Prince Albert hunted with her Majesty's stag-hounds at the meet at Salthill on Wednesday. It is expected that the Queen and Court will leave Windsor for town on Saturday next. The first drawing-room for the season will take place at St. James's Palace, on Thursday, the 7th inst.; and the Lord Chamberlain has issued cards for her Majesty's first ball on Monday, the 11th, at Buckingham Palace. The Court, it is said, will pay a brief visit to Claremont about the end of May.—Lord Hawarden has been succeeded by the Earl of Warwick as the Lord in Waiting; Lady Charlemont has been succeeded by Lady Lyttelton as Lady in Waiting; and Sir F. Stovin by Sir R. Otway as the Groom in Waiting on her Majesty.

The Queen Dowager.—It is stated that her Majesty the Queen Dowager, although convalescent at the time of her return to Marlborough-house from Sudbury-hall, has found it necessary, from the delicate state of her health, to keep her chamber. Her Majesty, however, is said to have so much benefited by the late fine weather that she was enabled on Tuesday to come down stairs, and in the evening dined out of her chamber, for the first time since the severe pulmonary attack with which she was visited in November.

Official Appointments. — It has been announced that H.R.H. Prince Albert will be appointed by her Majesty Lord Warden of the Stannaries of Cornwall, vacant by the decease of the Marquis of Hertford.—At a Court of Directors of the East India Company on Wednesday, Col. Sir George Arthur, Bart., was appointed Governor of the Presidency of Bombay.—The Earl of Dalhousie is mentioned as likely to be appointed Governor of Madras.—It is stated that Lord Hill is about to resign his office into the hands of Sir G. Murray, and that Sir H. Hardinge will probably remove to the Ordnance-office. It is also rumoured that Lord F. Somerset will succeed Sir E. Blakeney in the command of the troops in Ireland, or be appointed Secretary-at-War, and that Sir B. Vere will be Military Secretary to the new Commander-in-Chief.—The Hon. Capt. Robert Bruce, Grenadier Guards, is appointed secretary to his brother, the Earl of Elgin, Governor-General of Jamaica.

Promotions. — It is announced that Lieut. Michael De Courcy, of the Charybdis, has been promoted to the rank of Commander; and it is understood that when he has served his time in that rank, the Lords Commissioners of the Admiralty intend still further to promote him to be Captain, on account of the great gallantry displayed by him in the late action with the Carthagenian squadron, an account of which was given in our last Number.—On Thursday the Lords of the Admiralty promoted Mr. Waghorn to the rank of Lieutenant in the Royal Navy, an appointment which is understood to be intended as an official acknowledgment of Mr. Waghorn's exertions in establishing the overland route to India.

Parliamentary Movements.—Mr. Summers Harford, late Member for Lewes, has announced himself a candidate, on the Whig interest, for the representation of Brighton.—Mr. Chalmers has retired from the representation of the Montrose Burghs, in consequence of continued indisposition. Mr. D. Wemyss Jobson has come forward as a candidate; and Mr. Joseph Hume is also spoken of.

Post-Office.—On Thursday a new order of the Postmaster-General came into operation, respecting the transmission of the Hamburgh mails, which will for the future be made up on Tuesday and Friday nights, at half-past eleven, and despatched immediately after by contract steamers.

Foreign.

France.—*The Sugar Question.*—The journals this week are unusually destitute of news, and contain little intelligence of importance. The approaching dissolution of the Chambers and the Sugar question are the principal topics which they refer to. The latter subject continues chiefly to occupy public attention, and is warmly discussed by the Paris papers. The Chamber of Deputies assembled on Saturday in its standing committees for the purpose of examining the project of law on this subject presented, as reported in our last, by M. Humann, Minister of Finance, and having for its object to maintain in force the existing law relative to colonial and beet-root sugars. The question gave rise to an animated discussion; and the following is an abstract of the opinions expressed on the subject:—M. Muret de Bord thought that the colonial sugar-cane, which contained twenty parts of sugar, of which but five were extracted, must ultimately prevail over beet-root, which contained but ten parts of sugar, of which six were already extracted. He was for equality of duties. The three councils of agriculture, commerce, and industry had, he said, rejected the suppression of indigenous sugar; and such difference prevailed, that it was no wonder if Ministers adjourned the question. M. Lanyer urged that the French colonies could at best only furnish two-thirds of the 120 millions of kilograms of sugar at present required for the consumption of the country. The councils, he said, had declared against indemnity and interdiction, but that was all. M. Ducos, member for Bordeaux, complained that French shipping was excluded from all but colonial ports, and yet were obliged to return even from these in ballast, the price of sugar being so low. In such a state of things, he was of opinion that to do nothing was to sacrifice every interest of the country. M. Luneau said that the promise of indemnity had lured the beet-root sugar manufacturers to continue working, which had overloaded the market. M. Lefebvre said the difficulty lay in the 25,000,000f. lost annually to the Treasury by beet-root, and in the 3,000 sailors that would be employed in the import of foreign sugar, were beet-root suppressed. The Minister of Commerce, M. Cunin Gridaine, said that the Chamber was not prepared to vote the only remedy, the suppression of beet-root sugar; nor could the law now be passed till the beet of the year was seen. It was, therefore, too late this year. Ultimately, after a long and warm debate, the Ministry succeeded in returning seven of the nine commissioners to whom the Bill was to be referred for special examination. The excitement in the outports occasioned by the postponement of this question is stated to be on the increase; and the Chambers of Commerce of Marseilles, St. Malo, and other maritime towns, have sent in their resignation, in addition to those of Bordeaux, Havre, Nantes, and Dunkirk, mentioned in our last.

The Chambers and the Budget.—On Tuesday the monthly assortment of the bureaus took place, which were as favourable to the Ministry as in preceding months. The commission of the budget heard on Monday the explanations of the Ministers of War, Foreign Affairs, and Marine. Marshal Soult gave explanations relating to his department, which is divided into three sections—the home service, Algeria, and extraordinary works. The two first, which comprehend the expenses of the army, give a total of 295,909,733fr., for 344,000 men, and 84,288 horses. To effect the lately-proposed reductions, a company for every battalion will be taken away from each regiment of the line and of light infantry. In addition, 100,000 men will pass into the reserve in 1843, and a reduction of 13,395 horses will be gradually effected. Marshal Soult showed that these measures will produce a saving of 32,656,892fr., but the total diminution only reaches 29,893,242fr., in consequence of several augmentations, which will require a sum of 2,763,650fr. These augmentations are intended to give a supplement to the pay of the troops in garrison in Paris and the banlieue. The Minister also demanded several large sums for increasing the number of officers in the new staff arrangements; for the general inspection of gendarmerie; for expenses of the reserve; for allowing a higher price for horses; for increase of charges in the transport of baggage; and for some changes in the home service. A discussion arose on each of these points, and several of the items were reserved, notwithstanding the arguments of the Marshal. The budget for the Marine, divided into two sections, amounts to 98,763,026fr., including 4,440,000fr. for extraordinary works already authorised, and 2,400,000fr. for the construction of transatlantic packet-boats. Putting aside these two charges, both temporary, the budget for the Marine amounts to 91,923,026fr. The committee was unanimously of opinion that no reduction was required in this part of the budget.

The Press.—It has been resolved at a meeting of the editors of the Parisian press, that at the ensuing elections each journal shall have its candidate at some electoral college; and it is stated that on the eve of the elections a joint protest will be addressed to the nation against the prosecutions of the Government. The "Charivari" having promised to appear on Sunday with an article entitled "Easter Eggs," M. Levy, the printer of the publication, who is now under sentence of the Court of Assizes for a seditious libel, referred to in a previous Number, refused to print the number, on the ground of the article exposing him to another indictment. The question was brought, on the complaint of the proprietors, before the Civil Tribunal; but the President declined to interfere. M. Levy, it appears, then consented to print it under protest, the editor and the responsible publisher signing the number.

The Navy.—An announcement has appeared in a Toulon journal which seems to be regarded as a proof that the Government is seriously occupied with the long-promised disarmament. The journal in question, under date the 24th ult., states that a despatch from the Minister of Marine reached the maritime authorities of Toulon on the 22d ult., enjoining them to dismiss immediately all the seamen of the fleet who had served during 36 months on board the ships of war—a decision which, it is said, produced a painful sensation in the harbour, where it is generally considered to be the prelude of the disarmament of a considerable portion of the naval forces. Private letters from Toulon of the 23d inst. state that the Belle Poule frigate is gone out of harbour, with orders to get ready for sea by the beginning of May, at which period the Prince de Joinville will resume the command of her, and proceed on his voyage of circumnavigation. The newly-appointed Major-General of Marine, Rear-Admiral Gaulthier, entered on his functions at Toulon, on the 20th ult.

The Capital.—The Opposition papers express dissatisfaction at the increased solemnity with which Good Friday had been observed in the capital. So far from commending this improvement, these journals complain that for the first time since the revolution of 1830, the minor theatres were kept closed by an "invitation" from the Commissaries of Police, and the soldiers of the garrison were excused military duty, in order to enable them to go to church. The weather had again become fine and mild in Paris. The journals announce that prayers ordered by the Archbishop of Paris for the protection of the Catholic religion in Spain commenced in all the churches of the diocese on Easter Sunday. It is reported that the Prince de Joinville is about to espouse a Dutch Princess; and that the King of Holland has sent a Dutch order to the young prince: but other accounts deny the authenticity of the rumour.

Algeria.—Intelligence has been received from Algiers to the 20th Feb. The Governor-General continued to receive propositions of peace from the different tribes which had hitherto held out for Abd-el-Kader. On the 17th Feb. Gen. Changarnier returned to Blidah from an incursion on the territory of the Hadjoutes, bringing with him 480 prisoners and 3,000 head of cattle.

Spain.—Our accounts from Madrid are not of great interest. The alarm created by the late expected outbreak on the frontier seemed to be fast subsiding; and it was reported that Government contemplated disbanding the army of the north, which was formed subsequently to the events of last October. The sittings in both Chambers offer little matter of interest. The announcement recently made in the House of Commons by Sir R. Peel, respecting the negotiation of a commercial treaty between Great Britain and Spain, appears to have caused considerable sensation in Madrid. The Catalonian Deputies had taken alarm in consequence, and were to meet in the evening of the 21st ult., to decide on the course they should pursue, and it was expected that they would publicly call on Ministers to declare if there was any truth in the statement made by the English Minister. The Minister of Finance presented to the Chamber on the 19th ult. the budget for 1842. The expenditure for that year amounts to 1,369,300,000 reals, which, as compared with the budget of last year, shows an increase of 41,226,000 reals. There is no allowance made in the returns for the maintenance of the clergy or ecclesiastical affairs. The Queen, it seems, has refused to allow the keys and other insignia of his office, as nobleman of her bed-chamber, to be given to Col. Dolce, the chief of the Halberdiers who so bravely defended the royal palace during the night of the 7th Oct. The reasons, however, for this refusal on the part of her Majesty are not stated. It was rumoured in Madrid that M. Gonzales entertained the project of marrying the Queen to the Emperor of Brazil, with a view to unite Portugal and Spain under the same crown. Queen Donna Maria, the report adds, would obtain in exchange the empire of Brazil; and Spain would, moreover, make over to her Majesty all her claims to the possession of her former American colonies. Gen. Darbo had been appointed Capt.-General of the Canary Islands, and it was believed that the present Minister of War, Gen. Cambo, would shortly supersede Gen. Oraa in the government of the Philippine Islands; in which case Gen. Capaz, it is said, would be nominated Minister of War. It appears that the religious ceremonies of the Holy Week were about to be celebrated with unusual éclat and solemnity; and the Regent, by a decree of the 2d ult., had ordered the provincial deputations to place funds for that purpose at the disposal of the clergy. At Seville 70,000 reals had been awarded, and the authorities of Toledo were making great preparations for the celebration of those religious festivities, in the hope of attracting thither a considerable affluence of strangers.—The Barcelona journals, which have been received to the 19th ult., inform us that the *progresista* candidate, M. Antonio de Llinas, President of the late Junta of Vigilance, had been elected Deputy to the Cortes for the province by 2,400 votes. The rebel chief Felipe was believed to have escaped into France. A Spanish frigate and brig have arrived at Barcelona to watch the proceedings of a French squadron which, it seems, is at anchor there, composed of a frigate, a steamer, and two brigs. Gen. Rodil, after inspecting the military stations of the Basque provinces, was at Bilbao. The journals announce the discovery of a gold mine in the neighbourhood of Saceda Tras Sierra, and of two other mines, supposed to be of quicksilver, in the district of Huete.

Portugal.—Intelligence has been received from Lisbon announcing that the Queen was safely delivered of a

Prince on the 16th ult., and that both were doing well. A French line-of-battle ship and frigate arrived at Lisbon on the 17th ult. The journals state that the Ministry yet remained incomplete, and that the intrigues at Court against them were very great. The Duke of Terceira and his colleagues have resolved on a measure which was considered likely to strengthen them, if at once carried out, viz., the formation of a National Guard, officered by military men appointed by the Crown. The royal assent had been obtained; the Ministry declaring that, though the act went beyond their powers, they took on themselves all the responsibility, and should apply to the Cortes for a bill of indemnity. Baron Tojal would obtain 500 to 600 contos more than his predecessor by the loan now agreed upon. The King has refused to take the command of the army. The question of forming the Chamber of Peers and filling up the vacancies in the Council of State were matters that were expected to be soon decided. The people in the north of the country are, it seems, complaining greatly of the stagnation in the wine trade, there being at present no less than 270,000 pipes in store; and some anxiety is expressed for the conclusion of a treaty with England. A communication had been received from Vienna from the Marquis of Saldanha, stating that he had been well received by Prince Metternich, and that the latter had declared to him that the Austrian Government was gratified at the change from the constitution to the charter, and could hardly credit that the Crown and the diplomatic body should have opposed it. The news had arrived through the public papers, and seems to want confirmation. It is also stated that Lord Aberdeen has stated that he is satisfied with the result arrived at, and has expressed his hope that the charter will be firmly maintained.

GERMANY.—Accounts received from Vienna of the 17th ult. mention a report that Baron Nieumann, the Austrian Envoy Extraordinary in London, is to be the Minister at Florence, and the Count de Colloredo, the Austrian Envoy at Munich, to be the Ambassador in London. The same accounts add, that the Portuguese Ambassador, the Marquis de Saldanha, was treated at the Court of Vienna as an "Ambassador de Famille," and had already paid his respects to the Duchess of Saxe Coburg Cohary, mother of King Ferdinand. It was not thought that he would proceed to London before the month of May. Prince Milosch had taken a house in Vienna, and was expected to remain there for some time. A severe storm at the mouth of the Danube has destroyed all the quarantine establishments, and done much damage. Private letters announce that Baron Bulow, now ambassador to the German Diet, will be the Minister for Foreign Affairs. M. de Werther at present replaces the Minister. *ad interim* M. de Maltzan. Letters dated Berlin, 19th ult., mention that the Synod of Prussia persisted in its opposition to the establishment of an evangelical Bishopric at Jerusalem in conjunction with England. It is reported in the higher circles that the two royal houses of Prussia and Hanover contemplate a further alliance with the ducal house of Dessau, which is nearly related to both of them, by the intended betrothing of the Crown Prince of Hanover to the Princess Agnes of Anhalt Dessau, who is at present at Berlin. The papers state that eight out of 27 Anabaptists who lately caused themselves to be baptised a second time in the lake of Rummelsburg, on an intensely cold day, have been taken ill, and that three of them have already died. It is also added that Government intends to prohibit, under the severest penalties, all baptism by immersion, without a special permission from the local ecclesiastical authorities.

BELGIUM.—Our accounts from Brussels inform us that the trial of the prisoners charged with being concerned in the recent conspiracy, noticed in former Numbers, has been concluded. The pleadings and examination of witnesses, which lasted a considerable time, terminated on the 25th ult., when the verdict of the jury was delivered, and the sentence of the Court passed. The jury acquitted MM. Parys, J. Vandersmissen, Parent, and Madame Vandersmissen, but declared the other prisoners guilty—viz., Gen. Vandermeere, Gen. Vandersmissen, and Crehen, of conspiracy against the State, but applying to Crehen the benefit of the article of the penal code in favour of persons guilty of conspiracy, but making disclosures calculated to prevent its execution; Van Laethem and Verpraet were declared guilty of attempts to seduce soldiers and others into rebellion. The Court having deliberated on the sentence, announced that it had joined itself to the majority of the jury, and the President ordered the discharge of the prisoners in whose favour a verdict of acquittal had been returned, and invited them to retire. Madame Vandersmissen, however, whose grief was very great, exclaimed that she would never quit her husband, and threw herself into his arms, and the President and her husband both in vain implored her to retire. Gen. Vandersmissen consequently entreated the President to allow his wife to remain, and the request was granted. The Court then pronounced sentence of death upon Vandermeere, Vandersmissen, Van Laethem, and Verpraet, the costs of the trial to be paid by them, and the execution to take place in one of the public places of Brussels. The Court decided in favour of Crehen, and ordered him to be set at liberty. When sentence of death was pronounced upon Gen. Vandersmissen and the others, Madame Vandersmissen, it is said, uttered cries which produced a painful impression upon all present; she afterwards accompanied her husband on his return to prison, and remained with him until a late hour. Gen. Vandermeere was also permitted to receive his sister, and the other prisoners were visited by their near relatives. The journals announce that the four persons condemned to death have given notice of an appeal to the Court of Cassation, and express a confident opinion that, whatever may be the result of their appeal, the King will exercise the prerogative of mercy in their favour. It may interest our readers to learn that the wife of Gen. Vandersmissen is an English lady, being a daughter of the late Admiral Sir Richard Graves. She is said to possess great political enthusiasm, and during the General's escape from Antwerp to Aix-la-Chapelle, on the occasion of his abortive plot in 1831, she went through adventures as romantic, it is said, as some of those that have signalised the Duchess de Berri. The lady of Gen. Vandermeere is likewise an English, or rather an Irish lady, well known to the fashionable world as Miss Emma Drummond.

SWITZERLAND.—The Geneva journals state, that from the surveys and soundings of the Rhone from that city to the extremity of the canton, it has been ascertained that there are no serious obstacles to rendering it so far navigable. They add that there will be some rocks to blow up, some rapids to smooth, and some cuttings to be made to avoid shallows and sudden turns: but that all these may be accomplished without great difficulty; so that when the French Government shall have overcome that of the fall of the Rhone, the whole passage from France to Geneva may be opened.

ITALY.—Accounts from Rome, of the 17th ult., state that a good understanding now prevails between the Court of Lisbon and the Holy See; and that a courier was despatched on the 15th ult. with instructions for Monsignor Cappaccini, the Nuncio in Portugal, carrying with him the Golden Rose, which the Pope consecrates every year, on the fourth Sunday in Lent, in order to be presented to some prelate of distinction. It was believed that several new cardinals would be appointed after Easter. Some disturbances had occurred at Bologna. They do not seem, however, to have been of a political nature, and the authorities easily repressed them. The Swedish Count de Pahlen was found murdered in his palace on the 16th ult. He had retired for some time from political life, and was engaged in putting in order a quantity of materials which he had collected in his journey through Greece, Egypt, and the East. The murderers carried off a valuable collection of antiquities, which are supposed to have been the incentive that prompted them to the commission of the crime. The Count was 80 years of age.

RUSSIA.—Private letters from St. Petersburgh, received by way of Berlin, state that the report mentioned in a previous Number of this Paper, but to which little credit was attached at the time, respecting the mutiny of a regiment at St. Petersburg, is in its main statement correct, and give the following details of the affair: "The Emperor, it is said, hastened in person to the barracks of the regiment which had mutinied, and had nearly succeeded in bringing the men back to a sense of their duty; he represented to them in impressive terms the criminality of their proceedings, when an officer stepped forward to seize him. His Majesty killed the rebel and withdrew, seeing that there were no hopes of prevailing by milder means on the misled soldiers. The barracks were immediately attacked; a great part of the rebels fell with arms in their hands, and the rest were sent to Siberia the same day.—Accounts from St. Petersburg of the 5th ult. state that the mountaineers have availed themselves of the present mild winter to make continued incursions on the Russian territory on the side of the Cuban and the Caucasus. Early in January a party, 8,000 in number, rode from one of their settlements in the mountains, a distance of 200 wersts, and attacked the town and fortress of Kisljar, in the province of Caucasia. The garrison of Kisljar had been transferred to another destination, and only a few men remained in possession of the place. The inhabitants were plundered, and many of them carried away in captivity; several houses were burnt to the ground, and the whole town nearly destroyed.

DENMARK.—Accounts from Copenhagen, of the 11th ult., give the answer of the King to the recent application of the committee for paying off the national debt, noticed in a previous Number. It is as follows: "His Majesty accepts with great satisfaction the patriotic offer which has been made to him, and authorises the formation of a committee to receive subscriptions for paying off the national debt, in the capital and the provinces, including the duchies of Sleswick and Holstein. The funds arising from these subscriptions shall be paid over to the directors of the public debt and sinking fund, to be hereafter applied as may be deemed advisable. The directors shall be held responsible for their employment of these funds, and shall render their operations public by means of the press. His Majesty further declares that, although the sums annually laid aside for clearing off the national debt appear to him to be sufficient for the purpose, yet he feels great pleasure in seconding the patriotic intentions of his subjects."

GREECE.—Our intelligence from Athens is not important. The Government, it seems, had, as was before reported, despatched troops to the Turkish frontiers on hearing of the Porte's preparations on their side: and it is positively said that the number of all the Greek troops now assembling there will amount to about 10,000 men. The business of the new bank at Athens was proceeding very slowly. The French Rear-Admiral Lasusse anchored in the Bay of Salamis on the 9th ult. with four ships of the line and two frigates.

THE IONIAN ISLANDS.—The Ionian Parliament opened at Corfu on the 1st ult., and on the 3d the new Lord High Commissioner delivered his speech. The finances he admitted to be much involved, the expenditure having exceeded the revenue. He mentions various reductions to relieve the debt of upwards of 150,000*l.*, and demands the authorisation to sell all public property of every kind, and to put an end to the grain department, and to leave the trade in wheat free, like that in all other kinds of grain. The President of the Legislative Assembly, in reply, stated that the address of his Excellency was full of flattering hopes, and the Chamber would cheerfully cooperate in any measure for the advantage of the people.

TURKEY.—By the arrival of the Levant mail we have received intelligence from Constantinople to the 7th ult. There was no news confirming the reports of the serious troubles stated to have taken place either in Jerusalem or Syria. The Divan had held several extraordinary councils towards the close of Feb., on the receipt of despatches brought from Syria. The last, which took place on the 27th of that month, lasted several hours, and was attended only by the Ministers and Imperial dignitaries of the first rank. The resolutions of the assembly were not known, but it was said that the communications subsequently made by the Grand Vizier to the different legations were of a satisfactory nature. A British steamer left Constantinople for Syria on the 6th ult. It was said that the son or a relative of Emir Beschir had been appointed governor of the Lebanon in the room of Omar Pacha. This report, however, was deemed to require confirmation. M. Mavrocordato, the new Greek Ambassador, arrived at Constantinople on the 2d ult. He had presented his credentials, but up to the 7th ult. had not been received by the Sultan. The representatives of England, France, and Russia have addressed a note to the Porte, recommending the withdrawal of the Turkish troops from the Greek frontiers; and the Divan, it is added, displayed every disposition to comply with the suggestion. The prospect, however, of an immediate settlement of the dispute between the two countries is said to be again delayed in consequence of M. Mavrocordato having departed from the basis laid down by Sir S. Canning on his Excellency's departure from Athens, and raised fresh pretensions. Rumours were still afloat in Constantinople of a change of Ministry; and it was not expected that Izzet Mehemet Pacha would much longer continue in office. A difference, it appears, exists between the Porte and France on the subject of the new Consuls of the latter power. S. Botta, a son of the Italian historian, has been named Consul at Mossul in Mesopotamia; but the Porte refuses to sanction the appointment, on the ground that the French have no commercial interests whatever at Mossul, but merely religious ones, which they want to take advantage of. The Porte has prohibited the sale of gunpowder, manufactured at Galata and Pera, and addressed an official note to all the legations, inviting them to direct their respective countrymen to abstain hereafter from importing or selling that article in the Ottoman dominions, and to deposit in the stores of the war department the gunpowder they may have in their possession. Said Pacha had been removed from the post of Governor of Smyrna for acts of cruelty committed on some of the inhabitants, on the complaint of Sir S. Canning, but has since been appointed to the Pachalic of Constantinople.

EGYPT.—The news brought by the Levant Mail from Alexandria extends to the 6th ult. We learn that Mehemet Ali unexpectedly returned to Cairo on the 23rd Feb. It appears that his health was beginning to be impaired by the fatigues attendant on his journey in Upper Egypt, but the last accounts from Cairo mentioned that he was completely recovered. The Pacha, having failed to comply with the provisions of the treaty of commerce of 1838 with Turkey, abolishing all monopolies in the Ottoman empire, the Consul, Mr. Stoddart, has addressed a circular to the British merchants at Alexandria, dated the 5th ult., intimating that they were not bound to pay the two per cent. attempted to be levied upon imports in virtue of the first additional article of that treaty. The Consul-General had also signified to Mehemet Ali that the British Government would hold him responsible for the reimbursements of all such sums as may already have been paid on account of the above duty. The Austrian Consul-General has concurred in the notice. Sami Pacha left Alexandria on the 5th ult. for Constantinople in the Nile steamer, to arrange some misunderstanding with the Porte on the tribute accounts. The Pacha had abolished the wine, spirits, and skin monopolies, and permitted the caravans of Darfur, Djedda, and other countries, to bring their goods, as formerly, to the market of Cairo. Only four cases of plague and two deaths had occurred at Alexandria since the beginning of March.

UNITED STATES.—By the packet ships Patrick Henry and Sheffield, which have arrived at Liverpool, we have New York papers to the 15th ult. They are all occupied at some length with an account of what they term "another M'Leod affair," which appears to have produced a good deal of excitement in New York. It appears that a man named John Sheridan Hogan, a native of Ireland, but a resident of Upper Canada, had been arrested at Lockport, the place where Mr. M'Leod was arrested, on a charge of his having participated in the burning of the Caroline steamer, and taken before a police justice of the village. The justice, however, refused to interfere. Hogan was, notwithstanding, sent to gaol, and was carried on the following morning on a writ of *habeas corpus* before Judge Ransom. It was reported at first that he had escaped from prison, but it appears that after a long argument before the judge, he was discharged, on the ground of some legal insufficiency in the warrant. The President has since sent a message to Congress urging the necessity of giving the jurisdiction in all such cases to the general Government. Whilst the excitement caused by the arrest of Hogan was at its height, the citizens of Lockport discovered that the commander of the party which had burned the Caroline, Sir Allan M'Nab, had actually passed through the state on his way to embark for England. A Lockport paper says that upwards of 100 of the citizens immediately turned out, mounted horses, and put out on the road to Albany, in the hope of overtaking him. This, however, they did not succeed in doing, and Sir Allan is now safely in London.—The proceedings in Congress present no feature of interest for the English reader. Mr. Clay had resigned his seat as Senator of Kentucky, and was to be succeeded by the Hon. J. J. Crittenden.—Lord Aberdeen's reply to the final note of Mr. Stevenson, late American Minister in London, upon the right of search, though not published by the American Government, has been privately circulated among the members of Congress, and is given in the New York papers. It is a State paper of considerable interest and importance; and in it Lord Aberdeen distinctly removes all pretence for any future misrepresentation of the grounds of the difference between the two Governments. Mr. Stevenson having persisted to the last in maintaining, "that the British Government assert a right which is equivalent to the claim of searching American vessels in time of peace," and having referred in support of this construction to some passages in a note of Lord Palmerston to himself, Lord Aberdeen begins by disclaiming all responsibility for any expressions used by his predecessor. "The undersigned," he says, "must request that his doctrines upon this subject, and those of the Government of which he is the organ, may be judged of exclusively from his own declarations." He then explicitly repeats his former renunciation, on the part of this country, of all claim to a right of search over American vessels in time of peace. He explains the difference between a right of search, which, he says, "is not confined to the verification of the nationality of the vessel, but also extends to the object of the voyage and the nature of the cargo," and the right of ascertaining, by the only possible means, the essential fact of nationality, upon which the conduct to be observed towards foreign vessels must in every case depend. As to the former, he observes that, when a vessel is once ascertained to be American, the British cruisers are ordered to abstain from all interference with her, "be she slaver or otherwise;" while, as to the latter, he asserts that to deny it, is to make the mere assumption of the American flag a protection to every piratical enterprise. On this point of the subject, Mr. Stevenson had, it seems, "declared that, in denying the right of interfering with vessels under the American flag, he intended to limit his objections to vessels *boná fide* American, and not to those belonging to nations who might fraudulently have assumed the flag of the United States." "How," Lord Aberdeen asks in reply, "is this *bona fides* to be proved? Must not Mr. Stevenson either be prepared to maintain that the flag alone is sufficient evidence of the nationality of the vessel, which, in the face of his own repeated admissions, he cannot do; or must he not confess that the application of his arguments would really afford protection to every lawless and piratical enterprise?" The remainder of the note is chiefly occupied in an indirect but powerful appeal to the generosity and honour of the American nation, to act up to their professed abhorrence of the slave-trade, and take "their proper place among the great Powers of Christendom, foremost in power, wealth, and civilisation, and connected together in the cause of mercy and justice," for the suppression of that odious traffic. If such considerations fail, Lord Aberdeen desires to repeat, "that with American vessels, whatever be their destination, British cruisers have no pretension in any manner to interfere. Such vessels must be permitted, if engaged in it, to enjoy a monopoly of this unhallowed trade; but the British Government will never endure that the fradulent use of the American flag shall extend the iniquity to other nations, by whom it is abhorred, and who have entered into solemn treaties with this country for its entire suppression."—The Resumption Bill had not passed the Legislature of Pennsylvania. A conference was holding respecting it; and apprehensions were expressed lest it should, after all, be rejected. The banks, meanwhile, were preparing to meet the requirements of the bill, should it pass the Legislature. Mr. Charles Dickens, his wife having recovered, had left Philadelphia for Washington. The Senate of the state of Florida had passed resolutions declaratory of the right of the state to repudiate all debts or engagements made by parties not legally authorised by it.

Canada.—The accounts brought by the "Patrick Henry" include dates from Toronto, Upper Canada, to the 23rd Feb. It is stated in private letters that the winter had proved an extraordinary one. Scarcely any frost or snow had occurred, and the roads were in consequence impracticable. In some parts of the west ploughing had commenced: but this was not considered favourable to the farmer, as there was no possibility of getting his produce to market. Sir C. Bagot was not expected to call the Legislative Assembly together till the latest period prescribed by the law, namely, the autumn.—Great importance appears to be attached to an agricultural petition forwarded to England to be submitted to her Majesty and to both Houses of Parliament, and which will, it is understood, be advocated by all the interest the Governor and Directors of the Canada Company can command. The object of the petitioners is to get Canadian corn and flour admitted to consumption at a nominal duty, and to procure the imposition of a protective duty on American corn brought into Canada, which is now ground into flour and sent to England as Canadian. It is stated that 16,000 signatures were procured to the petition in the course of a single day, and that, had time for the purpose been given, it would soon have been extended to 100,000.

Peru and Mexico.—Advices from Lima, dated 18th Dec., report that Gen. Ballevian, at the head of the Bolivian army, had entirely routed the Peruvian troops, under President Gamarra, who was killed in the conflict. The battle took place in November near La Paz. Subsequent accounts received from Bolivia confirm the above report of the action, and give some further details; they add that the engagement took place at Ingavi, some five or six leagues from the city of La Paz, when, after an obstinate contest, victory declared for the Bolivians. Gamarra, as stated above, was left dead on the field, with about 500 of his troops; and the second in command, Gen. Castilla, with a considerable number of officers, and upwards of 3,000 troops, were taken prisoners. The whole army of Gamarra was, in fact, annihilated, for before the action it only consisted of some 5,000 men, whilst that of Gen. Ballevian is stated not to have exceeded 3,700. The Bolivians fought with the most determined valour, and were the first to make the attack. After the battle the Bolivians were said to be marching upon Arequipa, so as to carry the war into Lower Peru, unless an accommodation should be agreed upon.—New Orleans papers of the 24th of February state, that the Captain of a schooner, seven days from Matamoras, had reported, that as he was about leaving that city an express arrived, stating that a body of about 500 Mexicans had crossed over into Texas, and fallen in with a Texan force, when, after a short engagement, the Mexicans were completely routed. Such was the slaughter reported, that but two Mexicans are said to have escaped with their lives. The particulars of the engagement are not given.

Australia.—Intelligence from Australia has been received to a recent date. A serious affray had occurred at Sidney between the police and part of the crew of her Majesty's ship Favourite, which was quelled only by the intervention of the military, who were obliged to fire ball, but over the heads of the populace. No loss of life took place, but many were wounded. At Hobart Town, on the 28th Oct. a Government notice had appeared, requesting information as to the number of servants who could find employment in the colony. The object was to endeavour to make arrangements, in conjunction with the immigration committee, for a supply of good and efficient labourers. Over-trading had apparently come to an end at Launceston; the number of insolvencies, principally attributed to this cause, had been from the 1st Jan. 1840, to the 13th Sept. 1841, eighty-four, with debts amounting to nearly 150,000*l.*, and assets not sufficient to pay, on the average, one-fourth.

CITY.

Money Market, Friday.—The prices of the English funds left off firm, notwithstanding money was a good deal in demand. Consols for money were finally quoted 90 to ⅛ buyers; for the account, 90⅛ to ¼ buyers; Exchequer-bills, 31s. to 33s. premium; India Bonds 9s. to 11s. premium; and New Three-and-a-Half per Cents., 99⅜ to ½.

Metropolis and its Vicinity.

The Easter Holidays.—The different national exhibitions in the Metropolis have, as usual during Easter week, been numerously attended by visitors. At the British Museum the company has been unusually great. On Monday there were 14,320, on Tuesday 2,575, and on Wednesday 3,285; being an increase in the numbers each day over last year, when the visitors on Easter Monday were 13,351, Tuesday 1,694, and Wednesday 2,129. On last Whit Monday there were 9,031. An extra police force was in attendance, but no disorder occurred, nor any case requiring their interference. At the different exhibitions, as well as the Tower and the National Gallery, the visitors also have been very numerous; and at the latter place it is computed that there were upwards of 13,000 persons on Monday, and 10,000 on Tuesday; and considerable numbers on the subsequent days of the week. The fairs in the vicinity of the Metropolis, at Greenwich and Primrose Hill, have also proved, as usual, a source of attraction to thousands of persons; and the fineness of the weather at the early part of the week caused them to be numerously attended. An account of the theatres, and the Easter novelties produced at those places of amusement, will be found in another part of our Paper.

Banquet at the Mansion House.—The Lord Mayor gave the customary Easter banquet at the Mansion House on Monday, to about two hundred and fifty guests. The entertainment was on the usual scale of splendour. Lord Wharncliffe, Lord Fitzgerald, Lord Denman, the Bishop of Salisbury, Chevalier Bunsen, Lord Dudley Stuart, and several members of Parliament, were among the guests. The proceedings of the evening differed in no respect from the ordinary routine on such occasions; the usual complimentary toasts were proposed, and that in honour of the Government was acknowledged by Lord Wharncliffe. The only topic which seems to call for particular notice was the speech of Chevalier Bunsen, after the health of the King of Prussia had been drunk. In allusion to the recent visit of the King to this country, he said that he had come over at the request of the beloved sovereign of these realms, who combined all the amiable qualities which were at once an ornament to her sex and the glory of her crown. The occasion was interesting to this country, and the cordiality with which his Majesty had been received, not merely as a royal guest, but as the guest of the nation, must ever be gratifying to him. Since his return to Prussia His Majesty had intimated to him the peculiar gratification which he had experienced during his stay in this metropolis; and he felt greatly honoured in expressing these his Majesty's feelings, in the Palace of the Lord Mayor, where he had partaken so largely of his Lordship's kind hospitality.

Metropolitan Improvements.—It is stated that the Board of Works have agreed to carry into effect the projected improvements on the south side of Piccadilly, by widening the public road twenty feet, from Hyde Park-corner to the ground opposite Devonshire House, and erecting a terrace along the whole line; on condition, however, that the parish keep the whole in repair. The ground is to be taken from the Green Park, and the two lodges, one where the late Ranger's lodge stood, and the other opposite the basin, are to be removed forthwith. Numerous workmen have lately been employed in planting oak and elm trees in the vacant ground opposite the statue of Achilles, in Hyde Park.—Mr. Wyatt's colossal group of the Duke of Wellington on his horse Copenhagen, intended to surmount the arch at the Hyde Park-corner entrance to the Royal Palace, is announced as completed; and nothing remains but the casting it in bronze. The statue is about four times the size of life, being twenty-seven feet in height, and is said to be the largest monument of the kind ever modelled. The duke, habited in a costume similar to that he wore on the field of Waterloo, is represented extending his right hand, and pointing with his glass, at the moment when, turning to Lord Hill, he signified the approach of the Prussians at the close of the battle, and proceeded to give the order for the general charge. The likeness of the Duke is described as good, and the horse, a portrait of his celebrated charger, is said to be well proportioned. This statue will be placed, as soon as the casting is completed, on the arch at Hyde Park-corner, nearly in front of Apsley House, and will stand at an elevation of 80 feet from the ground. The head and legs of the figure are already cast from the metal of a piece of ordnance taken at Waterloo.

The Tower.—On Saturday the Crown jewels and regalia were removed from the custody of Messrs. Rundell and Bridge, where they have been deposited since the late destruction of the grand armoury by fire, in order that they might be placed in the apartment fitted up for their reception in the new Jewel House, which was opened on Monday to the public. They were removed in three hackney-coaches, under the care of the yeoman porter and warders of the Tower. On their arrival at the fortress they were taken to the new Jewel Office, and arranged by Mr. Swifte, the keeper of the jewels, under the personal superintendence of Earl Delawarr, the Lord Chamberlain, who visited the Tower for that purpose. The number of persons who paid for admission to view the regalia and the ruins of the small armouries during the week has been very considerable. The sale of the relies of the late fire still continues; and though it had been for some time previous very dull, it revived during the past week, and has again produced a considerable sum of money.

Metropolitan Antiquities.—A singular discovery of ancient coins was made on Wednesday, on the banks of the river near Lambeth. It appears that a young lad, while employed digging up the mud, was attracted by some shining metal, which on examination proved to be a small gold coin. He proceeded in his search, and found a coin of silver. He then communicated the fact to some companions, who commenced an active search into the shoal of mud, and in a short time a great number of pieces of the precious metals were secured. One of the gold coins, though much defaced from long contact with the shingles, was pronounced to be a rose noble, worth 3*l.* The silver coins were still more obliterated, and were very thin, although not much corroded. They are supposed to be shillings, and some are of the reign of Henry the Eighth. Some of the coins were taken to Lambeth Palace, where they were readily purchased at high prices. The search was continued until the return of the tide, and resumed the following day, but with less success. This singular discovery was made on the shore in front of Lambeth Palace, directly opposite the Lollard's Tower.

Public Meetings.—A public meeting has been held of parties interested in British mines, to consider the best measures to be adopted to avoid the consequences which it is feared will result to all mining property from the proposed reduction in the duties to be levied according to Sir R. Peel's new tariff upon foreign ores and metals imported into this country. A series of resolutions were carried unanimously, condemning the measures proposed by Government, so far as they related to copper, tin, spelter, lead, and sulphur, and the ores and preparations of those metals; and showing that the result of such alteration, if carried out, is likely to prove destructive to all property invested in mines, besides inflicting serious loss on parties supplying the necessary materials for working, such as powder, candles, timber, iron ropes, and steam engines and other machinery. In the course of the proceedings it was shown by tabular documents prepared from official returns, that the import of copper ore had materially increased; that for the three years ending 1837 having been only 49,391 tons, while that of the three years ending 1840 amounted to 94,483 tons, showing an excess of 45,092 tons, or at the average price of foreign copper ore, 17*l.* 10*s.* per ton, an amount of 789,110*l.* The excess of imports in 1840 over those of 1839 amounted to 11,191 tons, or 195,842*l.*, or 38 per cent.; while the excess of 1840 over 1834 amounted to 550 per cent. It was further shown that the capital embarked amounted to above 4,000,000*l.*, and the amount annually paid for labour to above 900,000*l.*; also that if the proposed alteration were carried into effect, not only would the above amount of capital be totally lost, but many thousands of workmen be thrown out of employment. It was finally resolved that a petition be presented to Parliament against the proposed reduction in the duties on foreign ores and metals.—On Monday the annual meeting of the proprietors of the Van Diemen's Land Company was held, Mr. Burnie, governor of the company, in the chair. From the report it appeared that the survey of the company's territory by the government surveyors was fast progressing towards completion, and that in consequence of the refractory character of a set of emigrants from Ireland, in 1841, the directors had engaged the assistance of Mr. Chambers, a Norfolk farmer, with a view to the introduction of a better system of agricultural labour. Several new families had been introduced into the colony, and cottages were erecting for six or seven additional families. The stock of timber on the 12th July, 1841, ready for sale was 57,000 superficial feet, which was expected to produce 900*l.* The farming stock had suffered extremely from an unusual drought, which was proposed to be remedied by placing tanks in various parts. The number of ewes was 3,700, being 700 more than in the year preceding. The sale of live stock for the twelvemonth was to the extent of 4,755*l.* 5*s.*, being an increase over the previous year of 1,321*l.* 16*s.* 3*d.* In 1841 the number of sheep on the company's lands was 10,183; the cattle, 2,044; horses, 232; swine, 43; and deer, 23. The company had suffered much by the alteration in the assignment of convicts, but it was expected the old custom would be restored. The free labourers on the estates were 65, and the convicts 74, making together 139, being a decrease of 40 compared with the previous year. The expenditure to the 31st Dec. was 11,654*l.* 6*s.* 11*d.*, and the receipts 10,340*l.* 3*s.* 5*d.*, leaving a sum of 1,314*l.* 3*s.* 3*d.* to be provided for by remittances from the colony, as was expected. The report concluded by an expectation that the result of the examination into the affairs of the company by Mr. Gibson, the new commissioner to the colony, would enable the directors shortly to make a more gratifying report to the proprietors.—A public meeting of the inhabitants of the Ward of Farringdon Without was held by requisition on Wednesday, for the purpose of taking steps in opposition to the proposed Income-tax. The chairman, Sir James Duke, Alderman of the Ward, briefly introduced the subject for which the meeting was convened; after which Mr. Wood rose and spoke at considerable length, in opposition to the proposed Government measure, which he described as unjust in its principle, and uncalled for by the exigencies of the State. He concluded by saying that it was the duty of every man to oppose this tax by every means in his power, and he proposed that they should tell their members that "if they did not oppose the measure, they should not have their votes again." If that principle was everywhere adopted, he had little doubt of the success of their opposition. He then proposed the first resolution—"That an income-tax is unjust in principle, unequal in operation, and arbitrary and inquisitorial in its exactions." The motion having been carried unanimously, a second resolution was proposed by Mr. Pontifex, who spoke in its support at great length:—"That the proposition to exact an income-tax in the time of peace can only be to uphold the monopoly of the landed and other class interests, at the expense of all other portions of the community." This resolution was carried unanimously, as were also the following which were subsequently proposed by Mr. R. Taylor:—"That this meeting pledges itself individually and collectively to use every constitutional means to prevent this arbitrary and unjust tax from passing into a law; and that the members of the city of London and county of Middlesex be requested to oppose, by every form within the rules of the House of Commons, this iniquitous and tyrannical measure, operating as it will most extensively against the best interests of this great commercial and manufacturing nation." A number of speakers addressed the meeting in support of the resolutions, and it was finally resolved that a deputation from the Ward be appointed to wait on the members for the city of London and the members for the county of Middlesex, to request them to support the resolutions carried at the Wardmote.—Another meeting was held on Thursday, of parties connected with Australia, New Zealand, &c., to consider what improved means are offered of shortening the time at present occupied in voyages to that part of the world. As noticed in our report of the former meeting, in our Number of the 19th ult., it was stated that Australia was about 16,000 miles distant from this country, and that it required 100 to 120 days for fast-sailing vessels to accomplish the voyage; but if steam-vessels, by way of the Cape, were employed, it would occupy about 66 days; by way of the Red Sea and Bombay, a much shorter passage could be effected; but the mode of transit proposed was, to avail themselves of the advantages offered by the establishment of the Royal West India Steam-Packet Company, whose vessels call at Chagres and Porto Bello twice every month, completing the voyage from this country to that port, a distance of 4,600 miles, in 25 days. From Chagres, it was stated, goods and passengers could be passed over the Isthmus of Panama, and thence to Cruces, and subsequently to Port Nicholson by means of steam communication, a distance of 6,280 miles, which passage by powerful ships could, it is estimated, be performed in about 26 days, and from Port Nicholson to Sidney, a further distance of 1,285 miles, in five days, which would ensure the entire completion of the passage in little more than 55 days, thus saving half the time required to perform it by the common route, while it would be several days less than required *viâ* the Cape of Good Hope. The route proposed was stated to be well supported; and several documents were read, especially one signed by the Peruvian Consul, expressing a high opinion of the scheme. Several parties addressed the meeting in support of the establishment of a railway across the Isthmus, the means at hand to construct the road being stated to be abundant. A gentleman present stated that a committee had been appointed twelve months ago to effect the desired communication; that an agent had been sent out, and that a communication had been opened with the Central Government of America upon the subject; that every facility would be afforded; and that a grant of the necessary land had been promised. It was finally thought desirable by the meeting to nominate certain parties as members of a committee, to effect the object in view.

Chelsea.—Some excitement has been created throughout this parish by the discovery that the coffins in the vaults of Chelsea New Church have for some time past been subject to a system of extensive plundering. At the police-office, on Monday, a man named Hillier, the grave-digger at St. Luke's church, Chelsea, and Carter, an occasional assistant, were charged by the churchwarden on suspicion of stealing a quantity of brass ornaments from the coffins placed in the catacombs underneath the church. The evidence produced was of a long and complicated character; but the substance of it was as follows:—It appears that the sexton a few days since, on going down into the vaults, accidentally discovered that the brass handles and inscription-plates of all the coffins within reach had been wrenched off and taken away; and from the fact that the prisoners had constant access to the vaults, suspicion of the robbery immediately attached to them, and they were consequently apprehended. The prisoners, however, denied all knowledge of the theft, and urged that no suspicion ought to attach to them more than to others who had the use of the keys. The carpenter who heated the church had a set of keys for his own use, and so had the clerk of the parish, who had since absconded. From further evidence it appeared that the vaults had, generally speaking, been left in an unprotected state; that it was in the power of many persons to commit the offence charged against the prisoners; and that there was no direct testimony which could fix the offence upon them. The Magistrate, however, decided on remanding the prisoners, but admitted Hillier to bail.

Hampton.—The funeral of the late Earl of Munster took place on Tuesday, his lordship's remains being deposited in a vault, in the church of this village, intended for the members of his family. The funeral procession left Belgrave-street at 8 in the morning. It is stated that in consequence of the number of applications on the part of the nobility to be allowed to have their carriages follow, as a mark of respect to the memory of the late earl, it was determined by his lordship's relatives to decline all such offers, and consequently the private carriages that followed were confined to those of the Queen Dowager and the other branches of the Royal family. The cavalcade passed through Belgrave-square, and thence by Knightsbridge to Fulham, and by Wimbledon and Kingston to this place, which it reached by half-past 11; and the interment took place at 12.

Strawberry Hill.—Considerable interest has been manifested among the higher circles, and by the public generally, on the subject of the sale which has been announced to take place at Strawberry-hill, of the far-famed collection of Horace Walpole—a collection which is said to be in its kind perfectly unique, containing a large quantity of various specimens of art, of almost all ages and countries, and a great diversity of books, prints, pictures, gems, and other curiosities. The catalogue alone forms a quarto volume of 250 pages, and there are said to be upwards of 15,000 printed volumes in the library, besides manuscripts and original letters. The private view of the collection commenced on Monday, visitors being admitted by means of tickets; and the roads leading to Strawberry-hill through Richmond, Twickenham, and the other approaches to its gates have, during the week, been crowded by numerous parties anxious to view the objects of interests it contains. The first and second editions of the catalogue, 1000 each, were, it is stated, disposed of in three days, and the demand for them is still said to be very great. The sale is announced to commence on the 25th inst., and will continue for a month.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis from all causes registered in the week ending Saturday, March 19:—Males, 430; Females, 362; Total, 792. Weekly average, 1838-9-40-1: Males, 467; Females, 445; Total 912.

Provincial News.

Brighton.—The first meeting of the creditors of Messrs. Wigney and Co., bankers of this town, was held at the Town-hall, on Monday. The room was crowded with creditors and others interested in the business, which appears to have been the chief topic of conversation in this place since the stoppage of the bank. The principal business transacted was the proving of debts and the appointment of assignees. In the course of the examination it was stated that the property was likely to realise nearly 17,000*l.*; and the liabilities were calculated to amount to between 130,000*l.* and 140,000*l.* The debts proved during the first two days of the meeting amounted to upwards of 50,000*l.* An important decision was given in the Court of Requests on Wednesday, relative to this bankruptcy. Messrs. Bass and Co., merchants of this town, brought an action against Mr. Edlin, landlord of the Gloucester Hotel, for the recovery of 10*l.* It appeared that about nine o'clock on the morning the notice of suspension of payment was posted at the bank, Mr. Edlin sent his servant to Mr. Bass's for change for a ten-pound note of Messrs. Wigney's bank. Ten sovereigns were given by Mr. Bass's clerk in exchange; and at ten o'clock the same morning the notice of suspension of payment was posted at the bank. Mr. Edlin was waited upon by the clerk of Mr. Bass, and told what had occurred; when Mr. Edlin said he had received the note from an officer of the Scots Greys, but did not return the money. The judge of the Court gave a verdict for the plaintiff, on the ground that the note was changed after the bank had finally closed. This decision, it is said, will govern a number of similar cases.

Bristol.—On Wednesday a meeting of the master boot and shoemakers of this city, with a deputation from the journeymen, was held for the purpose of taking steps in opposition to the clause in the new tariff affecting the importation of foreign boots and shoes. The chairman opened the proceedings by stating that the proposed duties in the new tariff would be completely ruinous to the home manufacturer, particularly in the light trade, which was the only remunerative branch. He said it appeared from returns that the importation of French shoes into London, even under the present duty, was so extensive as to destroy one-third of the usual home-trade, and that one house in London was taking 90*l.* a-day for French shoes. He recommended the meeting to be unanimous in respectfully representing to Government the ruin to their trade which would ensue by the carrying of the proposed measure. Several persons addressed the meeting to the same effect, and ultimately a deputation was appointed to obtain an interview with Government on the subject. A number of meetings of a similar character, but applying to different clauses in the new tariff, have been held in many other towns throughout the country.—The eminent firms of Acramans, Morgan, and Co., and of D. E. and A. Acraman, of this city, have determined on calling their creditors together. An excessive outlay of capital beyond the means of the parties, more particularly in machinery and shipbuilding, is said to have been the immediate cause of the stoppage. An examination into the state of their affairs, at their own request, it is stated, has been going on for some days past, which is said to report favourably of the final issue.

Bedford.—A local paper gives the following account of the capture of a horse-stealer at Woburn fair. It seems that Mr. Whitechurch, of Halton Cambs, near Royston, having had a horse stolen, and receiving some intelligence of the route the thief had taken, pursued him to Woburn, and gave information, with a description of the horse, to the superintendent of police. The latter proceeded to the fair, and seeing a horse answering the description, went up to the dealer and asked him the price of it. Mr. Whitechurch, in the meantime, approached them, when the dealer immediately ran off and left the horse in their possession. He was pursued, and after some time captured, when Mr. Whitechurch was surprised at finding that the thief was his own nephew. He was, however, obliged to appear against him, and the prisoner was committed to take his trial for the offence.

Berwick.—It is stated that the Old Bank, the stoppage of which we have noticed in previous Numbers, is expected to pay 10*s.* 6*d.* in the pound, the liabilities of the estate being estimated at 275,000*l.* and the assets at 145,000*l.*

Blackburn.—It is stated that the workpeople employed by Messrs. Hornby and Co., of Brookhouse Mills in this town, have refused to work, in consequence of an attempt to reduce their wages. The number of persons who have left their employment is said to be about 1,500.

Falmouth.—A meeting of the lords and adventurers in the mines in Cornwall was held at Redruth on Monday, to take into consideration the provisions of the proposed new tariff, as far as they affect copper, tin, and other metals and minerals produced in this country. Some of these provisions or rates of duty on foreign metals and metallic ores were regarded by the meeting as objectionable, and calculated to inflict mischief on the Cornish mines, and on other great interests in the county dependent on them. A committee was formed to attend to the subject, and to co-operate with the Cornish Members, in order to obtain modifications of some of the rates of duty proposed to be levied on foreign ores.

Manchester.—The ceremony of laying the foundation-stone of a monument to the late Mr. Henry Hunt has taken place in this town in the burial-ground attached to the Rev. J. Scholefield's Chapel. The Chartists, as a prelude to the ceremony, had a procession, which formed in Stevenson's-square, and thence proceeded to Ardwick-green to meet Mr. F. O'Connor. Having visited Salford, and passed through several of the principal streets of the town, the procession halted in Every-street, when the ceremony was performed; a penny being required of each person for admission to witness it. The stone was laid by Mr. O'Connor, who afterwards delivered a long oration to the meeting.—A serious fire occurred in this town on Saturday, whereby the amphitheatre, belonging to Mr. Batty, in Great Bridgewater-street, was entirely destroyed. The origin of the fire is not known, but the damage done is estimated at upwards of 2,000*l.*

Reading.—A public meeting has been held by a number of the leading farmers and agriculturists accustomed to attend the market in this town, for the purpose of taking into consideration the best method of demonstrating their hostility to the proposed Government measures relative to the importation of foreign corn. The chairman, Mr. J. Haslam, in a speech of considerable length, introduced the subject for which the meeting was convened, and severely condemned the course pursued by Government in proposing any alteration in the scale of duties on corn. He was followed by Mr. Clowes, who spoke to the same effect, and proposed the first resolution—"That this meeting views with great anxiety and fear the proposed plan for an alteration in the Corn-laws, now before Parliament, believing that its effects will be most injurious to the interests of the English farmer and landowner, without being beneficial to the manufacturer or the labourer." Mr. Clarke then addressed the meeting, and briefly proposed the second resolution—"That this meeting deeply regrets that the majority of the members of the House of Commons should have consented to relinquish the principle of protection hitherto possessed by the farmer, and they consider it their duty to take active measures to show their dissatisfaction with the proposed new Corn-laws; and that a petition to the House of Lords, expressing this feeling, be prepared." Both resolutions were carried unanimously; and it was determined that a petition in conformity with them should be drawn up, and left for signature in several places of the town.

Stockport.—A serious outrage has been committed in this town by a party of soldiers belonging to the 61st Foot, at present stationed here. It appears that the police have frequently had occasion to bring some of these soldiers, who are chiefly Irish, before the magistrates, for disorderly conduct; and on Wednesday, the 23d ult., two of them were brought up, and fined for a violent assault on a policeman. In consequence of this the soldiers determined to be revenged on the police; and for this purpose upwards of 50 assembled in the evening of the same day, armed with bludgeons, and some with bayonets, when they traversed the principal streets of the town, in search of the police, who, however, kept out of their way. They then visited several public-houses, ill-treated the inmates, at the same time crying out for the police to make their appearance. In their way through the town they assaulted upwards of 50 individuals, some of them seriously; and after conducting themselves in this manner for about an hour they retired in a body to the barracks. Shortly after the commencement of the outrage numbers of wounded persons crowded the police-office, and the mayor and other magistrates proceeded to swear in persons to assist the police in restoring peace. Before this force, however, could be got ready, the soldiers had gone to the barracks. A broken bayonet was found in one of the streets, where the soldiers had seriously wounded several individuals. The soldiers were confined to the barracks on the following day, and the peace of the town was restored. None of the party who committed this outrage have yet been apprehended, though an active investigation into the whole transaction has been commenced, and the authorities have communicated with the Secretary of State on the affair.

Sunderland.—On Saturday a numerous meeting was held at the Exchange in this town, to take into consideration the rates of duty imposed by the new tariff on the importation of foreign and colonial timber into this country. The Mayor, Sir H. Williamson, Bart., took the chair. Mr. Spence, a timber-merchant of this town, first addressed the meeting. He expressed his astonishment and dissatisfaction at the extensive alteration proposed by Government in the timber duties, and recommended that every means should be adopted to prevent the measure from being carried into effect. There could, he said, be no question, should the measure be passed, of the destruction of our American timber trade, and he should, therefore, move a resolution condemnatory of the alteration in these timber duties, of which, he hoped, the meeting would approve. The resolution having been read, Mr. Charleton, a timber-merchant, seconded it. Mr. Storey opposed it, being of opinion that the proposed alteration in the duties would be a considerable improvement. Mr. Tanner, a shipowner, then addressed the meeting at great length. He could not, he said, coincide with the views of Mr. Spence; there could, he thought, be no doubt that Ministers had taken the subject into their serious consideration, and devoted to it all the ability which they were known to possess; and he certainly was of opinion that although this measure might cause a little inconvenience at first, it would ultimately be productive of great good. He concluded by moving as an amendment—"That this meeting declines to interfere with the duties proposed by Government on the importation of foreign and colonial timber." Mr. Ord seconded the amendment; and stated that though he should himself be a sufferer by the proposed change in the duties, that fact would not induce him to oppose the alterations proposed by Sir R. Peel. Mr. J. J. Wright followed, and spoke against the resolution of Mr. Spence. He was convinced that the alterations in these duties proposed by Sir R. Peel, instead of producing the disastrous effects predicted by Mr. Spence, were, as far as the British shipowner, the British shipbuilder, and the labouring classes are concerned, pregnant with good, and by reviving the present depressed state of trade and commerce, would confer the highest advantage on the country. After several other speeches had been delivered, in opposition to Mr. Spence's resolution, the Mayor put the amendment, which was carried unanimously; the mover and seconder alone voting for the original motion.

Windsor.—Two Wapiti deer, which have been purchased for her Majesty, have within the last few days been brought to Cranborne. These animals, a male and female, which have but just arrived in England from their native soil, are already larger than the general run of red deer, though only about 18 months old, and consequently not yet arrived at their full growth. They are noble-looking animals, are perfectly docile, and will shortly be set at large in the Great Park. The Zebus, or Indian Buffalo-cows, belonging to her Majesty, one of which has lately produced a fine calf, are also at Cranborne; and since the return of the Court to Windsor, her Majesty and Prince Albert, with their suite, have in the course of their rides proceeded to Cranborne to see them.—The usual Easter hunt with the royal buckhounds took place on Monday, the place selected for the meet being Stoke-common, about six miles from this town. The attendance of sportsmen was very numerous, there having been a general expectation that her Majesty and Prince Albert would be present on the occasion. The Court, however, did not attend, her Majesty having proceeded that morning, on horseback (for the first time since the birth of the Prince of Wales), to the Great Park, accompanied by Prince Albert, and attended by a numerous retinue, to witness a hunt by his Royal Highness's beagles. At 11 the deer was uncarted on the common, and after running through the numerous crowd, composed, it is said, of some thousands of horsemen and pedestrians, it took the direction of Burnham beeches, followed, after 10 minutes' grace, by the multitude of sportsmen, many of whom showed their inexperience in the art of riding to hounds by the numerous casualties which occurred. After a run of an hour and a half the deer was taken at Moor Park, in Hertfordshire, the seat of the Marquis of Westminster, only about 100 of the sportsmen being up at the finish.—On Wednesday the private meet of the royal buckhounds took place at Salt-hill, when his Royal Highness Prince Albert, Prince George of Cambridge, Prince Edward of Saxe Weimar, and a select party of nobility and gentry, attended. The deer was uncarted near Farnham-lane, and went away in the direction of Farnham, heading back to the Great Western Railway, which it crossed, just after a train had passed, and proceeded down to the Thames, where it took water and swam to the opposite shore, the hounds and huntsmen proceeding over Maidenhead Bridge. The deer was shortly after taken at Foxley's Farm, at Bray, after a run of an hour and a half. His Royal Highness Prince Albert appeared to enter into the sport with considerable spirit, and, it is said, took several ditches and fences, and two or three awkward brooks, in sportsmanlike style.—On Monday next, it is announced that Prince Albert will lay the first stone of the new Military Church about to be erected in the borough of New Windsor. It will contain about fourteen hundred people. The clergy, military, and neighbouring gentry will meet the corporate body at the Town Hall, and walk from thence in procession to the site, where they will receive the Prince on his arrival. The Royal Horse Guards and 72d Highlanders will attend on the ground, and the regimental and parochial schools will also be in attendance, and take part in the ceremony. Temporary galleries will be erected for the accommodation of the public, who will be admitted by free tickets. Should the weather prove favourable, the event, it is expected, will be of an interesting character.

Worcester.—We are informed by a local paper that Hartlebury Castle is now undergoing general repair, and that it is understood to be preparatory to its being occupied as the permanent residence of the bishop of this diocese, and of those who may succeed him in the see. The palace in this city, so long the chief seat of the episcopate, will, it is said, become the residence of the Dean.

Yarmouth.—By her Majesty's commands, Sir H. Wheatley has addressed Captain Manby, at this port, and forwarded to him the gold coronation medal, begging his acceptance of it as a small mark of the sense her Majesty entertains of the usefulness of his inventions in the preservation of lives from shipwreck.

York.—A petition was lately presented in the House of Commons by Mr. O. Gore, M.P., from the Welsh inhabitants of the West Riding of this county, praying for Bishops who thoroughly understand Welsh, in which a passage occurs from which it appears that the correctness of the ritual in Welsh depends on the Welsh Bishops, and therefore that a deep knowledge of the language is enjoined by the Act, without which no person is qualified by law to be a Welsh Bishop. The passage in the petition referred to is as follows: "That your petitioners look upon the practice of appointing bishops to Welsh sees, ignorant of the Welsh language, diametrically opposed to the Act of Uniformity, which enjoins that the Bishops of Hereford, St. David's, Asaph, Bangor, Llandaff, and their successors, shall take such order among themselves for the soul's health of the flocks committed to their charge within Wales, that the book hereunto annexed (the Book of Common Prayer) be truly and exactly translated, and being by them, or any three of them at the least, viewed, perused, and allowed to be imprinted; and they shall have power to correct and amend in writing any error committed by the printer in printing of the same book, or of anything therein contained, and shall certify in writing, under their hands and seals, or the hands and seals of any three of them, at the end of the same book, that they have examined and compared the said book, and find it to be a true and perfect copy. Your petitioners humbly think that if a similar commission were issued in the present day, it would place the prelates of the Welsh Church in a very painful and disagreeable position."

Railways.—A special meeting of the proprietors of the Durham and Sunderland Railway has been held, the object of which was the creation of new shares, and the borrowing on mortgage or bond of a further sum of money. The outstanding debt of the company was stated to be about 40,000*l.*, of which 30,000*l.* were "renewable" bills, on which the directors were paying the rate of 8½ per cent. interest, which it was calculated drew from the shareholders nearly 1,000*l.* per annum. It was proposed to issue 1,600 new shares at 20*l.* each, and to borrow the remainder on bond; to which proposition the shareholders assented, after it had been suggested that there was a necessity for prudent management in order to redeem the loans now contracted, and to pay a dividend. The directors in reply stated that the undertaking was conducted on the strictest principle of economy, and that all expenses were *bona fide.* The profits of working had not at present been large, but it was remarked that they were capable of extended development, and would, no doubt, eventually pay a reasonable dividend.—From some statistics of railways which have appeared in the publications devoted to the subject, the following interesting information connected with railway traffic is derived: It is stated that the Birmingham Railway, 112½ miles in length, produced in the first half-year after it was open throughout, 270,000*l.*, or 2,318*l.* average per mile; the Grand Junction, 79 miles in length, 119,000*l.*, or 1,506*l.* per mile; the Manchester and Leeds, 50 miles in length, 116,000*l.*, or 2,320*l.* per mile; the Manchester and Liverpool, 31 miles in length, 66,000*l.*, or 2,129*l.* per mile; and the Great Western, 338,000*l.*, or 2,000*l.* per mile. The receipts of the three principal of these railways, comparing the former with those for the last half-year, ending Dec. 1841, increased on the average 80 per cent., the Birmingham receipts being 429,000*l.*, the Grand Junction 241,000*l.*, and the Manchester and Liverpool 137,000*l.* The cost per mile of these several railways, with the dividends they are now paying, is given as follows: Birmingham cost per mile 51,842*l.*, dividend payable 12¾ per cent.; Grand Junction cost per mile 21,859*l.*, dividend 12 per cent.; Manchester and Liverpool cost per mile 46,281*l.*, dividend 10 per cent.; Manchester and Leeds cost per mile 5,456*l.*, dividend 6 per cent.; and the Great Western cost per mile 53,241*l.*, dividend 6 per cent. The fluctuations in the value of railway shares of the years 1837 to 1841, dating the prices on the first day of the quarter of each year, give some idea of the extent of dealing and estimation in which they are held in the public market: Bristol and Exeter shares, in 1837, fluctuated between 3½ and 5, these being the lowest and highest prices; in 1838 they fluctuated between 10½ and 18; in 1839, between 25 and 30; in 1840, between 44 and 76; and in 1841, between 77 and 56; the increase in value being regulated in this, as in other cases, by the payment of calls, &c. Eastern Counties, in 1837, fluctuated between 2 and 2¼; in 1838, between 1 and 6¼; in 1839, between 7 and 8½; in 1840, between 16 and 10; and in 1841, between 9 and 7¾. Edinburgh and Glasgow, in 1838, fluctuated between 4½ and 9½; in 1839, between 7 and 10; in 1840, between 11 and 30; and in 1841, between 30 and 39. Grand Junction, in 1837, fluctuated between 158 and 180; in 1838, between 208 and 191; in 1839, between 204 and 194; in 1840, between 205 and 253; and in 1841, between 212 and 198. Great Western, in 1837, fluctuated between 46 and 65; in 1838, between 67 and 91; in 1839, between 78 and 60; in 1840, between 60 and 83; and in 1841, between 91 and 77. Brighton, in 1837, fluctuated between 8 and 1¼; in 1838, between 4 and 11; in 1837, between 9 and 17; in 1840, between 17 and 29; and in 1841, between 44 and 46¾. Greenwich, in 1837, fluctuated between 21 and 15; in 1838, between 15½ and 17; in 1839, between 17 and 14; in 1840, between 13 and 7; and in 1841, between 8½ and 7½. Blackwall, in 1837, fluctuated between 1½ and 1; in 1838, between 2½ and 5½; in 1839, between 6 and 10; in 1840, between 13 and 21½; and in 1841, between 18 and 9¾. Liverpool and Manchester, in 1837, fluctuated between 218 and 200; in 1838, between 195 and 205; in 1839, between 204 and 190; in 1840, between 183 and 186; and in 1841, between 185 and 198: and Birmingham, in 1837, fluctuated between 146 and 101; in 1838, between 158 and 178; in 1839, between 179 and 140; in 1840, between 142 and 189; and in 1841, between 172 and 154.

IRELAND.

Dublin.—It is announced that the Lord Lieutenant has fixed next week for his departure from this country for a temporary sojourn in England, and that he will return early in May. On Thursday a ball was given in compliment to the Viceroy and the Countess de Grey, by the nobility and gentry composing the Kildare-street Club, at the Rotunda. No entertainment on a similar scale has, it is said, been given in Ireland since the ball and supper given by the Knights of St. Patrick in honour of his late Majesty George IV. when on a visit to this country.—The Committee of Antiquities of the Royal Irish Academy have opened a subscription for the purchase of the collection of Irish antiquities, coins, and medals of the late Dean of St. Patrick's. It is intended that this collection, which the committee have agreed to purchase for the sum of 1,000*l.*, shall be preserved in the Royal Irish Academy, and incorporated with the museum already deposited there, and that the united collection shall be open to students and the public. Upwards of 600*l.* have been subscribed, chiefly by members of the Academy, towards the funds for this purpose.—A serious accident happened to the Marquis of Waterford a few days since. His Lordship had come to town to ride at the annual steeple-chase got up by the noblemen and gentlemen who hunt in the vicinity of this city. In the second race his horse stumbled at the last leap but one, and rolled over his Lordship, who lay on the ground for some minutes in a state of insensibility. He, however, soon rallied, and left the course in a carriage, and is stated to be doing well.—The Dublin and Kingstown Railway Company have held their annual meeting in this city. The report showed an increase in passengers of 36,836 in the year, in income of 1,245*l.* 14*s.* 6*d.*; the gross profits on the year amount to 19,268*l.* 6*s.* 11*d.*, after deducting from which the annuity to the Board of Works, and interest on other loans, there remains a surplus of 11,696*l.* 8*s.* 4*d.*, from which a dividend of 5*l.* per share has been declared. The Board of Directors strongly recommend the application of the atmospheric mode of traction to the intended line to Dalkey, and a special meeting is called for the 6th inst. to consider the recommendation.—On Wednesday the annual cattle show of the Royal Dublin Society was held on their extensive premises in Kildare-street. It is said that the number of cattle of all descriptions exceeded that at any former exhibition, and there was a numerous attendance of noblemen and landed proprietors from all parts of Ireland. His Excellency the Lord Lieutenant was among the visitors.—The usual weekly meeting of the Repeal Association has been held, at which Mr. T. Reynolds presided. The proceedings were uninteresting, and the amount of rent announced for the week was 63*l.* 13*s.* 8*d.*—The Royal Western Yacht Club has changed its *rendezvous* from the river Shannon to that beautiful expanse of water Bantry Bay, extending twenty-five miles in length and six in breadth, perfectly sheltered on both sides. The tidal objection to the Shannon prevented numbers from attending the annual meeting.

Cork.—We reported in a former Number that the Grand Jury of this city had memorialised the Lords of the Admiralty, recommending this port as the Irish mail-packet station between the south of England and the south of Ireland. The Hon. S. Herbert, Secretary to the Admiralty, has returned as an answer, that their Lordships see many and great objections to the plan proposed.—It is stated that this city is fixed on for the first provincial annual meeting and exhibition of cattle under the direct patronage of the Royal Agricultural Society of Ireland. The meeting is announced to take place in July, and it is hoped that the Lord Lieutenant will honour this city with his presence on the occasion. Several English breeders have, it is stated, signified their intention to exhibit stock at this meeting.

Londonderry.—A local paper informs us that a "monster steamer" will shortly be launched at this port from the building-yard of Capt. Coppin. She is to be fitted with Mr. Smith's Archimedes screw, the patentee being at present in this town to give the necessary instructions for that purpose. She will carry 1,300 tons of cargo, exclusive of her engines, with 700 tons of coals; the entire deck to be free for passengers. She is to be pierced for 44 guns in the upper deck, and full ship-rigged; and her general construction is said to be of a very superior character.

SCOTLAND.

Edinburgh.—It is officially announced that the mail bags between this city and Glasgow are in future to be carried by the railway conveyance, to commence on Wednesday next, the 6th inst.

Glasgow.—The local papers inform us that during the night of Good Friday this city was visited with one of the most severe storms of wind experienced for many years past. The gale during the afternoon was considerable, but in the evening it increased to a hurricane, so that the streets were nearly cleared, passengers finding it difficult to maintain their footing, while the danger was increased from the number of chimney-tops and slates which were hurled from the tops of the houses. As a proof of the violence of the wind, it is stated that in the Gallowgate, during the height of the storm, a sign-board was wrenched from a shop and borne nearly 60 yards further up the street. In the course of the night an accident of a serious nature, accompanied by loss of life, occurred at Garnkirk Fire Brick and Lime Works. Two of the stacks were blown down by the hurricane, and five men who happened to be in the works were buried in the ruins. After some time they were extricated, when two were found to be dead, and the other three much injured. The damage done by the storm in the city and neighbourhood is stated to be extensive; and the shipping in the port and also at Greenock have suffered considerably, several vessels having been driven from their moorings, and three small craft rendered complete wrecks.—The wreck of the steam-boat Telegraph, the explosion of which, as reported in our last, was attended with such serious consequences and loss of life, has since been brought into this harbour, and submitted to a careful examination. The boiler has been inspected by scientific gentlemen, who, it is said, have given it as their opinion that the accident occurred from want of due attention; the boiler showing by its appearance that it had been overheated. It is further stated that the regulator attached to the engine and boiler, for the purpose of ascertaining the pressure, had gone wrong in the morning passage up to this harbour, and it is supposed that this had prevented the engineer from knowing the amount of pressure. It also appears that no steam was allowed to escape when the boat stopped at this port or at Helensburgh. The engineer who made the engine has also made an examination of the boiler, and the following is said to be the result of the investigation:—"That the accident had been occasioned by the want of a due quantity of water in the boiler, as the plates in the crown or cover of the fire-box had been red-hot; that the plates were found riven completely across, and the heat had been so great, that though the fire-box or furnace is only about three feet three inches wide, the plates had been stretched or expanded, so as to measure four feet; and there were also on the plates several large blisters, which could only be the result of the intensity of the heat. The violence of the explosion had been so great as to tear one of the corners of the fire-box a considerable way down, the plates at that corner being five-eighths of an inch thick. The same rent extended through a solid bar of iron three inches by two; but so far as could be seen, none of the tubes of the boiler were injured."

Aberdeen.—A local paper informs us that a few days ago a large golden eagle was shot on the hills of Glengolly, Ballindalloch, by Mr. Allen Grant, farmer. The following were its dimensions:—Expansion of wing, seven feet two inches; length of first four feathers, 26 inches; circumference of leg, eight and a half inches. Its talons were of an extraordinary size; and on the day it was shot it killed two sheep.

THEATRICALS.

Drury Lane.—As usual at this season of the year, the theatres and other places of public amusement in the Metropolis have been visited by great numbers of persons in the course of the Easter-week. The tragedy of Macbeth was revived at this theatre on Monday before a numerous audience. Mr. Macready appeared as *Macbeth*, and Mrs. Warner as *Lady Macbeth*. To the tragedy succeeded a new operetta, entitled "The Students of Bonn," the music of which is from the pen of Mr. J. S. Rodwell, who is also said to be either the author or translator of its libretto. The following is a brief sketch of the plot:—A set of young German students engage in flirtations with the inmates of a young ladies' boarding school, with whom they carry on a correspondence through the medium of a cunning maid. Five of these damsels are of the name of *Marie*; and, as each of the young lovers knows his mistress only by her christian name, a good deal of confusion and some amusement are produced by the maid distributing the billets, with which she is intrusted, among the girls at random. At the same time there is carrying on a plot of a more serious kind; consisting of the loves of one of the *Maries* with one of the students, and his jealousy of the young lady's brother, whom he supposes to be his rival in her affections. Some of the scenes were amusing and excited a good deal of laughter, and the piece was successful.

Covent-Garden.—The Easter novelty at this theatre was entitled "The White Cat," founded on the well-known fairy legend or nursery tale of that name. The first scene represents *King Wunsuponatyme* (Mr. Bland) seated on his throne and surrounded by his court, in converse with his intimate counsellor, and repining at the cares of state previously to resigning his crown to one of his three sons. He decides upon leaving his kingdom to any one of them who shall bring him a dog that could get through his ring. They all set out in quest of the tiny prodigy, and *Prince Paragon* (Madame Vestris) is accompanied by *Jingo* (Mr. Harley); but suddenly the scene changes, and they find themselves "15,000 miles from everywhere," and *Paragon* begins to think that the earthquake has come at last. They find themselves at the gate of a palace, at the door of which appear several hands bearing tapers, and cats of all sizes and shapes are frisking about. The interior of the palace is next seen, and presents a spectacle of great scenic effect. The three Princes were played by Madame Vestris, Miss Murray, and Miss Lee, the first of whom becomes enamoured of the white cat—a part entrusted to Miss Marshal, who sustained it well. The scenery was tasteful and ingenious, and the piece was altogether favourably received.

Haymarket.—The summer season at this theatre opened on Monday with "The School of Reform, Suzanne, and the World of Dreams." These pieces are already well known to the public; there was no change in the cast of characters, and they were well received by a numerous audience. Mr. and Mrs. Kean were announced to make their first appearance at this theatre since their marriage on Monday next.

Olympic.—The holiday piece at this theatre was founded on the well-known legend of "Whittington and his Cat." The burletta is from the pen of Mr. Mark Lemon. The incidents somewhat vary from the nursery tale, and the opening scene is changed from the vicinity of Bow to the *Times* office, where *Past* and *Present* preside by turns, and after exhausting the whole stock of standing jokes about the earthquake, *Past*, to oblige Mr. Murphy, rakes up *Whittington*, and *Present* presents him and his *Cat* to the Olympic, as the subject of its holiday offering. The piece was well got up, and by the aid of singing, attractive scenery, and the comic powers of Mr. Wild as the *Cat*, it gave satisfaction to a crowded house.

Miscellaneous.

Encke's Comet.—At the sitting of the Academy of Sciences in Paris, on the 14th ult., an interesting communication was made by M. Arago relative to Encke's comet, which had, he said, been seen, and carefully noted, at the Observatory at Paris by two astronomers, MM. Laugier and Mauvais. The observations were made on the 12th ult., when the position of the comet, both as to its right ascension and its declension, was so clearly determined as to enable the parties to set them down on the tables. The position was carefully compared with that laid down beforehand by Professor Airy and the German astronomers, and the difference was found not to exceed 20 seconds. M. Arago expressed his satisfaction that circumstances had permitted these decisive observations, as in a few weeks hence they would have been impossible, for the comet will then be in regions of the heavens destitute of any brilliant stars. He added, that the Academy had just received a communication from an astronomer of Marseilles, M. Valz, announcing also some satisfactory observations respecting this comet. One of the principal objects at the Observatory, said M. Arago, was to ascertain the diameter of the comet, a very difficult operation on account of the extent of this pale and vaporous body, but one of great interest. M. Valz having stated that the comet, which returns at short intervals, diminishes in diameter at each return, an opinion which appears to be a modern edition of the hypothesis of Herschel, who stated that comets at each transit lose to a great extent their volatile nature, and become more and more solid, M. Laugier, in his observation of the 12th ult., concluded that the angular diameter of the comet was one of three minutes, which would give an enormous size to it, considering its distance from the earth.

Preservation of Bodies.—M. Gannal, a French chemist, has discovered the art of altogether preventing the decay of animal matter, if we may credit a letter addressed by the Mayor of Artigues to the Prefect of the Gironde. A young child was murdered in the night of March 16, 1840. The corpse was prepared by M. Gannal, and remained exposed till the 2d June, when it was sent to Bordeaux for production at the trial of the assassin. In the month of July it was buried. At the end of 1841 it was taken up, the coffin opened in the presence of the mayor and another witness, and the corpse was found in a state of perfect preservation. The intestines were in no way altered; and the substances contained in the stomach appeared to be in the same state as at the time of death. Another mode of preserving bodies appears to have been discovered in Italy:—A letter from Rome states that a young physician of that city has succeeded in discovering the means of petrifying all substances of organic formation, without their being changed materially in colour, a few days only being sufficient to effect this transformation. The discoverer of this process has already exhibited flowers, birds, fishes, and even human heads, beautifully petrified.

Law.

Home Circuit.—*Barritt* v. *The Duke of Normandy.*—This was an action to recover the sum of 283*l.* for goods sold and delivered. The plaintiff was an upholsterer, residing at Camberwell, and the action was brought to recover the sum of 238*l.* for furniture supplied to the defendant whilst residing in that neighbourhood. The counsel for plaintiff stated that the defendant claimed to be King of France, but was residing in this country as a private individual, and if under such circumstances he incurred any debts, he was bound to pay them as much as any other person. The defendant at first resided at Camberwell-green, but subsequently removed to the Old Kent-road, and then applied to the plaintiff to furnish his house. Goods were supplied according to his wish, but in August last the plaintiff having reason to suppose that defendant was about to return to his hereditary estates in France, sued him for the balance of his account, which amounted to the sum in question. After some witnesses had been called to prove the delivery of the goods and their value, Mr. Baron Alderson suggested that as there was a cross action it would be better to have both cases referred, when their merits could be inquired into together. The jury returned a verdict for the plaintiff for the amount claimed, subject to a reference.

Stephens v. *Emly and Another.*—The plaintiff, who is a builder, sought to recover the sum of 52*l.* 15*s.* 9*d.*, for work done at the Alliance Club-house, Pall-mall, of which the defendants, Mr. Emly and Mr. Hastings, were members. It appeared that in the early part of the year 1837 a number of gentlemen established a club, which they called the Alliance, and took suitable premises in Pall-mall, the lease of which was granted to the defendants and two other gentlemen. The affairs of the club were conducted by a committee selected from the general body of members, whose duty it was to give orders, audit the accounts, &c. The defendants were on the committee from its first appointment to the final breaking up of the establishment in 1839. The club did not answer the expectation of the founders, and was abandoned in consequence of want of funds to meet the necessary expenses; orders to tradesmen were generally given by the committee, through the secretary; and payment was made by checks, signed by three of them. The work which formed the subject of the present action was ordered to be done in the usual manner, and at various times, but it was not distinctly shown that on any occasion when such orders were given both the defendants were present. One of the items was for erecting a platform in the front of the building at the time of the coronation, and it appeared that Mr. Emly objected to such an outlay being made in consequence of the state of the funds of the club; but as the question was decided against him, he refrained from attending the committees from that period (June, 1838,) till February in the following year. It was then found that the receipts were totally insufficient to meet the expenditure, the affairs were wound up, and the club was found to be in debt several hundred pounds. The defendants, feeling that the committee was bound to pay the outstanding debts, suggested that each member of the committee should subscribe a certain sum for that purpose; a few paid their portions, but others refused to do so. The plaintiff, being unable to obtain the amount of the bill, brought the present action. Mr. Baron Alderson, in summing up, said the question for the consideration of the jury was, whether the work, the order for which was given by the secretary, was ordered by the defendants, or either of them. If they were satisfied that Mr. Hastings was present when the order was given for erecting the platform at the time of the coronation, he would undoubtedly be liable; but not under the present form of action. The members of a club were not bound, unless by some special agreement. If they were satisfied that the defendants were present when the orders were given, they would undoubtedly be liable; or if they believed that they had agreed to be bound by any order given by the committee, and although they were not actually present when the order in question was given, still they would be equally liable. Mr. Emly, in his letter, said he considered the committee liable for the debts of the concern, and it would be a question for their consideration whether by that he meant that he considered the committee, each and every one of them, bound by a previous agreement. The jury, after a short consultation, returned a verdict for the plaintiff for the amount claimed.

Oxford Circuit.—Crown Court.—*William Seale* was indicted for stealing from George Coleman, Esq., of Dilwyn, a beehive, his property. It appeared that the hive was stolen from Mr. Coleman's premises on the 5th March, and was found, on the 16th, in the prisoner's garden. The prosecutor identified it by some marks which had accidentally been made on the straw. Upon the hive being produced in court for the purpose of identification, some consternation and no little amusement were occasioned, lest the angry tenants should emerge from their frail receptacle, and wreak "indignant vengeance" upon the assembled bar and jury. The counsel for the defence displayed considerable ingenuity in his endeavours to foil the eager curiosity of the jury, who manifested much anxiety to inspect the marks by which it was said the hive could be known; but all his objections were overruled, and the article in question was accordingly borne by the constable (who evidently showed no relish for the task) in a white linen cloth to the jury-box. Strong symptoms of disapprobation were audible from within, which increased to an angry murmur when one juryman bolder than the rest commenced unpinning the outward covering. Several suggestions were advanced as to the means by which the ends of justice should be satisfied, but none of them proved feasible. Amongst others it was proposed by one of the counsel to obtain a special order from the court as the only probable means of enforcing the wishes of the jury, and obedience on the part of the unruly bees; but as it is generally known that the judges are very reluctant to direct any proceedings to be taken which they have no legal power to enforce, this course was also abandoned, and, consequently, the prisoner, much to his astonishment and delight, was acquitted, there being no evidence of the identity of the stolen hive, and consequently a lack of legal proof.

Northern Circuit.—*William Hoyle* and *John Mills*, the former 13, and the latter 11 years old, were indicted for attempting to commit a felony, by endeavouring to burn the cotton-mill of Mr. Charles Haigh, at Spotland, near Rochdale, on the 15th Feb. The circumstances connected with this transaction were given at length in our Paper at the time; and it will, therefore, only be necessary to state that the facts then narrated were substantiated by the evidence given at the trial. At the close of the case for the prosecution the judge said there was nothing to go to the jury against Mills, who was removed from the bar. The counsel for Hoyle then proceeded to address the jury in his client's behalf, contending that it was a wicked and dangerous trick, but not accompanied by an intention to burn the mill. The judge summed up, and the jury found Hoyle guilty. The counsel for the prosecution recommended the prisoner to the mercy of the court, on the ground that he believed the prisoner to be the dupe of more wicked persons of riper years. On some inquiry being made, it appeared that this was the third attempt made within a very short time to fire the mill. The judge said the case was one of a very serious character, and in moral guilt as great as if the whole of the property was actually destroyed, that being the intention. Such things must be prevented. He would consider what it would be best to do with the prisoner before he passed sentence.

NORFOLK CIRCUIT—BURY ST. EDMUNDS.—*Brooks* v. *Jenney*. —This was an action of trespass for cutting and destroying certain thorn-trees growing in the fence of a field called the "Shortlands," the property of the plaintiff. It appeared that the parties are neighbours, residing at Hasketon, in this county, and in 1839 the defendant was surveyor of the highways. In the discharge of that office notice was given to the plaintiff, under the Highway Act, to cut and prune his fences, and the thorn-trees therein growing, which were alleged to have become injurious to the road. The plaintiff accordingly set a man to work, but the defendant Jenney was dissatisfied with the mode in which the order had been complied with, and he therefore obtained an order of justices, under which the defendants themselves proceeded to cut the fences of the plaintiff, through the hands of one Marjoram. That person, however, did his work so effectually as not only to level the whole fence to the ground, but also to cut down a large quantity of thorns of an ancient date and great size, which had been cherished by the plaintiff and preserved on account of their beauty. The plaintiff complained of this, and as the authority of the surveyor does not extend over "ornamental trees," he commenced proceedings against Mr. Jenney and the parties concerned in the execution of the order. The cause came on for trial at Ipswich, in the summer of 1840, and on that occasion the defendant obtained a verdict, the judge before whom the cause was tried being of opinion that they were justified by the order. The Court of Queen's Bench, however, set aside that ruling, and the case now came before another jury, and, after occupying the whole day, terminated at a late hour in a verdict for the plaintiff—Damages, 15*l*.

TATTERSALL'S, THURSDAY.—The room was well attended by influential members, and a good deal of business was done, but at a very trifling variation from the previous quotations. Chatham was again in favour, and left off at 18 to 1 (taken). On the Oaks there was nothing done; and, with the exception of a bet of 14 to 1 about Passion, the Chester Cup was not mentioned. Closing prices:—

2,000 GUINEAS STAKES.

2 to 1 agst Mr Wreford's Wiseacre.

DERBY.

OAKS.

14 to 1 agst Mr. Etwall's Passion.

MARK LANE, FRIDAY, APRIL 1.—The supply of English Wheat since Monday has been so trifling that it is difficult to report on the trade in that article, but we consider that it has a tendency upwards. There has been a good sale of Foreign, where Monday's prices have been taken, and in retail the best red Wheat has made 1s. advance. The holders of Bonded Wheat having generally advanced their terms the sale is checked, and we did not hear of any purchases having been made to-day.—Barley is a dull sale without alteration.—In consequence of the small quantity offering, Beans are a better sale.—Peas remain as on Monday.—There being a large supply of Oats, prices have declined 1s. per qr.—Clover Seed is pressed on the Market at rates considerably lower.

GAZETTE OF THE WEEK.

INSOLVENTS.—W Hooper, Reading, Berkshire, tobacco-manufacturer—G. Brown, Pembroke-cottage, Chapel-street, Grosvenor-place, Middlesex, bricklayer—P. Pyne, Crooked-lane Chambers, City, provision-broker—C. Goodman, Northampton, cutler—A. Crossfield, Whitechapel-road, scrivener—J. Wallworth and T. Wallworth, Manchester, corn dealers.

BANKRUPTS.—S. P. Gladstone, Crisp-street, East India-road, Poplar, shipwright—C J Williams and E. Nevill, Birmingham, factors—T. Scott, Barnwood, Gloucestershire, innkeeper—J. Crowe, Sunderland, innkeeper—H. Duckett, Ramsgate, carpenter—J. Kilsby, Roade, Northamptonshire, shoe manufacturer—S Wild, Manchester, coal dealer—J. Darbyshire and S. Pope, Manchester, calico-printers—E. Smith, Southampton, grocer—E. Frankland, Reading, innkeeper—E. Till, Worcester, butcher—R. Martin, Beccles, Suffolk, carpenter—S. Magnus, Dover, slopseller—G Morrison, Nottingham, lace-manufacturer—C. Jackson, Clitheroe, Lancashire, joiner—E. Linstead, Liverpool, pawnbroker—S. Whagstaff, French's Wharf, Saddleworth, Yorkshire, grocer—W Carr and J. C Carr, Sunderland, merchants—B. Hillyard, Bristol, timber merchant—W. Vickers, Manchester, ironfounder—A. Jarrett, Castle-street, Southwark, hat-manufacturer—J. Wright, Wolverhampton, grocer—S. Garcia, Brydges street, Covent-garden, shell fishmonger—R. Terry, Cheltenham, brewer—J Nutter, Cambridge, miller—J Blake, Westminster, wine and spirit-merchant—F K. Fowell and E. T. Craufurd, Piccadilly, wine-merchants—T. Winder, Lancaster, ironmonger.

SCOTCH SEQUESTRATIONS.—J. P. Nichol, Glasgow, insurance-broker A. Rankine, Kirkcudbright, merchant—R. Stiven, Glasgow, merchant—D. Henderson, Coatbridge, near Airdrie, ironmonger.

BIRTHS.—At Leigh rectory, on Good Friday, the lady of the Rev. R. Eden, of a daughter—At Athens, on the 28th of February, the lady of F. Strong, Esq., Consul at that capital for Bavaria and Hanover, of a son—On the 26th inst., at Swiss Cottage, Ipswich, the lady of Capt. T. Scott, Royal Marines, of a daughter—On the 29th inst., at No 33, Trinity-square, Newington, Surrey, Mrs. R. Meggs, of a daughter—On the 29th inst., at Edward-terrace, Pentonville, Mrs H. Brent, of a daughter, still-born—On the 30th inst., in Hans-place, Sloane-street, Mrs. P. Rose, of a daughter—On the 30th inst., in Welbeck-street, the lady of L. Pole, Esq, of a son—At St. John's Wood, on the 25th inst, the lady of C. A Hepburne, Esq., of a daughter.

MARRIED.—At Gloucester, on the 29th inst., W. Wiggin, second son of T. Wiggin, Esq., of Harley street, London, to Frances Emma Rice, daughter of the Hon. and Very Rev. the Dean of Gloucester—On the 29th inst., at St Marylebone, R. L. Watson, Esq., of Calgarth Park, Westmoreland, to Louisa Anne, only daughter of the Rev. F. H. Cole, of Peterley house, Bucks—On the 30th inst, at St. Pancras Church, H. Johnson, Esq., of March, Cambridgeshire, to Lucy Carolina, eldest daughter of W. H. Pollard, Esq., of Avranches, Normandy—On the 30th inst., at St George's, Hanover-square, Mr. J. Archbutt, of Victoria-road, Pimlico, to Margaret, eldest daughter of Mr. H. Clarke, of New Bond street.

DIED.—On the 28th inst, at her residence, in Holland-street, Kensington, in the 78th year of her age, Mrs Catherine Matcham, relict of the late George Matcham, Esq., of Ashfold-lodge, in the county of Sussex, daughter of the late Rev. E. Nelson, rector of Burnham Thorpe, in the county of Norfolk, and only surviving sister of the late Admiral Lord Viscount Nelson, K.B.—On the 6th Feb., at Malta, of consumption, E. Bush, of Bow-common, London, and late of Wick, Gloucestershire—On the 19th inst., Elizabeth, wife of J. Wood, Esq., of Carlton-terrace, Brixton—On the 24th inst., J. Bauke, Esq., of Southampton-street, Fitzroy-square, late of the Audit-office, aged 80—On the 28th inst., at his residence in the Vassall-road, North Brixton, J. G. Marsham, Esq.—At Cholsey, Berks, on the 29th inst., J. Coles, Esq., formerly of Calcutta, aged 72.

UNIVERSITY COLLEGE, LONDON.
ELEMENTARY COURSE OF BOTANY.

Professor LINDLEY will commence a COURSE of LECTURES on BOTANY to a JUNIOR CLASS, on Tuesday, April 12th. Subject—The Distinctions between the principal Natural Classes and Orders of Plants belonging to the Flora of Europe. The Course is adapted for persons commencing the study of Botany, and for students preparing for the Matriculation Examination at the University of London. Fee, 2*l*.—The Course to the Senior Class will commence early in May. Further particulars may be obtained at the Office of the College.

R. G. LATHAM, A.M., Dean of the Faculty of Arts.
WM. SHARPEY, Dean of the Faculty of Medicine.
CHAS. C. ATKINSON, Secretary to the Council.
March 31, 1842.

UNIVERSITY COLLEGE, LONDON, JUNIOR SCHOOL.

Under the Government of the Council of the College.

Head Masters.—THOMAS HEWITT KEY, A.M., Professor of Latin, University College. HENRY MALDEN, A.M., Professor of Greek, University College.

The School will re-open for the next Term on TUESDAY, 5th April. The year is divided into three Terms: Fee for each Term, 5*l*. The hours of attendance are from quarter past nine to three quarters past three. The afternoons of Wednesday and Saturday are devoted exclusively to drawing. The subjects taught, without extra charge, are Reading, Writing; the Properties of the most familiar Objects, Natural and Artificial; the English, Latin, Greek, and German Languages; Ancient and Modern History; Geography (both Physical and Political); Arithmetic and Book-keeping; the Elements of Mathematics, and of Natural Philosophy and Drawing.

Prospectuses and further particulars may be obtained at the Office of the College.
CHAS. C. ATKINSON,
Secretary to the Council.
24th March, 1842.

The terms of Masters and others who receive Boarders, may be had at the Office of the College.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.
Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l*. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l*. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

DIRECTORS.

SOLICITORS.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c, which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

FINE GRASSES FOR LAWNS.

MESSRS. SUTTON beg respectfully to intimate to Gentlemen intending to make new Lawns, that in addition to their productive Meadow Grasses, they also collect very fine sorts particularly adapted for Lawns, which continue of a fine healthy green colour the whole year, and are perfectly free from weeds. Lawns laid down with these seeds will cost much less than those made with turves. Imperfect lawns may be much improved by sowing seeds over them, barrowing first, and rolling after sowing. Price 30*s*. per bushel, or 4*s*. per gallon. The Trade supplied.—Reading Nursery, March 31.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

New and Cheaper Edition, in 1 Vol. 8vo., Price 2*s*.
(Post free 6*d*. extra.)

HYDROPATHY, or the COLD-WATER CURE! its Principles, Theory, and Practice, with valuable Directions for its Self-application; and a full account of the wonderful Cures performed with it on 7,000 patients of all nations by the Discoverer, VINCENT PRIESSNITZ, of Graefenberg, in Silesia.

London: W. Strange, 21, Paternoster-row, and No. 6, Wellington-street, Strand.

IMPORTANT TO LANDLORDS AND TENANTS.
Just published, price 1s.

ADVICE TO FARMERS HOW TO DOUBLE THEIR CROPS by NEW FERTILIZERS, to secure luxuriant Vegetation by Nutritious Steeps for Seeds, to prevent the ravages of Worms, and to detect frauds and defects in Seeds and Manures.

Sold by Longman and Co.; and by the London wholesale and retail Agents; Gifford and Linder, 104, Strand; Whalley and Co., Liverpool; Toole and Mackay, Dublin; and by all Booksellers and Seed Merchants.

Now ready, Part 2,

BOTANY:—Of the POPULAR CYCLOPÆDIA of NATURAL SCIENCE—4*s*.

Also, bound together, forming one handsome volume, cloth, gilt-lettered, 8*s*. 6*d*.,

VEGETABLE PHYSIOLOGY and BOTANY, being parts 1 and 2 of the Popular Cyclopædia of Natural Science.

"We can say conscientiously, after an examination of the First Part now before us, that if the subsequent volumes are only nearly as good as this, the Publishers will, by their labours, have conferred a great benefit on the rising generation."—*British and Foreign Medical Quarterly Review*.

"The volume, or rather the part before us (for Vegetable Physiology is to be followed by Botany), is an original undertaking, and of a superior kind. Fertile as is our time in endeavours to present the essential principles and striking facts of science in an attractive form, we have met with nothing equal to the Vegetable Physiology "published by the Society for the Promotion of Popular Instruction." The sixth chapter, on "the Food of Plants and the manner in which it is obtained," should be read by every intelligent agriculturist in the country, whether he cares about the principles of vegetable physiology or not."—*Spectator, April* 24, 1841.

Published by Wright, Allis, and Bagnall, Aldine Chambers, 13, Paternoster Row; and Hamilton, Adams, and Co., London.

ILLUSTRATIONS OF THE BOTANY and other Branches of the NATURAL HISTORY OF THE HIMALAYAN MOUNTAINS, and of the FLORA OF CASHMERE.

By J. FORBES ROYLE, M.D., V.P.R.S., F.L.S. & G.S., M.R.A.S., &c., Professor of Materia Medica and Therapeutics, King's College.

Now complete, with beautifully coloured Plates.

In Two Volumes, Imperial quarto, half morocco, extra, price 11*l*. 11*s*.—Any of the Parts may be had separately, to complete sets.

"It is not too much to say of this very remarkable work, that it is indispensable to all who would acquire a knowledge of the vegetation, climate, and soil of the North of India."—*Athenæum*.

"No one who would be acquainted either with the ornamental, the cultural, or the medical qualities of the Indian Flora, can dispense with the possession of Dr. ROYLE's highly-valuable labours."—*Journal of the Asiatic Society of Bengal*.

"This work unquestionably contains a greater amount of valuable practical information upon useful matters than any work yet written upon the foreign possessions of any other European power."—*Dr. Lindley in Botanical Register*.

"A perusal of the very interesting letter-press, and a careful examination of the well-engraved and beautifully-coloured plates of Himalayan plants and animals, fully realize the very favourable opinion we expressed of Mr. ROYLE's Illustrations, an opinion founded on the well-known and highly-esteemed practical skill of our author as a naturalist, and his activity and intelligence as a traveller."—*Jameson's Edinburgh Philoso. Journal.*

BY THE SAME,

THE PRODUCTIVE RESOURCES OF INDIA,
Royal 8vo, cloth lettered, price 14*s*.

"It is with no common degree of satisfaction that we have scanned every page of Dr. ROYLE's invaluable volume."—*Literary Gazette*.

ALSO, BY THE SAME,

AN ESSAY ON THE ANTIQUITY OF HINDU MEDICINE,
Including an Introductory Lecture to the Course of Materia Medica and Therapeutics, delivered at King's College.
8vo cloth, price 6*s*. 6*d*.

"This very amusing and curious volume has been already so fully noticed in the different literary and medical journals, that we have only the agreeable duty of recommending it to the notice of our general and medical readers."—*Edinburgh New Philosophical Journal*.

London: W. H. Allen & Co., 7, Leadenhall-street.

Publishing Monthly, with Four coloured Engravings,
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.
The Number for April, 1842, contains beautifully-coloured figures of *Houlletia Brocklehurstiana*, *Passiflora Middletoniana*, *Torenia scabra*, and *Gesnera discolor*, with copious descriptions, history and directions for the culture of each: also Papers on the science of Gardening, No. 3; Culture of Agapanthus umbellatus; on supporting Plants by Stakes; Notices of new and beautiful Plants figured in the leading Botanical Periodicals for March, as well as of those in flower in the suburban nurseries; with an ample Calendar of Operations for April.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 2, 1842.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND having this day removed their Offices to No. 12, HANOVER-SQUARE, it is requested that all communications may, in future, be sent to that address.

London, April 2, 1842. JAMES HUDSON, Secretary.

EXHIBITION OF CAMELLIA JAPONICA, or JAPAN ROSE.

A COLLECTION of these beautiful Exotics is now in Full Bloom at CHANDLER and SONS' NURSERY, VAUXHALL.—Admission GRATIS.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.

THE GRAND ANNUAL SHOW, for 1842, of this Society, for the exhibition of Flowers, Fruits, and Vegetables, is fixed to take place on Tuesday, the 13th of September. The Annual Meeting of the Subscribers will take place at the Town Hall, Windsor, on the 19th of May.

Windsor, March 27, 1842. W. WRIGHT, Hon. Sec.

T. JACKSON, Nurseryman, &c., Kingston, Surrey, respectfully informs his Patrons and the Admirers of Horticulture, that his Supplement CATALOGUE OF PLANTS, with their prices, for 1842, and his List of Choice Show DAHLIAS, may be obtained on application.

Kingston Nursery, March 17th, 1842.

ARAUCARIA IMBRICATA. — Fine strong Plants two years old, from 5in. to 6in. high, of this most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREE are now selling at Messrs. YOUELL'S NURSERY, GREAT YARMOUTH, at 63*s.* per dozen, or 25*l.* per 100. Also Cedrus Deodora, 4in. to 6in. 63*s.* per dozen; Do. do., 8in. to 10in., 84*s.* per dozen. Specimens may be seen and orders taken at their Agents', Messrs. Flanagan and Co., No. 9, Mansion-house-street; and Messrs. Noble and Co.'s, 152, Fleet-street, London.

Great Yarmouth Nursery, March 31, 1842.

J. MITCHELL, PILTDOWN NURSERY, Maresfield, Uckfield, Sussex, begs respectfully to acquaint his friends and the public he intends sending out in May his two superb seedling DAHLIAS, viz., "SNOWFLAKE," pure white, occasionally tipped with beautiful lavender, cupped petals and first-rate show flower (strong plants the first week in May) 4 feet, 10*s.* 6*d.*; and "MRS. SHELLEY," beautiful rosy pink, cupped petals, and superior shape (strong plants the third week in May) 4 feet, 15*s.*—March 22, 1842.

CARNATIONS and PICOTEES.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL can supply the above Flowers at the following prices. Their collection is the most extensive and select in the kingdom, and for strength and healthiness are unrivalled. They beg to state that none but first-rate show flowers will be sent out.

12	pairs of fine Show Flowers,	by name	£1 10*s.* 0*d.*
25	do.	do.	do.	3 0 0
12	do.	extra fine	do.	2 10 0

Amongst which will be included a pair of that splendid Red Picotee ANACREON.—Great Yarmouth Nursery.

MYATT'S BRITISH QUEEN STRAWBERRY.

J. and W. MYATT beg to return their sincere thanks for the very liberal patronage they have received from the Nobility and Gentry, and to inform those who have not yet favoured them with their orders, that the approaching season is most desirable for planting; they can supply plants of the British Queen and Eliza Strawberry, the former at 5*l.*, the latter at 1*l.* per 100.

The unpropitious state of the weather for late autumn-planting induces them to inform those who have been purchasers, that they will be happy to reinstate any that have not succeeded, by direct application to the parties who have supplied them, such application to be limited to April. Plants carefully packed and forwarded to any part of England.

Manor Farm, Deptford, March 31, 1842.

J. KERNAN begs to inform Noblemen and Gentlemen wishing to improve the appearance of their Shrubberies, that he will forward, per post, a Mixture, including the 24 kinds of Flower Seeds recommended in the Leading Article of last week's *Gardeners' Chronicle*, for 3*s.*, and an equally suitable Mixture of an equal number, where the Shrubberies are extensive, and more diversity required, for 3*s.* Also 25 separate papers of the more modern and showy hardy Annuals, sent per post, for 5*s.* 6*d.*; the end of April and beginning of May will be found the best time for sowing; one Plant raised in the open border will make more show than six raised on heat and transplanted.

4, Great Russell Street, Covent Garden.

NEW AND SUPERB FUCHSIAS.

THE Nobility, Gentry, and Florists, are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s.* per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

THOMAS CRIPPS, FLORIST, TUNBRIDGE-WELLS, respectfully informs his Friends that Plants of the New White Fuchsia "VENUS VICTRIX" will be ready the first week in May, at 21*s.* each, with the usual discount to the Trade, if three or more Plants are taken at once. For particulars see Floricultural Cabinet for March, or Gardeners' Gazette or *Chronicle* of 5th inst. Orders for this will be received by Mr. George Charlwood, 14, Tavistock-row, Covent-garden; Messrs. Cormack and Co. New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood & Son, Maresfield Nursery; or addressed as above.

PLYMOUTH NURSERY.

ALEXANDER PONTEY begs to call the attention of the Public to his Stock of Hothouse, Greenhouse, and other PLANTS, especially to his new FUCHSIA TRICOLOR, a beautiful delicate blush white, with sepals tipped with green; a free grower and bloomer; plants of which are now being sent out at 10*s.* 6*d.* each. Also the following PELARGONIUMS:—

Lyne's Countess of Mount Edgcumbe	21*s.*	0*d.*	each.
— Diadem, a large white	21	0	—
— Peri of the West	10	6	—

The sorts named under at 60*s.* per dozen:—Amethyst, Beauty, Bridesmaid, Corona, King John, Wildfire, Inez de Castro, Nymph, Lady Douro, Prince Albert, Vulcan, Comte de Paris, Sultan, Pince's Zenobia, Jupiter, Matilda, Lifeguardsman, Apex, Wonder, Pride of the Hill. Other good sorts at from 9*s.*, 12*s.*, to 18*s* per dozen.—Plymouth Nursery, April 4th, 1842.

NEW SHRUBBY CALCEOLARIAS AND PANSIES.

MR. H. MAJOR, Knosthorpe, near Leeds, begs to announce that he raised last year thirty beautiful varieties of shrubby Calceolarias, of good form and size. The best eight will be sent out together for 2*l.* a set. The rest may be had separately at the prices marked in his descriptive Catalogue of select Dahlias, Calceolarias, Pansies, &c., which will be forwarded immediately on post-paid application. Also, strong plants of his new seedling Pansy, "Lovely Bride," are now ready to send out at 5*s.* each. The six seedlings sent out last spring for 20*s.*, viz., Glory of Knosthorpe, Princess Royal (allowed to be the best lights out), Airedale Beauty, Victoria superba, Bishop of Ripon, and Archbishop of York, all of which possess fine dark eyes, may now be had at half price. From unknown correspondents a remittance will be required with the order.

N.B.—A few packets of select Pansy seed, saved from sorts possessing the approved style of eye, may be had at 2*s.* 6*d.* and 5*s.* per packet.—April 4th, 1842.

R. JEFFRIES and SON take this opportunity of announcing to the Admirers and Cultivators of the DAHLIA, that they intend sending out in May their beautiful Seedling Lilac, "Lady Harland," which has been pronounced by all the principal growers who have had the opportunity of seeing it, as being decidedly the best Lilac Dahlia that has yet been offered. Height 4 ft., habit excellent, very thick petal, and beautifully cupped flowers, large without coarseness, on long stiff stalks, showing itself bold above the foliage. As a guarantee for its quality, it was exhibited last September, and obtained prizes at the three grand metropolitan open shows, the Royal South London, the Floricultural Society of London, and at the Grand Salthill Show. Price 10*s.* 6*d.*—Ipswich Nursery, March 31, 1842.

N.B. No orders will be attended to from unknown Correspondents without a remittance.

NEW AND SPLENDID SEEDLING GERANIUMS, PETUNIA, &c. &c.

WILLIAM WOOD & SON having purchased the entire Stock of the two undermentioned splendid GERANIUMS, raised by C. W. Fox, Esq., of Truro, beg leave to announce to their Friends and the Horticultural world generally, that they intend sending them out early in May, together with a magnificent new PETUNIA, raised by Mr. Fielder, Gardener to Wastel Brisco, Esq., of Bohemia, near Hastings.

GERANIUMS.

The PRINCESS ROYAL (Fox's), the ground white, upper petals nearly covered with a large dark spot, possesses an excellent habit, and flowers very freely, with a very large truss, 21*s.* per plant.

The DUKE OF CORNWALL (Fox's), deep Rose, with a fine light centre, beautifully marked, and a rich deep spot on the upper petals, habit good and form first-rate, price 21*s.*

W. W. & Son have great confidence in recommending the above as being first-rate show flowers of great merit.

PETUNIA.

FIELDER'S MAGNA ROSEA, superb rich Rose colour, flower very large, measuring 3½ inches in diameter, and certainly the finest Petunia ever offered to the public, price 3*s.* 6*d.* each.

The usual discount allowed to the trade when six or more of any of the above are taken; also plants of that beautiful Greenhouse Climber, HARDENBERGIA MACROPHYLLA, 5*s.* each, flowers deep blue.

W. W. and Son will likewise have ready to send out at the same time their splendid collection of DWARF ROSES in pots, consisting of the undernamed classes, and at the following prices, when the selection is left to them:

Isle de Bourbon	12*s.*	to	18*s.*	per doz.
Chinese	9	„	12	„
Tea-scented	12	„	18	„
Noisette	9	„	12	„
Climbing	9	„	12	„

Also a fine Collection of Geraniums, Camellias, and other Greenhouse Plants; Catalogues of which may be had on application. Plants will be presented gratis with each order.

Woodlands Nursery, Maresfield.

MESSRS. MARNOCK and MANLEY beg to announce to their Friends and the Public that their new and beautiful Passion-flower (Passiflora fragrans) will be ready to send out in strong plants the first week in May at 21*s.* each. A figure and description of this plant is given in the April number of "Paxton's Magazine of Botany." The seeds are supposed to have been imported from South America; and the plant succeeds best in a warm greenhouse. The fragrance of this plant is not confined to its name; it is in reality a sweet-scented Passion-flower. A drawing may be seen, and plants obtained of Messrs. Warner and Co., 28, Cornhill, and at the Nursery, Hackney.

Messrs. M. and M. having a large stock of showy Herbaceous and other plants, beg to offer them on the following terms, including Hamper and Package:—30 Herbaceous Plants, including Cypripedium, Habenaria, and other North American Orchideæ, the most showy kinds of Pentstemon, Phlox, Campanula, Statice, Delphinium, Chelone, Potentilla, &c. &c., 1*l.* 12 Fuchsias, new within the last two years, 1*l.*; 24 do. do., 2*l.* 10*s.* Verbenas of all kinds for beds, 4*s.* per dozen. Climbing Plants, for baskets in the flower-garden, such as Maurandya, Rhodochiton, Lophospermum, Clematis Sieboldii, &c., &c., 9*s.* per doz. Heaths, 9*s* to 18*s.* per doz. Geraniums, 10*s.*, 25*s.*, 40*s.*, to 60*s.* per doz. They have also a few plants left of Fuchsia glabra multiflora at 7*s.* 6*d.* each; and Hardenbergia macrophylla at 5*s.* each.

Nursery, Hackney, April 7th.

WANTS a Situation as GARDENER, a person aged 35; has a general knowledge of his business, and can produce testimonials, showing that he is capable of undertaking the management, to any extent, in the above capacity. Will attend personally on any lady or gentleman, on application to M.J., care of H. Law, Upper Clapton Nursery, Middlesex.

WANTS a Situation as GARDENER, a married Man, aged 30, who is a superior Grape Grower, and understands the management of Pines, Early Forcing, Greenhouse, Flower and Kitchen Garden. Can have a seven years' character from the situation he is about to leave. The neighbourhood of London would be preferred. No single-handed place accepted. Direct A.Z., Mr. Trotman's, cheesemonger, Lower-road, Islington.

WANTS a SITUATION as UNDER-GARDENER, a Young Man 19 years of age, who has been 5 years in one of the most respectable London nurseries, and who is well acquainted with Greenhouse Plants. His present object is to improve himself in the Forcing department under the tuition of a respectable gardener. Address, post-paid, A. B., Post-office, Clapham Rise, Surrey.

WANTS a SITUATION as GARDENER, a Single Man, 27 years of age, who from infancy has been employed in situations in various parts of England, where every branch of Gardening is carried on very extensively; with an unexceptionable character from his last situation.—Address A. B., at Mr. Whitehorn's, Horticultural Place, Turnham Green, Middlesex.—Wages 70*l.* per annum.

WANTS a SITUATION as GARDENER, a married man, 40 years of age, and of active, industrious habits, with a thorough knowledge of Gardening in all its branches, who will be highly recommended by the gentleman he is about to leave, also by other families he has served for years. Wages expected, 60*l.* a year, with a cottage.—Direct to R. R., *Gardeners' Chronicle* Office.

WANTS a SITUATION as GARDENER, a steady, respectable married man, aged 28; perfectly understands his business, no objection to manage land or cattle; can have upwards of two years' character from his last place.—Direct, A.B., Post-office, King's-road, Chelsea.

WANTS a SITUATION as GARDENER, or GARDENER and FORESTER, a Married Man, 33 Years of age, who has lived in some of the first gardens in England. Can be highly recommended for ability and sobriety by the Gentleman he has just left; as also by some of the first Horticulturists of the day. Address, Y. Z., P. Newman, Hosier, 102, Quadrant, Regent-street.

WANTED, a GARDENER, who perfectly understands his business; he must be a Married Man, and his Wife will have to undertake the duties of the Laundry.—Address, T. P., Post-office, Horsham, Sussex.

WANTED by a Young Man a SITUATION as SHOPMAN or CLERK to a Nurseryman or Seedsman, who has had considerable experience in the above capacities, having been in one of the first Nurseries in London for a considerable time, and is capable of taking the journeys if required. Reference can be given as to character and ability. Apply to A.B., Messrs. Henderson and Co.'s, Pineapple-place, Edgeware Road, London.

TO HEAD GARDENERS.—A young Man, aged 21, who has been in the garden eight years, wishes to engage himself under a Head Gardener, under whom he will be found willing to oblige, and can have an undeniable character from his present situation. Direct, stating particulars, to Andrew Maythorn, Coombe Farm, Croydon.

AS HEAD GARDENER in a Nobleman or Gentleman's Family, a Single Man in the prime of life, who is competent to undertake any situation. Has lived as Gardener and Steward, with management of Woods and Plantations. Would not object to the same situation again if required. The strictest inquiries will be answered from a family of distinction he has just left. Terms 70*l.* per annum. Address W.H., 15, Hemmings' Row, Charing Cross, London.

A GENTLEMAN who is desirous of attaining a practical knowledge of AGRICULTURE in a good Farming County, wishes to live with an experienced and independent Gentleman, who farms his own Estate, and would take pleasure in devoting some of his time to the improvement of the Advertiser. Direct, post paid, A. B., 5, Harp-lane, Tower-street, London.

FRENCH GOVERNESS.—A French Lady, competent to teach her native language, in its purity of style and proper pronunciation, is desirous of obtaining an immediate engagement as Companion to a Lady, or as Travelling Companion in a private Family or School, where her best services will be rendered to perfect her pupils. Kind and respectful treatment ensured will be taken into consideration as an equivalent for lessening pecuniary emolument. Reference for character, &c., by letter addressed to J. Legge, Esq., 37, Brudnell Place, New North Road, will meet with due attention.

WM. FOSTER, Nurseryman, &c., Stroud, Gloucestershire, invites attention to a new SEEDLING POPPY—Papaver bracteata coccinea—a brilliant scarlet. Plants now ready, 2*s.* 6*d.* each. The usual discount to the trade. N.B.—A fine collection of FLOWER SEEDS, 30 packets of good kinds, 5*s.* Catalogue of Dahlias, &c., to be had on application.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s.* 6*d.*

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s.* 6*d.*

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s.* 6*d.*

N.B. The above were considered first-rate flowers by those who saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, DAHLIAS, FUCHSIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers is now ready for delivery, including Fuchsia, Conspicua [illegible], raised by S. R. Prouse, Esq.: it is of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out an expanded bright scarlet Corolla. Pistil and Stamens rather more rosy than the sepals. Plants in May at 10s 6d. Also two new and distinct varieties of the Verbena, from Texas—Ne Plus Ultra, a clear bright pink, with a rose coloured spot surrounding the tube, which is white; a pleasing variety; colours very much resemble those of Phlox Drummondi. Elegans, a pale pink, with a delicate rose-coloured spot surrounding the tube; plants in May, the two, at 10s 6d. Likewise Dahlia, Lady Ann Murray, a beautiful mottled white tipped with bright rosy purple, a well-formed flower, with a fine centre, one of the most constant Dahlias grown, and desirable to the most limited grower, 3 feet, 10s. 6d.

Hans-street, Sloane-street, Chelsea.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties raised in 1840, and fully proved in 1841, which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season: in proof of which J. E. begs to state that he has shown above [illegible]00 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,, 24 ,, ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 18 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER. Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10s. 6d.

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10s. 6d.

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10s. 6d.

Good strong plants will be sent out the first week in May: and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

James Richardson	Richard Land	John North
John Roper	John Walker	Jas Lancelot Foste
J. Heseltine	Edward Bearpark	William West
Henry [illegible]	Robert Dempsey	John Robinson.
William [illegible]		

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant.*

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leaved Kidney, but capable of being produced in perfection for table from November till June, are now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle.*

"We can only repeat that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle*, Apr. 2.

⁂ Orders for sample baskets, enclosing 1s., will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable: it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good sized garden for one year.

Also Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, Borough.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES—Green, 1*s.* per lb.; White, 1*s.* 2*d.* per lb.; or from 2*s.* 6*d.* to 24*s.* per dozen. Cucumber Tubes, all lengths, from 6*d.* to 4*s.* each. Grape Shades, from 2*s.* 6*d.* each. Irish Globes, from 1*s.* 6*d.* each; ditto for Fountains, with solid bottom and hole, 2*s.* 6*d.* per lb.—APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars, where every description of Table Glass China is on show. Days for viewing the Works—Tuesday, Wednesday, and Thursday.

OILS, COLOURS, VARNISHES, &c.—Best Ground White Lead, 30s. per cwt.; 2nd, 28s.; 3rd, 24s. Linseed Oil, 3s. per Gallon; Turps, 4s 9d.; Dry or Ground Brunswick Green, from 1½d. to 1s. per lb.; Invisible Green, for Rough Work, 30s. per cwt.; Stone colour, 34s.; Celestial Blue, 6d. per lb.; Quick-drying Carriage Varnish, 14s. per gallon; French Polish and Spirit Varnishes, 20s; Naphtha do., 11s. 6d.; Burning Naphtha without smell, 6s. 6d. per gallon; Best Stockholm Tar, 21s. per bushel; Coal do., 10s. 6d. do.

Every description of Colour Brushes, &c., of the best quality, at the lowest prices for cash, at Nixey's, 22, Moor-street, Soho.

GARDEN NETS, Fishing Nets, Sheep Nets.—Woollen and Worsted Netting, various widths; New Hemp Net, very small mesh, Bunting, &c., for protecting blossom of Fruit-trees; New Herring Fishing Net, 1½d. per yard; Old Herring Fishing Net, ¾d. Fishing Nets of all kinds, from 4 to 400 yards long; Tarred Rabbit Fence Net, 2d. per yard; Sheep-folding Net (strong tarred cord), 4½d. per yard, 3 ft. 6 in. high; New Expanding Tents for Lawns, erected and taken down in one minute, 12 ft. by 12 ft., circular shape, 6 ft. high in the lowest part, price 5*l*.

Robert Richardson, 21, Tonbridge Place, New Road, near Euston-square.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

⁂ NUTT ON BEES (5th edition) now published.

TO BE DISPOSED OF—A NURSERY, SEED, and FLORIST BUSINESS, situated at Henley-on-Thames, Oxon. For further Particulars apply to Messrs. W. & J. Noble, Seedsmen, 152, Fleet-street, London; or to the Proprietors on the Premises.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS beg to announce that they will submit to Public Competition at the Auction Mart, Bartholomew-lane, on FRIDAY, April 14th, 1842, at twelve o'clock, a very rich collection of Carnations and Picotees, comprising Lascelles' Queen of Sheba, Ely's Lady Ely, Wood's Lord Byron, Giddin's Lady Murray, Ely's Mrs. Horner, Giddin's Venus, Wood's Lord St. John, &c. &c. Also a splendid assortment of DAHLIAS, in dry roots; Plants in bloom; Auriculas, Pinks, Heartsease, &c. May be viewed the morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

SION NURSERY.—GREENHOUSE PLANTS.

PROTHEROE and MORRIS will Sell by Auction, on Monday next, at Eleven o'clock, on the Premises, about One Mile from the "Jolly Sailor" Station of the Croydon Railway, a choice collection of the finest varieties of Geraniums, Fuchsias, Camellias, Calceolarias, and other Plants, in the most thriving and healthy condition. Also the Greenhouses, Horse and Cart, Utensils in Trade, &c. Catalogues may be had of Mr. Flanagan, opposite the Mansion-House; the "Gardeners' Gazette" Office, 343, Strand; Messrs. Minier, Strand; Noble, Fleet-street; Warner, Cornhill; Gibbs, Piccadilly; Forrest, Kensington; Bunney, Covent-garden; and of the Auctioneers, Leytonstone; who are authorised to treat for the sale or letting of the very desirable Premises by Private Contract; and if an acceptable offer be previously made, the Greenhouses and Pits, with the boiler and pipes, will be withdrawn from the Auction.

COSTLY SHRUBS, PLANTS, & ORNAMENTAL TREES, embellishing the well-known Pleasure Grounds of WORTON LODGE, ISLEWORTH; valuable Horticultural Erections of Orange house, Plant-house, Hothouse, and Conservatory, and various miscellaneous effects. By Mr. LAHEE, on the Premises as above, on Monday, the 18th April, at 12 o'clock. The Grounds, though neglected since the misfortunes of the late occupier, contain unique and beautifully-grown specimens of all the leading Ornamental Plants and Shrubs, Rhododendrons, American Azaleas, the varieties of single and double Thorns, Chesnuts, Oaks, Firs, Cedars, Hollies, Magnolias, and other Trees and Shrubs; Fruit Trees, which having been grown for removing, and transplanted every two years, and bearing abundantly, are not to be matched; Standard Roses; a quantity of Herbaceous Plants; and the entire Stock and Crop.—Catalogues may be had in a few days on the premises, and elsewhere as will be announced, and at Mr. Lahee's Offices, 65, New Bond-street.

The Lease of the Premises to be Sold.

SHIPS for NEW ZEALAND.—The Court of Directors of the New Zealand Company hereby give notice, that the Directors will be ready on Tuesday, the 12th day of April, at Three o'clock precisely, to receive TENDERS for THREE SHIPS of about 350 tons each, old register, for the conveyance of steerage passengers from the port of London to Nelson Haven, in Tasman's Gulf, New Zealand; to sail respectively on the 1st of May, the 25th of May, and 15th of June next. The Tenders to be made according to a form which may be had on application at the Company's House. The Directors do not pledge themselves to accept the lowest tender.
By order of the Court,
New Zealand House, 7th April, 1842. JOHN WARD, Sec.

THE Directors of the New Zealand Company hereby give notice, that despatches having been received from Captain Arthur Wakefield, R.N., reporting that the NELSON SETTLEMENT has been successfully planted on the south-eastern coast of Tasman's Gulf, Cook's Straits, New Zealand, preliminary ALLOTMENTS of LAND in the said settlement are now ON SALE to intending colonists and others. The district is described as containing an abundance of good fertile land, available at once for agriculture and pasture, the country being less thickly wooded than in other parts of New Zealand. The haven of Nelson forms a natural basin, in which ships may be in good shelter close to the shore.—Applications from intending colonists, and from persons of the labouring class desiring a free passage, are received daily at the Company's House, where full information may be obtained on application to the Secretary.

New Zealand House, By order of the Court,
Broad-street-buildings, March 24, 1842. JOHN WARD, Sec.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea: Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

THE following communication (translated from the German), was addressed to Messrs. Rowlands' Agent at Cologne:—

13, Straitz Enggasse, Cologne,
May 23, 1841.

Mr. Th. S. Ditges,

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For above nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial. I accordingly purchased two bottles at your establishment, and strictly followed the printed directions: in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this ackowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect.

ADAM BAUER, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey; changes Grey Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

☞ Ask for "ROWLAND'S MACASSAR OIL."

The LOWEST PRICE is 3*s*. 6*d*.; the next price is 7*s*.—10*s*. 6*d*., and 21*s*. per bottle.

In foolscap 8vo, price 1s. 6d.
COOLEY'S FIGURES OF EUCLID; being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.
*** Orders received by all Booksellers.
Whittaker and Co., Ave-Maria-lane, London.

The Gardeners' Chronicle.

SATURDAY, APRIL 9, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Zoological	8½ P. M.
Wednesday	Medico-Botanical	8 P. M.
Friday	Botanical	8 P. M.

A FEW weeks ago (p. 155) we invited attention to the method which experiment as well as theory has shown to be most advantageous in cultivating the Potato. Our readers will remember that on that occasion we particularly referred to evidence obtained in the garden of the Horticultural Society, and published in the Society's Transactions. A correspondent has now favoured us with some observations which render it desirable that further explanation should be given of the evidence alluded to. He says, "In your remarks two principles are enunciated against which I conceive no exception is to be taken; they are to this effect: 'by planting too close, the plants smother one another; by planting at too great a distance, land is uselessly wasted.' These excellent remarks are followed by certain experiments, which, however, seem to me as going to prove, in respect to the latter proposition of planting beyond a given distance, more than the proposition itself lays down; for what is that proposition? Simply this. that land is uselessly wasted. Now the rule deduced from the premises is, that, in planting, the distance between each row should be regulated as nearly as possible by the height of the haulm; and the experiments, if confined to this one point, undoubtedly establish the law. But there is a further consequence deducible from the experiments, which I am at a loss to comprehend. and which, therefore, leads me to trespass on your attention. It appears that the Early Champion Potato, the stems of which are two feet long, yielded the largest quantity when planted in rows the same distance apart. When these rows, however, were extended six inches, and made 2 ft. 6 in. in width, the produce lost was more than 8 tons; while from rows diminished in the same proportion (viz. 6 inches), the difference in production was under 2 tons; and even when the rows were only 6 inches apart, the produce exceeded by nearly a ton that which was obtained from rows which were 2 ft. 6 in. apart. From this it would appear that something more is lost than waste of land by planting in rows wider than necessary, and that every deviation from the established standard of width is unfavourable in proportion to the space given over a reduction in the space allowed; in fact, that to reduce the rows in width four times a given quantity (viz. 6 inches) is less prejudicial than to widen them by the said quantity only once applied. Is not this at variance with the theory which considerations *à priori* would lead one to establish? For it might be supposed that the evils connected with too close planting, want of air, light, and space for the supply of nutriment from the soil, would lead to the obvious result of diminished, scanty production; while it is difficult to see from the contrary process any other evil than the one you have pointed out, of loss of ground—a serious one, I admit, but still not affecting the question of comparative productiveness. Suppose the rows to have been extended from 2 ft. or 2 ft. 6 in. to 3 ft., would the decrease of the crop have kept pace in an inverse ratio?"

This appears at first sight to be a more difficult question to answer than it really is. The difference to which our correspondent adverts is owing to the difference in the weight of seed that was planted. When the tubers were two feet apart, the produce was 30 fold, only 36 lbs. having been required to furnish 1116 lbs.; but at 18 inches apart the produce was 25 fold only, 41 lbs. of sets having yielded only 1068 lbs.; and at 6 inches apart the return was reduced to 8 fold, 100 lbs. of sets having furnished only 860 lbs. of Potatoes. It was by employing an enormous quantity of sets that the greater proportional weight of produce per acre was obtained which has surprised our correspondent.

The same experiments to which we have alluded supply the answer to the question put to us at the end of the extract we have given. When the Champion Potatoe had four feet square for each tuber to grow in. its produce was only 50 fold; although when planted in rows two feet apart, and six inches from set to set, the return was 30 fold. It is, therefore, we think, plain that, try the facts in what way we will, the result is always the same, namely, that *by planting too close, produce is lost by the plants smothering each other; while by setting at too great a distance it is equally diminished, in consequence of the waste of land; and that the true distance must be determined by the length of the haulm of the particular variety under cultivation.*

ALTHOUGH for many purposes well-tempered clay is preferred to all other substances for grafting, yet it has the disadvantage of being disagreeable to use, and extremely liable to crack and fall off in bad weather. To remedy these inconveniences, various adhesive mixtures have from time to time been prepared under the name of grafting-wax, which, being spread over paper, may be cut into narrow slips and applied spirally round the junction of a graft and its stock; thus acting at once as a ligature to hold the plants together, and as a means of excluding the access of air to the wounded wood. Such preparations then act as a substitute for both clay and bast. But in practice they have not been found to answer—for two reasons: they are rarely well tempered, and are therefore either too stiff or too soft; and they require to be applied when the graft and scion are perfectly dry, any moisture preventing the adhesion of the grafting-wax. We have, however, always thought that such difficulties may be removed, and that eventually they will supersede the clumsy contrivances of clay and bast. A sample of a preparation of this sort has just been put into our hands by Mr. Daniel Edward Stephens, which, as it appears to possess the necessary requisites in a higher degree than any we have before seen, we recommend to the trial of our readers. It is composed of powdered pitch, yellow rosin, scraped beeswax, Venice turpentine, of each half-a-pound, and of 6 oz. of hog's lard. These are to be well mixed, and boiled to a head in an iron pot, great care being taken to blend them thoroughly. The mixture is then to be spread thinly, while boiling hot, with a brush, over moderately thin brown paper previously well heated and dried. If this operation is conducted with care, a kind of adhesive plaister will be formed, superior to anything of the kind we have before seen.

THE season is fast approaching when the competitors for Pelargoniums must be prepared for a contest which will probably be the most severe they have yet engaged in; for societies are increasing their premiums; the Horticultural Society alone has ordered a large tent to be set apart exclusively for these favourite flowers, and the public has become critical, and perhaps fastidious. We shall therefore take the liberty of offering a few suggestions for the consideration of those who propose to exhibit them.

Fancy-flowers, be they what they may, must be judged by peculiar rules, and not by the common standard. The great mass of flowering plants consists of species with little or no tendency to change their wild habits, further than good cultivation is capable of improving them; and therefore, with them, good cultivation is the only thing to look to: but it is otherwise with fancy-flowers. They are expressly selected by a florist, because—like horses, pigeons, dogs, bantams, and other domesticated animals, they have a strong tendency to throw off their wild appearance, and are capable of being greatly changed, and—as we think—improved, by skilful breeding. With such plants, then, high cultivation is only one of the elements of excellence; to be thorough-bred is equally necessary. This is, in fact, recognised on all hands in the case of Ranunculuses, Pinks, Tulips, and the older florists' flowers, but is generally lost sight of in Pelargoniums—a mistake on the part of judges which cannot be too soon corrected by them.

Last July (p. 470), in our remarks upon the exhibition of the Horticultural Society, we took occasion to make some observations of this kind, and to condemn some of the varieties then exhibited, as quite unworthy of appearing for prizes, considering the much greater superiority of other sorts. Twenty years ago, indeed, deep green leaves and large trusses of flowers would have been all that the highest cultivation could have arrived at; but at the present day, such qualities ought no more to settle the merits of Pelargoniums than mere bone and flesh that of a horse. High cultivation is doubtless as necessary as ever; but in addition, a flower must be thorough-bred—with the form, colour, texture, and other qualities of the petals quite perfect.

We trust the judges all over the country will take these suggestions into their consideration at the ensuing shows, and that coarse, ill-shaped flowers, only selected because they form large heads of bloom, will be put in their proper place, be their cultivation what it may. We will engage to say that in no other class of florists' flowers would such varieties as the Beauty of Ware and Lady Ann Murray be permitted to form a portion of a selection of six or twelve varieties. There can be no difficulty in picking out of the published lists a dozen varieties, infinitely superior to such as those, and perfectly free from all objections on the score of being underbred.

Exhibitors may be assured that not only judges, but visitors are much better informed than they formerly were; the good points in the flower of a Pelargonium are more generally known, and have now become a common subject of comment and discussion. It may therefore be expected, that in deciding the merits of competitors in this class, the character of each particular specimen will be a subject of very careful consideration by the judges.

IS THE MALE ASH OF GREATER VALUE AS A TIMBER TREE THAN THE FEMALE AND HERMAPHRODITE ASHES?

I AM glad that you are directing attention to improvements, which are needed, in the management of forest-trees, with a view to the production of timber. It is an important subject on which there is evidently much to learn. I have been led to make some inquiries touching the matter by a hint which I met with in Mr. Billington's work, called "Facts, Observations, &c.," viz., what are the probable effects of seed-bearing on the value and growth of wood? and whether the male Ash is more valuable than the female and hermaphrodite trees? It appears that Mr. Billington had inquired of an old experienced wheelwright whether he had observed any difference in the quality of different trees upon the best soils, supposing the size and age of the trees the same. He answered he had observed a difference in the Oak and the Ash, and this he attributed to some trees being males and others females, and that the male trees produced the strongest, toughest, and best timber. Of course he was wrong in supposing the Oaks were of different sexes, but the trees being in fruit at the time he showed which was the female Ash, and which he considered produced the worst timber. Mr. Billington says it is the opinion of others, that the male Ash makes much the largest and finest tree—that his observations do not warrant him in implicitly subscribing to that opinion, but he considers it probable that the female Ash may be inferior by bearing much seed.

In order that the nature of my inquiry may be better understood by all, it may be well in the first place to consider briefly what is the property on which the strength of timber mainly depends. It is generally known that there is a considerable difference in the value of the wood of the same tree; the heartwood is of a darker colour, much more solid, and durable than the alburnum or sapwood. And the difference is owing principally, if not entirely, to the deposition of elaborated sap, or matter of lignification, which gradually accumulates and dries in the cells and tubes. The alburnum of trees which are filled in autumn or winter is superior to that of other trees which are not filled until spring or summer. Mr. Knight says, it is at once more firm and tenacious in its texture, and more durable; and he proved that this is owing to the true sap in a concrete state which the alburnum contains during winter. When the aqueous sap rises in spring, it flows through the alburnum and dissolves in its progress a considerable quantity of the concrete matter for the support of the first emitted leaves and roots; and the alburnum in consequence becomes less solid and durable at that time. Again, it is observed that the value of the timber of different trees is materially affected by the soil and situation on which it is grown; and this, I think, may also be proved to be owing to the greater or less quantity of concrete matter which is deposited in the tissue of the wood. There is, doubtless, a particular soil and climate for which each kind of tree is naturally best adapted, and in which it will make a greater quantity of valuable timber in less time than in any other. British Oaks, for instance, thrive best in the strong but somewhat dry lands of the southern parts of England.

In a gravelly or a marshy soil in the same district, their growth is found to be not only much slower, but the timber is also less solid and durable. The quantity of moisture in a soil, and the situation as to shade or shelter, also exert a powerful influence on the value of timber. Every gardener knows the effects of a wet, cloudy summer and autumn on the quality of the young wood of fruit-trees. In such seasons it is longer jointed, more soft and spongy under the knife, and less fruitful, than that grown in comparatively dry and sunny seasons. The brighter the light to which a plant is exposed, all other circumstances being similar, the shorter-jointed and firmer will be its wood. Excess of moisture in a soil will cause a fruit-tree to produce comparatively ill-formed wood in the best of seasons. We may learn, then, from these facts, why the timber of Oak grown in a moist, sheltered valley is not so solid and durable as that which is grown on the drier soils of an open plain. Supposing I had two Acorns which, under similar circumstances, would produce plants of equal size and vigour, and supposing I planted one in the valley and the other on the plain, the former would probably produce a shoot one-third longer than the latter; and in order that the wood of both may be of equal strength, the plant in the valley should elaborate and store up one-third more of concrete matter; but the quantity of this which a plant can prepare depends upon the quality of the soil, and the number of its leaves, and the quantity and brightness of the light to which they are exposed. Now, the stem of the plant in the valley, if only one-third longer, would probably have no more leaves than that on the plain; and as the latter would have greatly the advantage on the score of light and soil, it is highly probable, if not certain, that it would elaborate and store up even more concrete matter than that in the valley. And as a similar difference will take place each succeeding year, it is very evident that there must be a considerable difference in the value of the timber grown in these situations. The heartwood of the tree grown in the valley must be less solid than that from the plain, as there must be a considerable difference in the amount of sapwood as compared with heartwood.

I will now quote one or two observations of men distinguished either for their knowledge of forest-trees, timber, or the laws of vegetable life, in support of the above remarks on the effects of soil and situation, and showing further the cause of the strength and value of timber. Evelyn, one of the best authorities on forest-trees, says, "For the place of growth, that timber is esteemed best which grows most in the sun, and on a dry and hale ground; for those trees which suck and drink little are most hard, robust, and long-lived; instances of sobriety(!)" There are some excellent observations on this point in "Barlow's Essay on the Strength of Timber." From a great number of observations and experiments he concludes, "that the best Oaks and other large trees are the produce of good lands, rather of a dry than a moist quality; the sapwood is thinner in proportion to the diameter of the trunk; the ligneous layers are less thick, but are more adherent the one to the other, and have a greater uniformity of texture than trees which grow in moister situations. The grain of the wood is fine and compact, and when they are examined with a good glass their pores are observed to be filled with a species of varnish or glutinous matter, strongly adherent; also in consequence of the closeness of their pores they are more dense and heavy, become extremely hard and resist the attack of worms." De Candolle has also observed, "that trees grown in damp places, or during wet seasons, have more alburnum than those which grow in dry places or during dry years." Duhamel assured him that in different stunted Oaks he had counted from seven to twenty-five layers of alburnum.

In some trees it is found that the thickness of the layers of wood is not the same throughout their circumference; and Duhamel and Buffon proved that this was not owing to the position of the tree relative to the points of the horizon, but to other circumstances. When on one side of a tree a good stratum of earth or a place free from all other roots is found, those roots which are directed there receive more nourishment, furnishing more to the corresponding part of the trunk, which increases more on this side. In like manner, if one side of a tree has its branches more exposed to the action of light and air, the corresponding part of the trunk grows more than the opposite. The cause of the inferiority of timber grown in crowded woods must be obvious from these facts; the roots of the trees soon interfere with each other on every side, and however good or suitable the soil may have been, it soon affords but a scanty pasture, and becomes a poor soil to them. The stems are also drawn up, and only a limited extent of foliage can be exposed to the action of air and light.

It is evident then from these various facts, that the solidity and durability, and consequently the value of timber, depends principally upon the quantity of true sap or concrete matter which is deposited within it. Will the production of seeds then by a tree tend to diminish the quantity of its true sap, and thereby affect the growth or value of its wood? A tree may be likened to a tradesman. The true sap is its trading capital, by which the whole structure of the plant and all its organs are produced and supported. The sap which it expends in the production of roots and leaves is returned to it again by their action, with, in some cases, three or four hundred per cent. interest; but fruit or seeds make no returns; instead of adding to, they cripple the growth of a plant. The sap which is expended in their production is like the capital which a tradesman expends in display, in finery, and luxuries; it is, so far as the growth of the tree is concerned, so much of its sap or capital lost or wasted. Now a certain quantity only of true sap can be elaborated by a tree under given circumstances; the more seeds and fruit, therefore, which it produces, the more sap will be required for their support, and the less will remain for the extension of roots and branches and the formation of wood. If the sap which composes the seeds had been deposited in the wood, its strength and value would evidently be increased in proportion to the quantity deposited; but if, instead of being merely hoarded in the wood, it had been used by the tree in extending its branches and roots, then the gain of the tree must have been great. Fruit or seeds then are evidently produced at the expense of all other parts of a plant. I conclude, therefore, that it is hardly possible that the female Ash can produce heavy crops of seeds, grow as quickly, and make as solid timber as the male Ash, which has no seeds to support; that is, providing they were plants of equal vigour when young, and were afterwards grown in a similar soil and situation.—*John Townley.*

(To be continued.)

KIDNEY-BEANS.

CULTIVATION and difference of climate have produced many varieties of this excellent vegetable, a few of the best of which we intend to mention, as much care is requisite in choosing such kinds as are best adapted to the different uses for which they may be designed. For example, some are runners, their stems climbing for support round branches from 5 to 9 feet high; others are dwarfs; and many hold a middle place between the two. Of some the seeds are eaten; of others, the young green pods; while in a third sort (the Mange-tout or Sans-parchemin), both pod and seed may be used, until nearly arrived at maturity. We shall also endeavour to point out to which of these uses each variety is most applicable.

RUNNERS.—*De Soissons, or Large Running White.*—Seeds large, white, and flat. This Bean, the most esteemed in a ripe state at Paris, is nothing more than the common flat White; but at Soissons it acquired a fineness of skin and flavour, which rendered it superior to the same kind cultivated in any other part of the country. A good bearer, and one of the best for late use.

Sabre.—Seeds white, compressed, often rather crooked and plump. This is perhaps the best of all, being a good bearer, and its pods of great length and size: when young they are excellent; and when nearly full-grown, they are still tender and fleshy, in which state they may be preserved for a length of time, by being cut into pieces and salted. Finally, the seed, whether fresh or dry, is equal, if not superior, to that of De Soissons. This sort grows very high.

Prédome, Prudhomme, or Prodommet.—Seeds greyish, oval, and small. This is an excellent Mange-tout, not in the least stringy, and when nearly full-grown is equally good. The seed when ripe is much esteemed. There is a yellow variety of this.

Prague or Red Pea.—Seeds round, of a violet colour. This is a very good mange-tout. The seed when ripe is rather thick-skinned, but well-flavoured and mealy, similar to a Chestnut. A moderate bearer, and late.

Prague Bicolor.—Similar to the last; seed a little larger. A good bearer, but very late.

Sophie.—Like the Prague, differing only in the seeds being whiter and larger. It is best as a mange-tout. The seeds when ripe are watery and worthless, with a thick skin; however, it might improve in a different soil. A moderate bearer, and late.

Haricot Riz, or Small White French Runner.—This variety is esteemed for its fine white seeds, which are oblong and very thin. It is a good bearer; eats well when green, but particularly so when the seeds are fresh-shelled. Some esteem them good when ripe; but we have never found them so; a difference no doubt occasioned by the soil. This sort is too tender to ripen its seeds in this country, except under a wall in a very warm situation.

De Lima.—Seeds very large, thick, and of a dirty white; pods large, short, slightly rough and wrinkled, like the Haricot d'Espagne. It is a remarkably prolific kind, and the seeds are very mealy; but it is too tender and late for this climate, where a party crop can only be obtained by forwarding the plants in a hotbed, and planting them out singly in May. It is eaten both in a green state and shelled. It grows high. We have received from America, under the name of Sieva, a variety of the preceding, a trifle earlier, and smaller.

Haricot du Cap, or Venetian Sugar.—Resembling De Lima in its chief characters, its growth and produce; the principal difference consisting in the seeds being flatter, larger, and speckled with red. An abundant bearer, but must be used young.

Haricot d'Espagne, or Scarlet Runner.—Of this there are two varieties, distinct from the common Haricot, one with scarlet, the other with white flowers; the latter is preferable for culinary purposes, on account of its greater mealiness and thinner skin. There is also a third variety with two-coloured flowers: but it is not superior to either of the above. A good bearer, but not very early.

DWARF HARICOTS.—*Nain Hâtif de Hollande, or Dwarf White Dutch.*—Pods long, narrow, and excellent when green; seeds white, small, a little compressed. Not very early in this country.

Flageolet, or Nain Hâtif de Laon, Early White.—Seeds white, narrow, rather long and cylindrical—a variety much esteemed, and perhaps most cultivated. It is very dwarf, early, good for forcing, equally suited for eating green and when the seeds are ripe. A moderate bearer, and early.

De Soissons Nain, Gros Pied.—Seeds and pods resembling De Soissons; the seeds are equally good when fresh shelled or in a dry state. In many places, different varieties are cultivated under the name of Gros Pied. A good bearer, but not early.

Sabre Nain and Dwarf White Sans-parchemin.—These two varieties are very similar; they form thick, bushy plants. In the Sabre Nain the pods are very long and large; seeds white, flattish, and rather small. These Haricots, like the Sabre Runner, are good whilst green, stringless till three parts grown, and excellent when ripe. Wet land does not suit them, because their long pods hang on the ground and often rot; but for this defect, they are excellent and very prolific; two or three only should be planted in a tuft.

Nain Blanc d'Amérique, or Dwarf American White.—Pod short, of a strong and branching habit, sometimes climbing a little, but generally dwarf, and not requiring support; very prolific; its short, swollen pod a little hooked, strongly coloured with reddish brown, particularly at the two extremities: this is not in the least stringy. The seeds are small, white, rather long, and very good when ripe; two or three only should be planted together.

Deux à la touffe.—Very prolific; pods not stringy; good either in a green state, or when the seeds, which are white, are ripe.

Of the Haricot Suisse there are many varieties, of which the principal are the white, the grey, the red, the grey Bagnolet, the Plein de la Flèche Haricot, grown particularly in the Maine; the Mohawk, lately received from the United States; and one named Le Ventre de Biche. These have peculiar characters, according to the length and form of their seeds. They are all excellent in a green state, for which they are chiefly used. The grey Swiss and the Bagnolet are sown in large quantities round Paris, either for eating fresh or for drying and preserving through the winter; the Bagnolet has the advantage of the grey in being earlier and not given to run, as most of the Swiss kinds are inclined; that of the Flèche has the same tendency; its pods are narrow and full; they keep up a succession for a long time. The Mohawk is evidently much earlier, more dwarf, and promises to be excellent, either for early or general cropping; it is good when dried. The white and red Suisse and the Ventre de Biche promise well too; the latter is, however, better in soup with its skin left on.

Haricot Noir, or Dwarf Negro.—Used in a green state, this rivals the Swiss varieties; in Touraine it is preferred for this purpose. This is one of the best for general use, and an abundant bearer.

Haricot Noir de Belgique.—This variety, introduced by M. Vibert in 1839, is perfectly dwarf, and is the earliest which we are yet acquainted with; its pods, although rather pale, are very good in a young state. With these united qualities, it will rank (at least in some gardens) amongst the first-rate Haricots.

Rouge d'Orléans.—Highly esteemed for stewing when ripe; seeds red, flat, and small.

Nain Jaune du Canade, or Flat Yellow Canada.—The most dwarf and one of the earliest Sans-parchemins, and, therefore, either good when young or when full-grown; seeds nearly round, pale yellow, with a small brownish circle round the hilum; very good when dried. A good bearer.

De la Chine, or Polish Beans.—A prolific sort, excellent either fresh-shelled or dried; seeds rather large, roundish, and sulphur-coloured. There is a sub-variety of it, with clear bronze-coloured seeds, which also appears to be good. A good bearer, and early.

FLOWER BEDS ON LAWNS.

MANY of our Correspondents are desirous of knowing what plants are best adapted for a circular or oval bed upon a lawn. Through the kindness of a friend, we are enabled to furnish them with a list of some which have been thus employed, and which produce a most ornamental effect when arranged in the following order:—In the centre of the bed a patch of the purple Phlox paniculata should be planted, around which should succeed a circle of the white variety of the same parent. Then follows a ring of Coreopsis tinctoria, after which may come one of Pentstemon gentianoides, and P. gentianoides coccineum, but most of the latter. Next plant a circle of Phlox omniflora, surrounded by one of the tallest pink sorts of Verbena; then another of the dwarfer kinds of scarlet Verbena; the outside of the whole bed being planted with Lobelia azurea. In this list the tallest plants are placed in the centre, and they are so arranged as to form a pleasing contrast; whilst the brilliancy of colour possessed by some, and the length of time they will continue in flower, renders them a striking ornament until destroyed by the autumnal frosts.

ON AMMONIA AS A MANURE.—No. III.

THERE are yet two points of great importance to be noticed with respect to the application of salts of ammonia as manures; and these are, the proportions of the fixing materials to be added to the substances evolving ammonia, and the quantity of the salts of ammonia which should be added to a given surface of land. With regard to the quantity of acid or other fixing matter proper to be added to a given quantity of gas-liquor, urine, or any other fluid containing or evolving ammonia, it is almost unnecessary to observe, that as the quantity of that substance is very variable, and depends on a variety of circumstances, it is of course impossible to give any definite rule which shall be applicable to all uses; all that can be done is to point out the object to be effected, the means by which it can be best attained, and the precautions necessary to be observed. The evolution of ammonia may generally be recognised by its peculiar pungent smell; and in all cases where dung or liquid manure of any kind exhales a pungent vapour, it is certain that ammonia is being lost: in such cases a fixing substance may be added with great advantage; if we do not add enough, the pungent smell will continue; if we add too much, the ammonia will all be fixed, and there will remain an excess of the fixing substance. If sulphuric or any other strong and cheap acid be employed, there is no fear of evil effects from a small excess of acid, because there is always abundance of alkaline and earthy matter in the soil capable of uniting with and neutralising such excess of acid, and in the diluted state in which it is applied to the soil no danger could result from its presence. In the cases where sulphates are mixed with ammoniacal solutions, it is evident that if the salt employed is insoluble in water, any excess of it could do no harm, at least in the case of liquid manures, because the excess would remain undissolved at the bottom of the tank. When, however, soluble sulphates are used, of course any excess employed will remain dissolved with the sulphate of ammonia. It must be evident that ammonia can only be fixed by mixing it with a sulphate it can decompose, that is to say, one in which the sulphuric acid is combined with a base for which it has less affinity than it has for ammonia; in this case the base with which the acid was previously combined is either set free, or enters into combination with the carbonic acid, before combined with the ammonia, and hence either the base of the fixing salt, or else the carbonate of that base, is found in place of the sulphate employed. If we were to mix sulphate of potash or soda with ammonia or its carbonate, no change would take place, because potash and soda have stronger affinity for sulphuric acid than ammonia has; but when we mix sulphate of lime, magnesia, iron, or zinc with ammoniacal solutions, they are decomposed, sulphate of ammonia is formed, and carbonate of lime, magnesia, iron, or zinc is precipitated as insoluble powder. The sulphates of magnesia, iron, and zinc are soluble in water; whilst the sulphate of lime is nearly insoluble: hence excess of the former salts would remain dissolved with the sulphate of ammonia formed, but an excess of the sulphate of lime would fall to the bottom mixed with the carbonate of lime, and hardly anything except sulphate of ammonia would be left in solution.

Practically speaking, then, the best substances to fix ammonia are either a strong acid, such as sulphuric—or if a dry salt be more convenient, then the sulphate of lime, gypsum or plaster stone, as neither the carbonate of lime formed, nor any excess of sulphate of lime taken, could have any hurtful effect when applied to land. If acid is employed, it may be added either strong or dilute, and should be well mixed with the ammoniacal liquor in sufficient quantity to destroy all pungent smell. If sulphate of lime is used, it should be broken or ground up, and added to the liquid either in a tank or otherwise as may be most convenient; it must be well agitated or stirred up, and in this case, as when acid is used, enough must be added to destroy the smell of ammonia; the carbonate and sulphate of lime left after the process may either be allowed to settle at the bottom of the tank, and the clear liquor pumped off, or the whole may be used together; but the propriety of this must of course depend on the nature of the soil to be manured. The formation of sulphate of ammonia may be effected in a very short time, either when sulphuric acid or sulphate of lime is employed; but in order to do this, the mixture should be well and frequently stirred. If acid or sulphate of lime be put into a tank with liquid containing ammonia, the formation of sulphate of ammonia goes on but slowly, unless the whole is thoroughly mixed. When enough of the fixing material has been added, and the smell of ammonia is no longer perceived, the liquor may either be directly used as liquid manure, or may be kept till required; for as the ammonia is no longer in its free and soluble state, it will not become weaker by keeping.

In situations where sulphate of lime is not to be had, or where sulphate of iron is cheaper, that salt has been advantageously substituted for sulphate of lime; generally speaking, however, it is probable that the latter salt is preferable, because about 2lbs. of it are as effective as 3lbs. of the sulphate of iron, and the carbonate of lime may be more readily separated from the liquor than the carbonate of iron. If excess of sulphate of iron is employed, it will remain in solution; but no evil results from this, for it is immediately decomposed by carbonate of lime and similar substances in the soil. The separation of the iron is greatly facilitated by exposing the liquid to the air as much as possible.

In applying salts of ammonia to land as a manure, it must never be forgotten that the quantity of that substance required by plants is not large; and that by adding a large quantity of it to the soil, we are very likely to obtain a worse crop than if we added none at all. Ammonia and its salts constitute a very powerful class of manures, and a small quantity of them produces very beneficial effects; but we must not suppose that because a little is good, a great deal will be much better.

The most economical method of obtaining and applying ammonia is to collect all the urine, drainages, &c. which are ordinarily suffered to run to waste; these fluids contain ammonia, and when exposed to the air soon become foul and the ammonia is lost: if, however, they are collected in a tank or resorvoir, and sulphuric acid or gypsum added, the ammonia is converted into a fixed salt, and the liquor may then be used advantageously, either alone or in conjunction with other manures. In all the ordinary plans for saving liquid manure, some of the ammonia is lost, because it exists in the manure in the state of a volatile carbonate: when, on the contrary, any of the previously-mentioned means are adopted, it is fixed, and further loss is prevented.—*E.*

NEW DAHLIAS.

The following are notes of some of the new Dahlias:—

Spary's Conqueror of the Plain.—A deep maroon, varying considerably in its colour; the form of the petal and general shape of the flower are first-rate, with the centre finely up.

Widnall's Princess Royal.—Bright buff, tipped with rosy purple; the flower large and finely formed. This is a beautiful and desirable variety. It gained the first prize at the Salthill Dahlia Show.

Dodds' Prince of Wales.—Yellow, inclined to become buff; a flower of good size, and well formed. This will prove a very useful show flower.

Headley's Phœnix.—This is a noble and finely-formed scarlet flower, having great depth of petals, which are finely cupped; it is slightly depressed and confused in the centre, but will no doubt form a very useful flower.

Catleugh's Lady Ann Murray.—A light mottled flower tipped with rosy purple; this is a very constant and well-formed flower, with a fine centre.

Wildman's Bianca.—White. This variety being a seedling of 1841, its character cannot be considered as fully established; but from its petal, the general form of the flower, and the goodness of its centre, there is every prospect of its proving the best white we have at present.

Jeffries' Lady Ackland.—Bright lilac; a large and very useful flower, but rather too flat.

Brown's Marquis of Lansdowne.—Dull salmon colour; a large flower, with great depth of well-arranged petals, a little depressed in the centre, and rather coarse; from the substance and form of the petal, it will no doubt be a constant flower, and prove useful for a large stand; the blooms exhibited at Salthill were very superior to those shown at the Floricultural Society of London, the latter having a faded appearance.

Silverlock's Candidate.—The blooms shown at Salthill of this variety were rather small; but the form of the flower is fine, of a deep maroon, with a well-formed petal.

A peach-coloured Dahlia of Widnall's; *Low's Duke of Cornwall*, rosy ruby; and *Whales's Attila*, rosy lilac, we have not seen, but have heard them well spoken of by those whose opinion generally coincides with our own.

AMATEUR'S GARDEN.—No. XV.

The covering of straw or litter which was recommended for the protection of tender deciduous plants, such as Fuchsias, during winter should now be removed. Upon examination it will be found that most of the plants protected in this way are perfectly safe, and are beginning to send out young shoots and leaves. These are necessarily blanched and tender, owing to their having been in the dark so long, and it will, therefore, be necessary to exercise great caution in exposing them to the frosty nights or cold winds which we may still expect to have at this season of the year. I would, therefore, recommend the amateur who has plants in this state, to surround them with a few stakes and tie a mat over them at night, or at any other time when the weather may render it prudent to have them covered. Those who have used frames made of the "Patent Asphalte Roofing" for evergreens, such as some of the fine varieties of Rhododendron, may use them now for their Fuchsias; but anything which will afford a slight protection will be sufficient. A beautiful hedge of Fuchsias, which would produce a fine exotic effect in some small gardens, might, therefore, be kept and protected at the most trifling expense, if care was taken to plant the more hardy varieties. The lovers of this favourite family will be glad to learn that there is a new species of great beauty now in flower in the country. Its name is F. splendens; the habit is good, and it produces crimson flowers, tipped with green, in great abundance. As it is from Guatemala, it is not likely to be hardy enough to stand our winters, but will probably do well enough for the flower-garden in summer and autumn.

If more room is wanted in the greenhouse or pit, strong plants of Verbenas and Petunias may be removed to a cold frame and covered up at night; in this situation they will be perfectly safe. Fires in the greenhouse will not be necessary, unless the thermometer sinks below the freezing point; give air freely, and shut up early in the afternoon if the house contains such plants as Pelargoniums; but if it is filled with hard-wooded plants, it should not be shut up so early.

A few weeks ago, a correspondent (J. L. S.) suggested the propriety of giving in the "Amateur's Garden" some plain directions for preparing fermenting material for hot-beds; and as many persons are now about to put up dung-frames for various purposes, the following directions will perhaps assist them. When the dung is brought from the stable-yard, it should be turned over, well shaken up, and thrown into a close heap. If it has not been fermenting before, it will probably be dry, and must have several tubs of water thrown amongst it—indeed, this will frequently be necessary, as there is generally some part of it too dry. Three or four days after the heat rises, it may be turned over again, taking care to mix the colder parts with the warmer, and to add more water if the heat is not rising properly. If the dung is good, the whole mass will soon be in a state of fermentation, and after remaining in this state for three or four days longer it will be fit for making into a hotbed. The quantity required varies of course according to the objects of the gardener and the size of the frame to be placed upon it: a bed about five feet in height answers the purpose very well, but less than that will do for many things. In making it, shake the dung well, beat it down regularly all over the bed with the fork, place the shortest on the top, and then put on the frame. If it is intended for cuttings, cover the inside over about two inches with rotten dung, and leave a little air at the back to allow the rank steam to escape. The frame must then be examined daily, and as soon as the bed is "sweet" (as gardeners say), the cuttings may be introduced. A little practice is necessary in order to determine this; but the safest way for every one is, to put in a pot of cuttings of some plant which they do not value and see what effect is produced upon them; this will give them practical knowledge. These remarks are only intended to assist the inexperienced in making a common hotbed, and are not to be understood as recommending this particular kind of bed either for economy or neatness.—*R. F.*

Erratum.—In Amateur's Garden, No. 14, in the list of Chrysanthemums, *Lacidum* should be read *Lucidum.*

HOME CORRESPONDENCE.

Cherry grafted on the Laurel.—In No. 12 you answer an inquiry of "Speculative," that you are not aware whether the Cherry will bear when grafted on a Laurel. There is an instance where a Mayduke was budded on a common Laurel, the fruit of which I ate last summer; it was most excellent in flavour, and both the Cherry and Laurel grew very luxuriantly; the former bore very freely each year.—*W. B., Clericus.*

Shrivelling of Grapes.—In the *Gardeners' Chronicle* of the 19th inst. there was an article from Mr. Fish on the shrivelling of incipient bunches of Grapes in an early forcing vinery. I think Mr. F. should explain his system of treatment from the commencement of forcing up to the time the fruit is ripe, and likewise the state his wood was in at the end of the season (September and October). If Mr. F. had done this as well as giving us the weight that is required to bring the incipient bunches to perfection, it would give every practical gardener an opportunity of proving whether his system is a good one or not. The plan laid down by him has been thoroughly examined by many practical gardeners and condemned, the general opinion being that it is theoretical and not practical. Mr. Fish must have been very unfortunate in his places to have to superintend Vineries with cold and deep borders, which, unless properly managed, will cause a failure of crop. I feel satisfied by experience, that gravitation will not insure a full crop, nor save the incipient bunches from shrivelling without good management. My Vineries have deep, wet, and cold borders: I have had many bunches this season which, like his, have threatened to run away; but the laps of glass are so close in my Vinery, that they could not find the way to escape. By a little good management I have brought them out to great perfection, and they will be ripe in a short time. I think this year's practice will give me an opportunity of proving the real cause of shrivelling in all its points, and likewise its remedy, which, when obtained, I shall lay before the readers of the *Chronicle.*—*An Angler.*

The Vine.—A correspondent strongly recommends Hoare on the Vine as a prize-book for cottagers. He considers it a very interesting book, and one that no one can fail to understand. We entirely agree with him. Anybody who will study what Mr. Hoare says *must* manage Vines well on open walls.

The Impregnation of Cucumbers.—Since you seem to have your doubts as to Mr. Ayres' capability of producing Cucumbers without fertilisation, allow me to say that upon that subject I can go beyond him. Some years ago, as I was pegging down my plants, I unluckily broke the flower off the fruit at least four or five days before it would have expanded, for which I felt sorry, as there were no other fruit-blossoms showing at the time. I left it, however, and, to my agreeable surprise, it swelled off as handsome a fruit as any I had during that season. This does away with all impregnation. From that time I never gave myself the least trouble respecting it, unless when I wanted to save seed, which I am firmly persuaded, according to the common course of nature, cannot be obtained without it.—*John Kyle.*

Mice.—On visiting a garden in which the Crocuses were eaten by mice, I was pleased at a simple and effectual mode of destroying them. A stone pickle-jar was sunk in the earth, the inner rim being smeared with dripping or suet, and the vessel half filled with water. I need not add, that many of these pests to the gardener were drowned by falling over in their attempt to reach the bait. —*N. S. Hodson.*

Rooks.—On April 29th, last year, I got 24 rooks, not full fledged, from a neighbouring rookery. I made nests for them, and put about five in each. I procured the trellis from an old summer-house, covered the top with tarpauling to keep them dry in wet weather, and fixed a table in the middle to feed them upon. Liver and Potatoes I found the best food for them—Oatmeal proving too heating, and I lost some from using it. I fed them every two hours till they began to pick; but when they could fly well, I fed them but twice, and afterwards only once a day. I continued this treatment until September, when I thought they would feed themselves; but this would not do, for they soon began to leave me, and in a short time my stock was reduced to six. I now determined to feed them all the winter, and still upon the table in the shed; I did so once a day the whole of the winter, and not one left afterwards. They have this morning (April 5th) commenced building for the first time, which will be thought late; but I believe young rooks do not begin so early as old ones, and this is a very cold situation, being on the verge of the moors.—*Ridgmont, Bolton-le-Moors.*

Rookeries.—In "A Familiar History of Birds," by the Bishop of Norwich, he says, "It has been said that by exchanging a magpie's eggs for rooks you may obtain a rookery." Last year I placed eight rooks' eggs in a magpie's nest in a plantation about a quarter of a mile from the house; the magpie reared six young rooks, and always brought them to roost in a small plantation at the end of the lawn, close to the house; this spring the rooks were frequently observed to be fighting with a pair of magpies, which they eventually drove away. The rooks have established themselves in this plantation, having completed four nests and commenced a fifth. The trees are not above 35 years old, chiefly Elms.—*G. W.*

On the Habits of Birds.—In several of the late Numbers of the *Gardeners' Chronicle* I have observed notices connected with Ornithology, which I think should be so classified as to make them serviceable to the purposes of general science. The natural family of Silviadæ, or Summer Warblers, offers as fertile a field for observation as any; and their habits and localities bring them more immediately under the eye of the gardener than any other tribe of birds, many of the species being peculiarly the inhabitants of gardens, which they enliven with their sprightly habits and delightful song. They are a class, also, but little understood; and the partial limits of their annual migrations is a matter of interesting speculation: take, for example, the Nightingale, which winters in Northern Africa, and extends its summer migrations over the whole of central Europe as far north as Russia and Sweden, including the south-eastern counties of England, but most unaccountably omitting all to the west of a certain line, which excludes the mild and wooded valleys of Devonshire and South Wales, localities which would appear peculiarly favourable for their resort. Again, Salicaria turdoïdes, a bird of passage, which is common on the opposite shores of France, has never been known to cross the narrow channel which separates us, and is not included in the British Fauna. Another singular fact connected with the natural history of this tribe is mentioned in Mr. Yarrell's invaluable work on British Birds. In speaking of the Willow Warbler, he says—"Col. Montagu states that at the date of his observations the bird did not go so far west as Devonshire and Cornwall; and there is no reason to suppose that he was mistaken; but, from whatever cause it may arise, it has now become a constant visitor to Devonshire and Cornwall, and has been even found on the west coast of Ireland. No reason for these strangely limited migrations has been assigned or attempted, but an extended system of observation carried on through a series of years might perhaps supply facts which would lead us to causes (as, for example's sake, the absence or presence of certain plants or insects) which influence these birds in the choice of their summer retreats. I would then suggest that some of your correspondents should carefully distinguish the various species of Silviadæ which are to be found in their respective neighbourhoods, and keep a register of these, together with the date of their arrivals in the spring, for which their daily walks and occupations in the garden would give them abundant opportunities. The only obstacle to this plan is the difficulty which any but a practised ornithologist would find in discriminating between species which are nearly allied, and unmarked by any obvious differences of form or colour; but this difficulty might be met by publishing a list of our English Silvias, with their distinctive specific characters described as familiarly and prominently as possible, and then should cases of doubt still exist, specimens might be killed, and the species accurately determined.—*J. D. Llewelyn, Penllergare.*

Application of Ammoniacal Liquor.—Having read your several articles in the *Gardeners' Chronicle* on the application of ammoniacal liquor, and also your critiques on Mr. Daniell's new manure, I send you a description of my method of applying it, which is similar to that you recommend for the formation of an excellent compost either for agricultural or horticultural purposes. I make a bed or substratum of any coarse earthy matter one foot thick; upon that is spread a layer of vegetable remains two feet thick, consisting of leaves, edgings, rushes, couch grass, or other noxious weeds (which are too often thrown on the sides of fields, and thence carried on to the land again by sticking to cart-wheels or other conveyances); the whole is then watered with ammoniacal liquor from the gas-works; in a few days I put another layer of earth, then a layer of vegetables, and water as before; another layer of each may be added if convenient, or the clamp may be covered up at once with earth, to keep in the volatile matter and throw off the rain. The whole will require turning over two or three times before using, as some vegetables are a long time in decomposing; but a farmer should always have a succession of these clamps—one ready for use, and others in a state of formation, as receptacles for all the rubbish on his farm. If lime can be readily obtained, I should recommend one layer turned in the last time before being used.—*C. J. Holcombe.*—[Lime would disperse the ammonia. Better use pounded gypsum.]

Cape Bulbs.—In looking over the "Botanical Register," I find the Editor has published a figure of my Amaryllis Banksiana, and to the description annexed an abstract from Mr. Herbert's work on Bulbous Plants. Though I must differ with great reluctance, as well as diffidence, from so high an authority, and from an author to whom I am indebted for most of my information on this subject, yet, as far as my experience goes, Mr. Herbert's directions to keep the bulb under ground are certainly unnecessary; and the plan of burying the bulbs is objectionable, on account of the greater difficulties of management, from the increased size of the pots. I have had two bulbs of Amaryllis Josephinæ nearly twenty years, both of which flower every season, both of the bulbs being two-thirds out of the ground, and yet they are as firm as onions and as large as a child's head. I am not aware that I ever lost a bulb from being exposed, though no doubt bulbs may be placed too high, as it is not natural for them to grow without some degree of covering, and particularly Brunsvigia ciliaris, which is very liable to bleed. I attribute my success in the management of Cape bulbs entirely to the plan of plunging the bulbs, during their period of rest, in a pit filled with pure sharp sand, the necks being covered. The lights are then put on, and little air given; the sand often becoming quite hot to the touch from the action of the sun. The bulbs are thus well ripened, and the roots at the same time protected and kept cool.—*J. W. Slater, Newark Park.*

Potatoes.—Fearing I might have been in error about Mr. Knight's crop of Ash-leaved Kidney Potatoes, as recorded in the Hort. Trans., vol. vii., p. 405, I have again referred to the paper, and quote from it: "Of this variety I selected in the present spring the largest tubers which I could cause to be procured in the last year; and I have planted them nearly in contact with each other in the rows, and with intervals, on account of the shortness of their stems, of only two feet between the rows." From this you will perceive that I was rather under than over the mark in my estimate of the quantity of seed planted in that experiment. Should you think it right to state as much in your valuable Paper, it may prevent misapprehension in those of your readers who may not have access to Mr. Knight's paper. If Mr. Knight used "the largest tubers which he could cause to be procured," my calculation will surely fall far short of the actual weight of the seed used on that occasion.—*Lusor.*

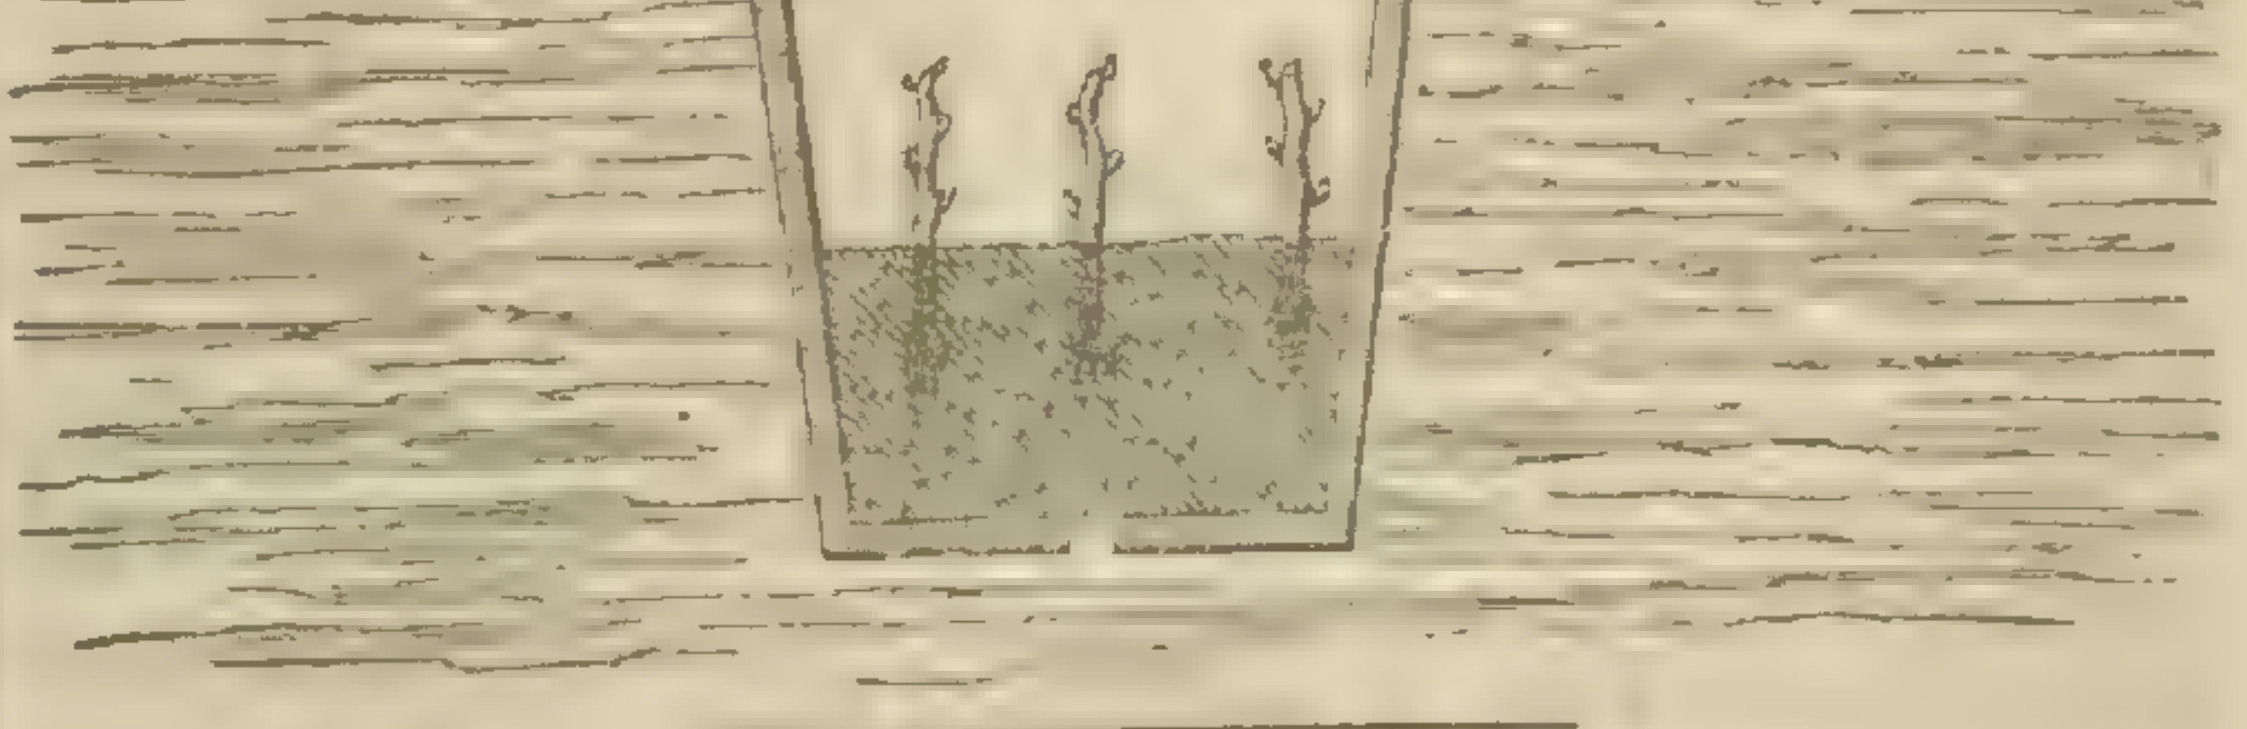
Wheat in the West Indies.—There is an error in Dr. Hamilton's paper on the culture of Wheat in Bermuda, No. 4, p. 53, which I hoped some other correspondent would have corrected. Dr. Hamilton assumes, in his calculation, that a bushel contains 512 pints! In my school days it only contained 64, but the bushel has been altered since then! Dr. H. is pretty near the mark in stating 785,400 grains of Wheat to the bushel; but in that case the pint would contain 12,272 grains. If, as he assumes, each grain would have produced 55 ears, and each ear 65 grains (but which I think a rather unreasonable expectation, from Wheat that ripens in 90 days after sowing, and which consequently cannot be expected to tiller like our winter Wheats, which very rarely indeed produce 55 ears from one plant), the product of grain would be 43,872,400 grains, or 5,585 bushels, instead of 10,474, as he states it. His calculation of the returns from Mr. Fox's pint and a half requires the same correction; the pint and a half would contain 18,408 seeds, and if each seed produced three ears, each containing 52 grains, the produce would be 2,871,648 grains, or 3·65 bushels.—*Lusor.*

The Currant Fly.—Pray tell your readers to bestir themselves. Two of the Nematus trimaculatus (see p. 548 of 1841) were observed this week, and both females. It is therefore time to apply remedies, as the eggs are no doubt already being deposited on the young leaves.—*R. R.*

Glue-water for Scale Insects.—In a previous *Chronicle* I saw glue-water recommended for the destruction of white scale. I tried the experiment last year upon a few plants, several of which it killed without destroying the scale. The remainder are very sickly, so that in fact the remedy is worse than the disease. I used it milk-warm, immersing the heads of the plants three or four times as they became dry, mixing 10lbs. of glue to 10 gallons of water. I kept the plants quite dry above for a week or two, until I began to see them looking sickly; I then brought them out into the open air, and syringed them twice a day, which served merely to disolve the glue, instead of peeling it off as I expected.—*John Kyle.*—[It never was intended that plants should be smothered in glue-water; but that the size should be painted over the parts affected by the insects. Mr. Kyle's plants must have been very dirty to have rendered his operation necessary.]

FOREIGN CORRESPONDENCE.

Paris, 30th March, 1842.—In one of my former letters I have incidentally noticed the extent to which Roses of all descriptions are cultivated in France, but I am not aware that the manner of propagation, for which the florists here are so justly celebrated, has yet been adverted to. It is a matter of notoriety that this tribe of plants, especially the Chinese varieties, are here multiplied with a rapidity and facility unexampled in any other country; for example, a florist who bought one of Mr. Laffay's new Roses last autumn, informed me the other day that he had now more than 50 of it for sale. Mark, these were all produced during the winter, and this is no solitary case. That fine new English Rose, Devoniensis, was received here last autumn, and may perhaps be in the hands of four or five persons, but I feel confident that they will increase it with such rapidity as to be able to offer it to the trade in England at a much lower price than it can be purchased there. Your readers will naturally ask how it can be done; some may suppose that rents and labour are cheaper here. This is not the case, for I believe both to be even higher than in England. A mere hovel, with an acre of garden, near Paris, is worth from 400 to 500 francs (16*l.* to 20*l.*) a-year. A labouring gardener earns 15f., and a propagator and foreman from 20f. to 25f. a week. The climate is without doubt propitious, but the principal cause of success is in the attention specially bestowed during the period of propagation, and the daily observation and regulation of heat, moisture, light, air, and cleanliness. The hot-water system is as yet but in partial operation; nevertheless, under the old plan of tan and flues, cuttings often root in 6 or 7 days. All the tender kinds, such as Bengales, Thés, Noisettes, and Isle de Bourbons, are propagated by cuttings and leaves perpetually, and Hybrids between them are also raised in the same manner, but not so expeditiously as by grafts. The bottom heat, whether by tan or hot water, is kept as nearly as possible at 25° Reaumur (88° Fahr.); the compost in general use is equal parts of peat and white sand. Some use a kind of black sand, which is found to answer very well; this is shaken down rather firmly in the pot, and the leaves or cuttings planted just below the surface, and sometimes even laid upon it; particular regard is necessary to this, because much of the after success depends upon the way in which this is done, for experience has clearly proved that subjects thus treated will root much sooner than those planted deeper; another advantage is, that they are not so liable to fog. They are then plunged in the tan or bed, and bell-glasses tightly placed over them, so that the full benefit of a close, humid atmosphere may be imparted. Every third or fourth day they are slightly syringed; immediately the roots appear they are repotted in thumbs, one-fourth leaf-mould being added to the former compost, and again plunged as before; in about a fortnight they will be sufficiently advanced for removal to other glasses, when air is freely given, and are thus hardened off for either frames or the open ground. The cuttings are always taken from young wood, but care is necessary to ascertain that it is sufficiently ripe, otherwise loss is sure to follow. Leaves may be taken from wood somewhat older, but the eye must not be injured, and a portion of the rind both above and below attached to it; these form plants quite as fine as cuttings, and within nearly the same time. During the first and second stages of this operation, the houses are entirely shaded from the sun, either by thin canvas or whitewashing the glass inside: it is of the first consequence to attend to this, because however necessary light may be as a stimulant, yet if allowed too much power it will assuredly prove highly prejudicial. Cleanliness is also considered as necessary as heat or light; the bell-glasses are kept constantly clean, by being wiped out every two or three days. If the least impurity is allowed to generate, the plants soon become sickly. A pure atmosphere is quite as necessary for vegetable as animal life; both may exist, but neither can thrive without it. Herein consists the superiority of French propagators, and the mea y which they are enabled to supply the world with Roses and Camellias at a rate so much cheaper than other countries. Some of the florists in Paris have a way of striking cuttings which I have not observed elsewhere; it is this—large upright pots, similar to those used for Hyacinths, but about six or eight inches across, are half filled with compost, and the cuttings planted in them. They are then plunged in tan nearly to the brim (see figure), and a flat glass placed upon the top: by this means a more even heat is said to be imparted, and the rooting is performed in less time.



PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

April 5.—Sir O. Mosley, Bart. in the chair. Dr. W. H. de Vriese was elected a foreign corresponding member. From Mr. Goode, gr. to Mrs. Lawrence, there was a large collection, including two magnificent specimens of Heaths, linnæoides and melanthera; a large handsome plant of Epacris impressa; Blétia Shephérdii, with spikes of crimson-purple flowers; Oncídium pulchellum, with a spike of delicate pinkish-white blossoms; Tropæolum brachyceras, trained over a frame, presenting a mass of bright yellow. Several cut Camellias, and a cut specimen of Combretum macrophyllum, were also sent from Ealing Park. A Knightian medal was awarded for the Oncídium, the Heaths, and the Epacris. Mr. Jackson exhibited 6 fine specimens of Heaths, among which the rare élegans and the hail-like grandinosa deserve particular notice: a Banksian medal was given for the former. A certificate was awarded to Mr. Standish for Zíchya villosa, a recent introduction from Swan River, well worthy of cultivation. Mr. Toward exhibited Billbérgia zebrina, a singular fine-looking plant with banded leaves and green flowers with crimson bracts. Mr. Hopgood sent two specimens of Physolóbium carinatum, a pretty dull crimson pea-flowered plant, and Zíchya dilatata, a kind somewhat resembling Z. coccínea. Mr. Ivery exhibited several fine seedling Cinerarias; the most remarkable among them was Rival King: its habit is dwarf and compact, and the flowers are white tipped with bright crimson: a certificate was given for it. Mr. Gaines sent a collection of Heartsease, and a seedling Rhododendron named Prince of Wales; it is delicate blush with numerous dark brown spots in the throat. From Messrs. Young was a new species of Siphocámpylus, with brown heart-shaped leaves and bright scarlet flowers. Mr. Slater, gr. to J. Spooner, Esq., exhibited a small specimen of the Waratah, Telópea speciosíssima, the beautiful Enkianthus quinqueflorus, and some seedling Cinerarias. There were two fine plants of Andrómeda floribunda sent by Mr. Marnock, from the Royal Botanic Gardens; this is well worthy of cultivation on account of the freedom with which it flowers, and for its hardiness. With these a variety of Phycella ígnea was sent. Mr. Pearson exhibited a seedling Camellia; it was a striped variety, but not sufficiently distinct from some already cultivated. Messrs. Chandler sent Camellia Albertus, a handsome striped variety; and serratifólia, a singular kind with dull red flowers, having a whitish stripe in the centre of every petal. There were also collections of Camellias from Mr. Redding, gr. to Sir J. D. Broughton, Bart., and J. Allnutt, Esq. J. Willmore, Esq., sent a specimen of a new species of Peristéria from Porto Caballo; it produces numerous very large flowers of a reddish-brown or mahogany colour: a Banksian medal was awarded for it. Mr. Horley, gr. to G. C. Legh, Esq., sent Maxillária variábilis, a species with small inconspicuous white flowers. There was a fine collection of Roses forced in a pit heated with Arnott's stove, from Mr. Rivers; there were about 25 kinds, chiefly the same as those mentioned in p. 192: there was also a collection from A. Rowland, Esq. Mr. Brown sent a tray of flowers of a seedling Heartsease named Countess of Orkney. Mr. Appleby, gr. to T. Brocklehurst, Esq. exhibited specimens of a variety of Oncídium lúridum from Demerara; a Blétia, and Phaius Wallíchii; with them was an Enville Pine weighing 2 lbs. 5 oz. From Mr. Henderson, gardener at Coleorton hall, near Ashby-de-la-Zouch, was a well-ripened bunch of Black Portugal Grapes, for which a certificate was awarded; it was grown on a plant raised from an eye, on which six or eight other bunches are allowed. Mr. G. Mills sent a handsome brace of Cucumbers 21½ in. long, grown in his improved pit: a Banksian medal was given for them. H. Kemble, Esq. exhibited some Old Golden Pippins, and a New Town Pippin: and from Mr. E. Denyer there were a seedling Apple, and some Winterthorn Pears. Messrs. Chapman sent a sample of their "new" Potato. From Sir J. T. Tyrrell, Bt., M.P., there were four remarkably fine Cabbage Lettuces grown in the Dutch manner: a certificate was given for them. There was a large collection of plants from the Garden including Fuchsia splendens, a new species sent home by Hartweg; it has brighter flowers than F. cordifólia, and is likely to prove a valuable addition to our collections. The others more worthy of note were Acanthophíppium bícolor, with numerous waxy crimson flowers; A. sylhetense, with paler blossoms; several elegant Acacias; and a variety of showy Cinerarias. There was a box of cut flowers of Camellias grown in pits, having no other protection than a mat over the glass in severe weather; among them were splendid specimens of C. reticulata.

FLORICULTURAL SOCIETY.

April 5.—Mr. Woodman in the chair. Mr. Bowley was elected. Mr. Groom gave a slight sketch of the history of the Tulip as a florists' flower. He commenced by saying that he doubted whether our garden varieties were derived from the Túlipa Gesneriana, as that species has plain red pointed petals, and badly-shaped flowers. He then noted the different periods and prices at which some of the finest sorts were offered to the public, commencing with an old Catalogue of J. Maddocks of 1772. At this period double Tulips were nearly unknown, and the few cultivated are still retained, while many of the single varieties have been lost. Charbonnier was sold at that time for 5*l.* In 1780 Roques's Black appeared, supposed to be the first English-raised variety; at this period Bizard is first found instead of Bizarre. The principal year of introduction seemed to be 1788. The price of Roi de mine d'Or in 1789 was 10 guineas. In 1793, Holmes's King is first mentioned. In 1797, the number of Bizards exceeded that of the other classes by 100. In 1800, the price of Imperatrix Florum was 30 guineas; of Louis 16th, 15 guineas. In 1809, Titian sold for 50*l.*; Dowager Countess of Aylesbury, 100*l.*; Gloria Florum suprema, 300*l.*; and in 1818, Joie de Davey is quoted in Davey's Catalogue at 500*l.* Mr. Groom next mentioned the properties of a good flower; it should be composed of 6 petals, three outer and three inner, which should be alternate and lie close to each other, broad and round on the top, quite smooth, and of sufficient width to allow the edges to lie over each other when fully expanded. They should be firm in texture, having a slight swell towards the lower part of the midrib of the petal, which will enable it to retain its shape; this in a fully-expanded flower should be a semi-oblate spheroid, the stalk being inserted in the pole, which should be a little depressed. The petals should be level on the top, the inner three of the same height as the outer; the latter should not be bent back, as is the case in some flowers. The colour of the ground should be pure and rich, the base of the petals without stain, and the yellow ground should possess the same intensity of colour on the outer as on the inner side of the flower. In the three principal classes, namely, Roses, Bizards, and Byblœmens, the colours should be brilliant, well defined, and not liable to flush, which occurs in consequence of the confined damp in the stages at night. In Mr. Groom's opinion the feathered flower was most preferable; the feathers should commence at the bottom of each petal, the deepest marking being on the top, and equal in every one. The flamed flower should likewise possess this feather, with a rich beam up the rib of each petal, branching off on either side, touching the feather, and at the same time preserving sufficient of the ground colour to show it to advantage. A flame without a feather in general presents a star-like appearance, which though not so correct as the other, is still beautiful. The stem should be elastic, neither too tall nor short for the size of the flower, and sufficiently strong to keep itself erect without support.—The adjourned discussion on the properties of the Auricula was postponed till the next meeting, when it will take precedence of the discussion on Mr. Groom's paper on the Tulip.

LINNEAN SOCIETY.

April 5th, 1842.—Robert Brown, Esq., in the chair. Sir O. Mosley, Bart., and Mr. J. Griffiths, were admitted Fellows. Mr. Kippist was elected an associate. The President announced to the society that they had the pleasure of the company of two distinguished French botanists, MM. Ach. Richard and A. de Jussieu. A letter was read from the Secretary of Prince Albert, in answer to the address of congratulation to the Queen and H.R.H. on the birth of a Prince. Specimens of Crocus vernus were exhibited by Mr. Flower, which had been gathered in the vicinity of Hornsey Church. A paper was read on several new species of Spiders, with an account of their habits, by John Blackwall, Esq. Some of the species were remarkable as having been found at the Universities of Oxford and Cambridge, and in no other part of the country. The Secretary announced that in pursuance of the bequest of the late David Don, Esq., the society had received his herbarium, as well as a collection of hard fruits and sections of wood. The latter were exhibited, amongst which we observed the following: Fruit of the Brazil-nut (Bertholetia excelsa), the Chocolate-nut (Theobroma Cacao), the Baobab (Adansonia digitata), the Monkey-pot (Lecythis); also the fruits of species of Pekea (Saouari-nut), Swietenia, and the various species of Banksia; a very fine cone of Pinus Sabiniana, and the fruit of Tanghinia venenifiua, the Malagash Poison-tree; a spadix of Encephalartos horridus. Of the woods there were sections, transverse and horizontal, of the Cork Oak (Quercus Suber), of Casuarina equisetifolia, a species of Vitis with two centres of growth, and fine specimens of the woods of Banksia, Dicksonia, Calophyllum, and several unnamed New Zealand trees.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

VANDA CRISTATA. Crested Vanda. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—This has flowered with Messrs. Rollissons, of Tooting; not, however, very perfectly, for the flowers are greenish instead of being nearly white, and they are solitary instead of being on three-flowered peduncles. It is a pretty species, from the warm valleys of Nepal. The sepals and petals were greenish, the lip yellow, striped with rich purple asperities and furrows; at the point it is divided into two acuminate lobes.—*Bot. Reg.*

ARUNDINA DENSA. Dense-flowering Arundina. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—A beautiful Orchidaceous plant from Sincapore, sent to Messrs. Loddiges by Cuming. It has flowers as large as those of A. bambusifolia, rosy violet, with a crimson-bordered lip, sweet-scented and very handsome, forming a close head, and not a long loose raceme.—*Bot. Reg.*

ECHEVE'RIA RÓSEA. Rosy Echeveria. *(Hardy Herbaceous Plant.)* Crassulaceæ. Decandria Pentagynia.—A Mexican herbaceous plant, imported by Messrs. Lee and Co. of the Vineyard, Hammersmith, and by them presented to the Horticultural Society, in whose garden it flowered in April 1841. From E. gibbiflora its short compact inflorescence distinguishes it, as well as the yellow flowers with rose-coloured bracts, which render it very gay. There is indeed but one species yet described in which the corolla is yellow, and that, being the old E. cæspitosa, is a quite different stemless plant. It is a pretty greenhouse plant, requiring the same management as Crassulas and succulents of that kind. It does best when grown in a very light house, and the leaves, bracts, and flowers acquire that deep colour which is so beautiful in some of the species of this family. It strikes readily either from leaves or from cuttings, and should be grown in a light and well-drained soil.—*Bot. Reg.*

ACHIMENES LONGIFLORA. Long-flowered Achimenes. (Greenh. Peren.) Gesneraceæ. Didynamia Angiospermia.—No individual, whether potentate or commoner, no Government, no association of individuals in any country, ever embellished their native land, in the same number of years, with such a multitude of rare and beautiful plants as the Horticultural Society of London has brought into England, either through their correspondents, or by the means of their collectors, among whom the names of Forbes, Parkes, Douglas, and Hartweg stand pre-eminent. The annuals, the perennials, the hardy deciduous shrubs, the evergreens, the creeping plants, the greenhouse and stove plants now in cultivation, have principally sprung from the rich mine in the Society's Garden; and now, after 20 years' importation of novelties, here is one which yields to nothing except the Wistaria (Glycine sinensis. More beautiful than the gayest of our stove herbaceous plants, as easy to cultivate as the commonest of perennials, more prodigal of flowers than the finest of the Gloxinias, ever blooming, except during the few months when it sinks into its winter's rest, this Achimenes longiflora is an invaluable gift by the Society to every one who has a warm greenhouse. The following excellent account of it by Mr. Fortune, published in the Transactions of the Horticultural Society, gives full information concerning its history and treatment: "Mr. Hartweg found it growing wild in the ravines of Guatemala, and sent its roots home last spring along with several other new Gesneraceous and Orchidaceous plants. The roots arrived in very good order, owing to their having been packed in dry loam, and sent home at that period of the year when the plant is naturally in a resting state. In packing and sending home plants of this kind, much of the success depends upon having them gathered and transmitted at the proper season. In this case, the roots being gathered after the growing season was past, and at the same time surrounded with dry loam, were as nearly as possible in natural circumstances during the voyage to England, and were only enjoying that period of rest which they would have had in their native country, being, as the event proved, as ready to start into leaf and to grow with vigour after their arrival as if they had remained in Guatemala. The stems of Achimenes longiflora are of two kinds, some creeping along the ground and amongst the soil, and forming fibrous roots and numerous imbricated buds resembling scaly bulbs; others growing in an upright position from a foot to two feet in height, branching and covered with short spreading hairs. The leaves are hairy, generally opposite and in pairs, but on young shoots are frequently in whorls of three and sometimes alternate. They are oblong, pointed and serrated, green above, but tinged with red on the under side when fully grown. The flowers grow singly from the axils of the leaves; the peduncles are about half an inch in length; the lobes of the calyx are green, oblong, pointed, and persistent. The tube of the corolla is about 2 inches long, and the border nearly 2½ inches in diameter, 5-lobed and nearly round, having much the outline of a good Heartsease. The tube is of a dark cream colour, the border purple or deep blue changing into lilac. The style and stamens are about the length of the tube, but the latter are apparently much shorter, owing to their being spirally curved at their base. It proves to be a plant of the easiest cultivation, flowering in August, and continuing covered with large violet flowers for three or four months. It seems to flourish in any free soil, and is more easily propagated than any plant with which I am acquainted. In the spring, when it begins to grow, this can be done by separating and potting the scaly bulbs described above; afterwards its creeping stems will strike their roots into the soil, and can be taken off perfect plants; and at all times while the plant is growing cuttings may be struck in a few days."—*Bot. Reg.*

THUJA FILIFORMIS. Weeping Arbor Vitæ. (Hardy Evergreen Tree.) Coniferæ. Monœcia Polyandria.—There is a general belief that this rare plant is the same as the species figured by Mr. Lambert under the name of T. pendula; and accordingly by all writers upon Coniferous plants the two are mixed together. I confess I do not participate in this opinion. It appears that the fruit of T. pendula is four times as large as this, and has six scales instead of four, with scarcely any mucro; while in this there are constantly four scales only, and they have a mucro almost as long as themselves. Now a difference of this kind is too important to be disregarded, and is scarcely to be considered as accidental. I therefore adopt Mr. Loddiges' name of T. filiformis. It is a beautiful and quite hardy tree, with long slender weeping branches. The finest plant in England, or perhaps in Europe, is in the Arboretum at Kew; it is now 8 or 10 feet high, and has stood out unprotected for several years without being injured. The Kew plant is certainly the same species as the one in the Chelsea Botanic Garden, which is there kept in a greenhouse during the winter; this circumstance causes the branches and shoots to be longer and slenderer than those of the one at Kew; but young plants struck from cuttings of each have no perceptible difference. It is surprising that this beautiful and hardy evergreen, so long introduced, has not become more common in collections, and particularly as the plant strikes freely from cuttings of the two or three years old wood, if taken off early in the autumn, and treated like cuttings of other Coniferæ.—*Bot. Reg.*

CLETHRA QUERCIFÓLIA. Oak-leaved Clethra. *(Greenhouse Shrub.)* Ericaceæ.—A handsome evergreen greenhouse shrub, with deliciously-fragrant flowers, inhabiting the neighbourhood of Jalapa, in Mexico. It is not hardier than C. arbórea, and requires the same treatment, growing freely if planted in any good garden soil which is rather light. It is easily increased either by layers or seeds.—*Bot. Reg.*

MISCELLANEOUS.

New Clover.—Two new Clovers have been attracting attention in France, concerning which we find some information by M. Vilmorin, in the "Bon Jardinier." One is the Hybrid, and the other the Elegant. Elegant Clover was for some time considered identical with one called T. hybridum, cultivated in Sweden; when, however, growing together, the differences are striking; the latter is larger in all its parts than the former, and the colour of its flowers is a brighter rose, shaded with white in the centre, while the Elegant Trefoil has rather dull reddish rose blossoms, coloured alike in every part of the flower-head. The appearance of the herbage is different; the Hybrid clover has bright and dark foliage, and that of the Elegant is pale and unequal; the leaflets of the latter are also marked with a brown band like common Clover, which is not the case with the Hybrid. Another character of the Hybrid is that in the summer, when it begins to shed its blossom, and during the autumn, the root throws out fresh foliage, arranged like a rosette; but in the Elegant Trefoil this does not occur; it is the lateral branches which rest on the ground that supply the verdure. The Hybrid Trefoil also flowers fifteen days earlier than the other, which however lasts the longest, and branches more; lastly, the former is taller, more beautiful, and comes in earlier; but when the latter has arrived at perfection, having more numerous stems well covered with branches, and more solid, it will, when mown, yield as great a produce as the former. The Hybrid Trefoil has been a great deal used by M. de Kruus in the formation of artificial fields at Orebro in Sweden, and it has succeeded well; it has grown from three to four feet high, and has yielded during about twenty years often more than 10,000 pounds per tunnland (about an acre and a quarter English), and always upwards of 5,000 for the first ten years. It is regarded as a plant equally suitable to cultivate for mowing and for pasturage; strong moist soils, argillaceous or calcareous, suit it well; it frequently comes up spontaneously on lands in Sweden that have been drained. The Elegant Trefoil is found in abundance on poor clayey strong soils, where it grows thick and vigorous; it is wild in France in many places, not unfrequently in ferruginous sand. It is more than probable that both the species will one day form valuable additions to our forage plants, as they appear as though they would succeed on land unsuitable for Clover, Lucern, and Sainfoin.—*Abstracted from the Bon Jardinier.*

Feeding Poultry.—Professor Gregory, of Aberdeen, in a letter to a friend observes, "As I suppose you keep poultry, I may tell you that it has been ascertained that if you mix with their food a sufficient quantity of egg-shells or chalk, which they eat greedily, they will lay, *cæteris paribus*, twice or thrice as many eggs as before. A well-fed fowl is disposed to lay a vast number of eggs, but cannot do so without the materials for the shells, however nourishing in other respects her food may be; indeed, a fowl fed on food and water, free from carbonate of lime, and not finding any in the soil, or in the shape of mortar, which they often eat off the walls, would lay no eggs at all with the best will in the world. Lay this to heart, and let me know in spring if the hens lay two, or two for one."

The Puvis Cardoon.—The Puvis Cardoon grows stronger than any other kind, and the great size which it often attains renders it remarkable; it is cultivated for the market at Bourg and Lyon, and is much sought after in consequence of its beauty. The leaves have very large divisions, and are more resembling a strong-grown Artichoke than a Cardoon; in some plants they are not prickly, in others slightly so. Some specimens have grown to an enormous size.—*Bon Jardinier.*

Botanical News.—We learn that M. Jaubert is occupied with the publication of his large collections of Oriental Plants, and that one number of his work has appeared. M. Boissier, so well known for his investigation of the Spanish Flora, is occupied with the same subject, publishing the result of his study in the Annales des Sciences. It is mentioned in letters from Vienna that Endlicher has decided upon undertaking a Species Plantarum, a most laborious task, for which few men are fitted, but for which this distinguished botanist has the highest qualifications. Professor Parlatore has just published a collection of new species of plants, among which are the following new genera: viz.—Maillea, founded on Phalaris cærulescens and others; Avellinia, founded on Bromus Michelii; Serrafalcus, to which Bromus racemosus is referred. Dr. Splitgerber has produced some critical observations on the Bignoniaceous plants of Surinam, in which he has proposed the genus Couralia, upon the Bignonia fluviatilis of Aublet. A number of new species of Balsam Poplars have been published by Dr. Fischer in the Gartenzeitung; among them P. tristis, longifolia, pseudo-balsamifera, and suaveolens, are new, but probably all exist in our gardens as varieties of P. candicans or balsamifera. Dr. De Vriese has commenced the printing of a Dutch translation of Lindley's Theory of Horticulture; and an American edition of the same work, prepared by Dr. A. Gray and Mr. Downing, has also appeared. Messrs. Achille Richard and Adrien de Jussieu have just left London, where they arrived a few days since for the purpose of examining some of the collections of Orchidaceous plants in which England is so rich. The former of these distinguished botanists is engaged in the publication of Linden and Galeotti's Mexican Orchidaceæ, and of the Cuba Flora of M. Ramon de la Sagra.

Dahlias.—The following list contains the names of 50 Dahlias most desirable for their beauty and variety of colours. We have not taken new sorts in preference to old, unless decidedly superior in the same line. A good shape and habit have been a particular object in the selection, and as great a variety in colour as possible. To make the list more perfect, the colours of each flower are added:—

Andrew Hofer, Holmes, dark crimson.
Amato, Dandy's, rosy purple.
Bishop of Winchester, light purple.
Annot Lisle, Begbie, crimson.
Burnham Hero, Church, puce.
Conservative, Low, light rosy purple.
Climax, Jeffries, purple.
Conductor, Widnall, light purple.
Egyptian Prince, dark plum colour.
Essex Rival, Sorrell, bronzy purple.
Euclid, Ward, very light purple.
Constancy, Keynes, purple.
Fanny Keynes, light rosy purple.
Metella, Begbie, purple.
Ne plus ultra, Widnall, maroon shaded with purple.
Pickwick, Cormack, fine purple.
President of the West, crimson.
Rouge et Noir, Ansell, maroon and light crimson.
Springfield Rival, Lynes, crimson.
Suffolk Hero, Girling, maroon.
Victory, Knight, deep crimson.
Bloomsbury, Lee, scarlet.
Eclipse, Widnall, red scarlet.
Scarlet Defiance, Coulson.
Regina, Gregory, red.
Tournament, Catleugh, scarlet.
Eclipse, Catleugh, vermilion rose.
Admirable, Spary, rosy purple.
Hope, Neville, rose.
Maria, Wheeler, rose.
King of the Roses, Thompson.
Queen, Widnall, peach blossom.
Lady Cooper, Jackson, delicate rosy lilac.
Lady Harland, Jeffries, bright lilac.
Lady Middleton, lilac.
Nicholas Nickleby, salmon shaded.
Argo, Widnall, yellow.
Defiance, Cox, yellow.
Bloomsbury, Pamplin, buff.
Duchess of Richmond, Fowler, salmon shaded.
Henrietta, Begbie, yellow.
Unique, Ansell, yellow edged.
Grace Darling, Dodds, salmon shaded.
Lewisham Rival, white.
Bridesmaid, Brown, white tipped with purple.
Beauty of the Plain, Spary, white edged with lavender.
Maid of Bath, Davis, white laced with purple.
Mary Dodds, white tipped with purple.
Phenomenon, Whales, white edged with rose.
Exquisite, Holmes, white and lavender.

GARDEN MEMORANDA.

Horticultural Society's Garden, Turnham-green.—At this season of the year, when winter can scarce be said to have left us, we can expect to find little deserving of notice in the open air; still there are a few plants in the arboretum here which ought not to be passed over. A fine plant of Magnólia conspícua, is blossoming freely on the south wall, where, with Mahónia aquifólium, Coriaria nepalensis, Lonicera Pallasiana, and Bérberis dulcis (which are also in flower), they have been protected by a thatch of straw. In an oval clump near the extremity of this wall the singular Dirca palustris is in blossom. In the small flower-garden adjoining the stoves, several Fuchsias, whose stems were covered closely with straw during the winter, do not appear to have been injured by the frost, and are shooting out from the very tips of last year's wood, being temporarily protected by boxes formed of the asphalte felt mentioned in page 100 of last year's *Chronicle.* The Orchidaceous house contains many plants which are highly beautiful. Amongst them is a variety of Oncidium ampliatum, much superior to the old one in size and abundance of flower; with Oncidium Baueri, luridum guttatum, two varieties of Oncidium sphacelatum, Dendróbium secundum, Maxillaria Harrisóniæ and aromatica (the strong and delicious perfume of the latter resembling cinnamon), Aspasia epidendroides, Brassia macrostáchya, Acanthophippium bicolor and sylhetense, and a pale variety of Cyrtopodium punctatum. In the greenhouse are some pretty Cinerarias (one of which, marked 5, is a good seedling), and a dwarf variety of Chorozema várium, which appears to excel in the profusion of blossoms which it produces. A small plant of Hóvea pungens is now expanding its purple blossoms, which though not so large as those of H. Celsi, equal them in colour; with Pimelea spectábilis, and a new Acácia called urophylla—but the latter is not to be compared with many of the old species. In front of this house is a range of pits, in which Camellias are flowering well, having been simply protected by mats thrown over the lights in frosty weather; amongst them are fine plants of C. reticulata and Colvilli. Large specimens of Euphórbia splendens and Colúmnea Schiediana are blooming well in the curvilinear stove, along the roof of which Passiflora alata has been trained, and is beginning to expand its lovely blossoms. Here we also noticed Ceropegia elegans and a new Begonia called crassicaulis. In another stove partially devoted to the growth of Orchidaceous plants, the large specimen of Lælia superbiens sent from Mexico by Mr. Hartweg, though grown [illegible], does not seem likely to flower yet. In blossom are Maxillaria cruenta (a fine new species), Epidendrum selligerum whose flowers are as fragrant as Violets, Odontoglossum stellatum, Oncidium leucochilum, forming festoons of white and yellow airy flowers; and Epidendrum aurantiacum, but the beauty of the latter is nearly gone. The large conservatory will in a short time be a great object of attraction. It is already gay with numerous Acacias the chief of which are Acacia [illegible], pubescens, vestita, [illegible] a splendid mass of bloom, tristis, verticillata, vernicifiua, and a variety called R[illegible]. Besides these, there are Clianthus puniceus, [illegible], Adenandra uniflora, Dillwynia cinerascens and floribunda, several varieties of Camellia, Polygala grandiflora, and Fuchsia splendens, which proves to be quite a distinct species with shorter and brighter flowers than F. cordifólia.

Amongst the succulents in flower are Echevéria gibbosa and a new species called rósea. Here is also a Tropæolum from South America, similar to brachyceras, but with the sepals tipped with green, and the petals neither so large nor so bright as in that variety. The broad walk, immediately fronting the principal entrance to the conservatory, has been new gravelled, which has greatly improved its appearance, and when completed will form a delightful promenade round the garden. To those who do not regard lengthening their ramble a trifling distance, the path leading to the Duke of Devonshire's will afford a pleasing gratification; the Ribes planted on each side of this are now expanding their graceful and pendent blossoms, and present a beautiful vista on which the eye delights to gaze. In the forcing department the Vines in the first house have a pretty regular crop, and are just coming into bloom. the second house is also showing remarkably well. The new Mexican Pinuses, in the pits of the hardy department, are making rapid growth; another year or two will enable those interested in them to judge of their distinctive characters. Many experiments are in course of trial with different chemical solutions; and an equal quantity of Daniells' manure and Guano has been distributed to the superintendent of each department, so that in a short time we may expect to become acquainted with the respective value of each.—*R. A., April 4th.*

Low's Nursery, Clapton.—Several strong plants exist here of a new Tropæolum lately flowered by Mr. Kelland, of Jersey. It is the T. polyphyllum of Hooker and Arnott, and certainly the finest species yet introduced. The habit and mode of growth are those of T. tricolorum, but much stronger. The flowers are a clear bright orange yellow, four times as large as those of T. brachyceras, and produced in the greatest profusion. The tubers were sent to Mr. Low from Valparaiso by Mr. Bridges. This species is a very great acquisition and will make a capital plant for exhibition.

Messrs. Whitley and Osborn's Nursery, Fulham.—The large collection of Narcissi here is at present in great beauty, and affords a treat to lovers of this tribe. Among many fine hardy evergreens which are kept in pots, we observed a large stock of Juníperus excelsa, a beautiful species, which should be more generally known. The show house is gay with fine species and varieties of Camellia, Erica, Rhododendron, and Azalea.

Reviews.

The Farmer's Encylcopædia, Part VIII.

We are glad to find that the improvement in this work, formerly noticed by us, continues, and that as the work proceeds, its interest increases. In the number before us there is an elaborate article on the plough, illustrated with 50 woodcuts, representing the varieties of this important implement, from the rude contrivances of Eastern nations to the most improved forms now in use. In an article on the Potato we find the following account of some experiments in manuring it, which will be useful to our readers at the present season.

"The soil on which my experiments were tried is a ferruginous sand, brought to a due texture and consistence by a liberal covering of pond mud. Of this soil, in its improved state; I mean by the accession of pond mud (for having been used merely as a nursery for raising forest-trees, previous to these experiments, the nurseryman had had not thought it necessary to make use of any other manure); the following is the analysis 400 grains gave:—

Of silicious sand, of different degrees of fineness	280 grains
Finely-divided matter	104 ,,
Loss in water	16 ,,
	400

"The finely divided matter contained—

Carbonate of Lime	18 gr.	Loss by incineration (probably vegetable decomposing matter)	17 gr.
Oxide of Iron	7 ,,		

"The remainder, principally silex and alumina. There were no indications of either gypsum or phosphate of lime.

"On the 14th of April, 1804, a portion of this soil was laid out in beds one yard wide and forty in length, and were manured as in the following table. On the same day the whole was planted with Potatoes, a single row in each bed; and that the general experiment might be conducted with all possible accuracy, each bed received the same number of sets. On the 21st of September the Potatoes were taken up, when the produce of each row was, in succession, as follows:—

Manures in bush. per acre.	Produce.
1. No Manure	157
2. Salt 8 bus., soot 30 bus.	240
3. Chandler's graves 9¾ ct.	220
4. Salt 8 bush., wood ashes 60 bush.	217
5. Salt 8 bus. gypsum peat 363 bush., lime 121 bush.	201
6. Salt 8 bush., lime 121 bush., dung 363 bush.	199
7. Salt 8 bush.	198
8. Salt 8 bus., graves 9¾ ct.	195
9. Soot 30 bush.	192
10. Fresh dung 363 bush.	192
11. Salt 8 bush., malt dust 60 bush.	189
12. Wood ashes 60 bush.	187
13. Salt 8 bush., decayed leaves 363 bush.	187
14. Salt 8 bush., peat ashes 363 bush.	185
15. Malt dust 60 bush.	184
16. Salt 8 bush., lime 121 bush., peat 363 bush.	183
17. Salt 8 bush., saw dust 363 bush.	180
18. Salt 8 bush., peat 363 bush., bone dust	178
19. Decayed leaves 363 bus.	175
20. Salt 8 bush. lime 121 bush., sulphuric acid	175
21. Salt 8 bus., peat 363 bus.	171
22. Salt 8 bus., lime 121 bus.	167
23. Peat 363 bush.	159
24. Saw dust 363 bush.	155
25. Lime 121 bush.	150

"The following experiments upon Potatoes are extracted from Mr. George Sinclair's Communication to the Board of Agriculture, February 25th, 1820. These experiments were made upon a soil composed of three-fourths silicious sand, in plots of thirty-six square feet.

	Bush. of Salt per Acre.	No.	
1. Planted without any kind of manure	0	124	
2. Twelve cubic in. of salt with the seed	13⅓	106	the smallest
3. Six cubic inches of salt with the seed	6⅔	90	
4. Twelve cubic inches of salt mixed with the soil	13⅓	93	the largest

"The weight of the crop of Potatoes was not taken. The superior size of the roots produced by No. 4 left no room to doubt of the advantage of thirteen bushels of salt per acre, applied to the soil previous to planting, over the other modes of application; still the superiority was not very great.' 'I may notice here,' observes Dr. Holland ('Agricultural Survey of Cheshire,' p. 143), 'a practice pursued at Weston, near Frodsham, in the culture of Potatoes, which seems deserving of attention. At this place, situated close to the junction of the Mersey and Weaver, sea mud is used as a manure for crops of Potatoes; twenty loads being the quantity usually laid on an acre. The ground thus manured not only gives a large produce of Potatoes, but is in a state of excellent preparation for a succeeding crop of either Wheat or Barley. The adoption of this practice has increased very greatly the value of land about Weston.'"

Proceedings of the Geological and Polytechnic Society of the West Riding of Yorkshire, 14th Meeting. August, 1841.

There is nothing more characteristic of the present day than the intellectual activity of great classes of people who were formerly remarkable for supineness and indifference. The agriculturists are becoming aroused to a sense of their deficiencies, and among the more obvious indications of this feeling is the formation of agricultural societies and clubs for promoting the science and practice of agriculture. In noticing the proceedings of the above society, we shall confine ourselves to the able report of the Rev. W. Thorp, on the agricultural geology of the part of the Wold district of Yorkshire, and of the Oolite in the neighbourhood of North and South Cave. The paper is divided into three parts. 1, On the geology of the district; 2, On the application of the principles of botany and chemistry to agriculture; 3, Suggestions for the improvement of the agriculture of the district.

Under the second head a chemical analysis of the soils lying on the various strata is given, in which some interesting facts are pointed out. It was found that the soils lying upon the chalk formation contained but little lime, and this Mr. Thorp accounts for by supposing that the lime has been washed out from the surface of the formation, leaving the siliceous portions to form the soil. The analysis of the Rummeridge clay affords a good instance of the impossibility of judging of the value of a soil from its chemical analysis, independent of its mechanical qualities. "This clay," says Mr. Spence, the analyst of these soils, "appears to contain everything, unless free carbonic acid and water, that we are taught to believe essential to vegetable life; yet its mechanical constitution, from being almost impermeable to air and water, renders it nearly as sterile as the worst of soils." The lias produces excellent feeding pastures; looking at the chemical constitution of the soils upon it, Mr. Thorp observes, "We think it probable that the capability of a soil to produce the superior grasses may be known by an inspection of its analysis; and that it will be found that any soil which contains from 5 to 9 per cent. of alumina will have this power. If there be less of alumina than 5 per cent., the soil will be too light and friable; if it contain more than about 9 per cent., it will be too tenacious for this purpose."

Liebig and some other writers following him, and who have apparently been attracted by the boldness and novelty of the statement, have asserted that plants derive their carbon from the carbonic acid of the atmosphere alone, and "that manure neither serves for the production of carbon nor has any influence upon it." And again, "that the quantity of carbon produced by manured land is not greater than that yielded by land not manured." Thinking that such a statement is likely to lead to practical errors, Dr. Thorp has devoted considerable space to considering this question, and we think he has proved from Liebig's own admission, and a number of facts, that the carbon in manures is taken up by the roots of plants, in the form of carbonic acid in water, or as humic acid in combination with ammonia. He very justly points out the unsoundness of the inference that because Orchises will grow in the air, Cacti in a carbonless soil, and Sphagnum and Hyacinths in water, all plants must necessarily derive their nutriment from the same sources as these. With regard to gypsum—sulphate of lime—Mr. Thorp thinks it valuable as a manure only to those plants which take it up into their structure, as Clover, Grasses, and Sainfoin, and that it neither acts by absorbing nor entering into chemical combinations with ammonia, as has been supposed by Liebig and others.

The third part of the report embraces many valuable suggestions for the improvement of the agriculture of the districts to which it refers. It contains much that is applicable to every part of the country, especially the remarks on collecting and preserving manures. We feel convinced that it is only by adopting the suggestions of enlightened research that British agriculture can be advanced. We sincerely hope that the paper of Mr. Thorp will be extensively circulated, and meet with the attention it so justly deserves.

CALENDAR OF OPERATIONS *for the ensuing week.*

Weeds now begin to grow apace, and if once permitted to get the upper hand, the utmost attention on the gardener's part in future will hardly prevent their maturing a crop of seeds sufficient to stock the garden for years to come. This important matter is liable to be neglected, less from want of thought than scarcity of time, at a season when a gardener has so many things of greater apparent consequence to do; it will therefore be excusable to suggest in this place the propriety of gentlemen allowing such extra assistance in their gardens for a few weeks at this season of the year, as may be requisite, by whicha great expenditure of time and labour will be prevented hereafter.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Great attention ought to be paid to the young plants now, when they are recovering from the check of repotting and beginning to grow again. Too much bottom heat must be cautiously avoided; but when there is no reason to apprehend this, the pots should be plunged to their rims in the bark or leaves, in which the newly-formed roots will be subjected to less variations of temperature and moisture than if they were more exposed to the atmosphere of the house. Frequent sprinklings or steamings will preclude the necessity for much water at the roots; still the plants ought to be looked over at least once a week, and such of them watered as require it.

Vinery.—As the early Grapes progress in colouring, air must be given more freely, and the bunches exposed as much as possible to the light by cutting close off such of the laterals as shade them, and which have hitherto only been stopped; the house should also be kept drier. The conditions necessary to the perfect maturation of Grapes are, free exposure to light and air, and comparative dryness—that is, less moisture than has been afforded them during the period of their growth. Pine plants, on the contrary, grow best in a close and humid atmosphere; therefore if these are cultivated in the same house, which is often done, considerable discretion will be needed so to balance the opposite treatment required, that what is advantageous to one plant may not be carried so far as to be injurious to the other.

Peach-house.—The chief attention now required in the early house is to tie in the shoots regularly, and to keep the foliage clean and healthy by frequently syringing and fumigating it. By this time it will be seen whether too much fruit has been left upon the trees at the final thinning; if so, some of the least promising and worst-placed should now be taken off. See likewise to the due watering of the borders, that the swelling of the fruit may not be checked.

Cherry-house.—Except in cold nights, very little fire will be required at this time by the successional houses; fruit that is perfectly stoned may, however, be forwarded, if necessary, by a night temperature of 60°. Take care to keep the leaves clean and free from insects.

Fig-house.—Syringing twice a-day should never be omitted if the slightest indication of red-spider is observed. As these insects harbour chiefly on the under side of the leaves, where they are difficult to get at with a common syringe, one of the inverted kind will be found more efficient.

Strawberries.—Be careful to water regularly, and with manure-water now and then. Plants from which the crop has been gathered may now be planted out in rows, and they will bear plentifully next year.

Cucumbers and Melons.—Take advantage of every fine day to look over and regulate the plants, which ought never to be allowed to ramble wildly over the beds. A regular system of training should be followed from the first, which will greatly simplify their after management. Sprinkle the leaves on fine afternoons, and shut the frames up warm; but be careful to dry the leaves in the morning before the sun gets strong, by giving air in time. Young plants intended for bedding out should never be starved for want of pot-room; give them an extra shift when the beds are not ready to receive them.

Kidney Beans.—Sow another crop. If more convenient, they may be raised in boxes or pans, and afterwards transplanted into the fruiting-pots.

Pot off Capsicums, Tomatoes, and other tender esculents. All vegetables under glass should be exposed whenever the weather permits, and young Cauliflowers and Lettuces may be pricked out in a sheltered spot. Also finish the transplanting of spring-sown Onions which have been raised in heat. At page 176, "those sown in heat" should have been "those sown in autumn."

Out-door Department.

Slugs are unusually numerous and destructive this spring. Fresh brewers' grains are an excellent bait for them, which should be put down in handfuls here and there about the borders. On mild nights these heaps will be almost covered with slugs, which may readily be destroyed by a dusting of powdered quicklime, or salt.

Asparagus.—Rake the beds that have been forked, and line off the edges neatly.

Broccoli.—Sow more seed of the early varieties, such as Grange's White and the Cape. The late spring sorts should not be sown yet.

Cabbages.—Put out the remainder of the autumn plants.

Cardoons.—Sow for a first crop; when sown earlier they are very apt to run.

Carrots.—Hoe between the rows of those sown in autumn; the loosening of the surface will not only keep down weeds, but also be of great benefit to the plants.

Garlic, Shallots, and Onions, planted and sown in autumn, will likewise be benefited by the same operation.

Lettuces.—Tie up leaves of the most forward Cos, to blanch them. Sow a little more seed, in case that sown in the beginning of last month should fail.

Mustard and Cress.—Sow every week.

Peas.—Earth up and stick as they require it.

Potatoes.—Finish the planting of the principal crop as soon as practicable. If the ground is stiff and cloggy, a dressing of quicklime, lightly pointed in at the time of planting, will be of great service.

Radishes.—Keep up a succession of young ones, by sowing a small quantity of seed about once a fortnight or ten days.

Orchard.—Finish the weeding of Strawberry-beds as soon as possible. As the spring is likely to be cold and unsettled, particular attention will be requisite in protecting the blossoms of wall-trees. When perfectly dry, these will bear a greater degree of cold than is generally imagined; therefore the best protectors are those which shelter the trees from wet at the same time that they break the force of a cutting wind. A little warmth in the flued walls would be beneficial on cold nights.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Shade Orchidaceous plants during bright sunshine, and keep the atmosphere of the house very moist. Remove the shade as early as possible in the afternoon, syringe the plants and leave the house for the night hot and damp. Stanhópeas which have not been growing lately may be expected to flower; do not pot them or disturb them in any way, in case the flower-stems are injured by it. This applies to all plants of this kind which send their flower-stems downwards.

Greenhouse and Conservatory.—Many of the plants will now be growing freely; let them, therefore, have sufficient air to prevent their being drawn up weakly. If handsome specimens are desired, the plants must have room to grow without touching each other, they should also be occasionally turned round, that all sides may be exposed to light, or they will become one-sided. Camellias that are making growth should be kept in a shady part of the house; the young leaves are often injured by the sun. If not yet done, Geraniums and Calceolarias should be shifted into their blooming-pots.

Pits and Frames.—Continue the propagation of Dahlias by cuttings, and likewise of Heliotropes, Verbenas, Cape Asters, &c.; if assisted by a gentle heat, cuttings of these will very soon make plants. Let Auriculas have plenty of air as the flower-stems advance and the blossoms expand; but they must not be exposed to frost or wet. Partial air in bright weather will be necessary when the plants are in bloom.

Out-door Department.

Before mowing is commenced, the lawns should be thoroughly cleared of such unsightly weeds as Dandelions, Thistles, and Plantains. It is impracticable to dig out the roots of the first, but the plants may be destroyed by cutting them off just beneath the leaves and then dropping a pinch of salt into the hole. Where the grass requires encouragement, a thin sprinkling of nitrate of soda, pounded into powder, will be found very beneficial. In the flower-garden, Brompton Stocks which have been wintered in pots should be planted out. Ten-week Stocks, and other annuals, may be sown in drills between the rows of Tulips, &c.

NURSERY AND FOREST DEPARTMENT.

Nursery.—The transplanting of seedling evergreens should now be finished, making the soil firm about their roots. Evergreens may yet be layered, and also some of the latest deciduous trees and shrubs. Grafting ought for the most part to be completed now.

Forest and Coppice Woods.—In some parts of the country, where bark is valuable, it is customary to peel the thinnings of young Larch plantations, the expense of the extra labour being paid by the bark, and the poles being thereby raised in value. This should now be done where the trees are forward enough to part with the bark freely.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending April 7, 1842, as observed at the Horticultural Garden, Chiswick.

April		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	1	29.457	29.303	51	32	41.5	W.	.02
Saturday	2	29.780	29.576	47	31	39.0	N.	.02
Sunday	3	30.012	29.819	47	35	41.0	N.E.	
Monday	4	30.309	30.182	47	27	37.0	N.E.	
Tuesday	5	30.355	30.286	50	23	36.5	N.E.	
Wednesday	6	30.188	29.957	54	37	45.5	N.E.	
Thursday	7	29.907	29.800	58	35	46.5	N.E.	
Average		30.001	29.846	50.6	31.4	41.0		.04

April 1. Heavy clouds; rain; slightly overcast.
2. Cloudy; rain; clear and cold, with brisk north wind.
3. Very clear; cloudy; slight hail shower; clear.
4. Cold and dry; cloudy, clear and frosty at night.
5. Clear and cold; air very dry; clear, with sharp frost at night.
6. Clear; sunshine and slight haze; overcast at night.
7. Overcast; cold and dry; densely overcast at night.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending April 16, 1842.

April		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 16th, 1840—thermometer 70°; and the lowest on the 10th, 1837—thermometer 23°.

REPORT ON COVENT GARDEN MARKET,

For the week ending April 8, 1842.

The prevailing cold winds have rather shortened the supply of some kinds of vegetables. Fruit, however, is plentiful, and trade has been rather brisker this week than last.—*Fruit*. Pines are plentiful at the prices last quoted. A few hothouse Grapes are offered. Apples do not differ in price from our last Report; we observed several good samples of the London Pippin, called Royal Somerset. Good Pears of the usual kinds are tolerably plentiful. The supply of Strawberries is increasing; some of those offered are excellent. Cucumbers are not scarce; but the price has not changed since our last.—*Vegetables*. The cold weather has rather diminished the supply of Broccoli. A large quantity of fine red Cabbage has been offered. Good Kidney Beans are plentiful. New Potatoes are rather more plentiful than they were; they are fetching from 2*s*. to 2*s*. 6*d*. per lb. Asparagus is excellent, but the supply has been rather short this week, consequently high prices have been obtained. Seakale abounds, and the price is very low. Spring Radishes are abundant. Salading of all kinds is plentiful, and has improved in quality. Handsome Rhubarb is abundant.—*Flowers*. The market has been very gay this week; among Cut Flowers we observed several Amaryllises, and many Camellias.

PRICES Saturday, April 9, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 6*s*
— Dessert, per bushel, 4*s* to 12*s*
Pears, dessert, per half-sieve 4*s* to 11*s*
Strawberries, forced, per oz., 1*s* to 1*s* 6*d*
Pine Apple, per lb. 8*s* to 12*s*
Cucumbers, per brace, 1*s* to 6*s*
Grapes, hothouse, per pound, 25*s*
— Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 4*s* to 16*s*
— Bitter, per 100, 6*s* to 20*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Savoys, per dozen, 1*s* 6*d*
Cabbage, Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 3*s* to 5*s*
Broccoli, White, per bunch, 9*d* to 2*s* 6*d*
— Cape, 1*s* to 1*s* 6*d*
— Brown, 1*s* to 1*s* 6*d*
— Sprouts, per sieve, 1*s* 6*d*
Turnip Tops, per bushel, 9*d* to 1*s*
Kidney Beans, forced, p. 100, 1*s* to 2*s*
Potatoes, per ton, 45*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 2*s* to 2*s* 6*d*
Turnips, per dozen bunches, 1*s* 6*d* to 2*s*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 4*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s* 6*d*
— Turnip, per doz. bch., 2*s* 6*d* to 3*s*
Spinach, per sieve, 2*s* to 2*s* 6*d*
Chives, per pot, 6*d*
Leeks, per dozen bunches, 6*d* to 1*s*
Garlic, per lb. 8*d*
Shallots, per lb., 1*s*
Onions, per half sieve, 1*s* 6*d* to 2*s* 6*d*
— for pick., per hf. sieve, 2*s* to 2*s* 6*d*
— Green, per doz. bunches, 2*s* to 4*s*
— Spanish, per dozen, 1*s* 6*d* to 6*s*
Asparagus, per 100, large, 7*s* to 16*s*
— Second or Middling, 3*s* to 4*s*
— Sprue, or Small, 1*s* 6*d* to 2*s* 6*d*
Sea-kale, per punnet, 6*d* to 1*s* 6*d*
Lettuce, Cabbage, per half sieve, 1*s* to 2*s* 6*d*
Cos, per half sieve, 1*s* to 2*s*
Endive, per score, 1*s* 6*d* to 3*s*
Celery, per bundle (12 to 15) 6*d* to 2*s* 6*d*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 8*d* to 1*s*
Watercress, p. dz. small bunch. 7*d* to 8*d*
Parsley, per half sieve, 1*s* to 2*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per dozen bunches, 3*s* to 9*s*
Basil, per bunch, 9*d* to 1*s*
Rhubarb Stalks, doz. bundles, 4*s* to 18*s*
Mushrooms, per pottle, 10*d* to 1*s* 6*d*

Notices to Correspondents.

To Correspondents.—As the season is approaching when we may expect to be revisited by that destructive insect the Onion-fly, any information from such of our readers as may have been successful in checking its ravages will much oblige us.

R. W. B.—We cannot help you about the Manures. They can only be had wholesale; we do not think Poittevin's of much value. Guano is to be had of the drysalters. Keep the drainings from your stable in a tank or butt, then add finely-powdered gypsum till the smell disappears; stir the mixture often; in 12 or 24 hours the volatile parts will be secured. One part of this fluid added to 4 parts of rain water will make excellent liquid manure. If old decayed manure is soaked with ammoniacal liquor, it would be better to add finely-powdered gypsum, when it is turned over till the smell ceases, and in a month it will be fit for use. There is no cure, that we know of, for your Ranunculuses; if their foliage is injured this year they will not flower next, because the business of the leaves of to-day is to prepare the bloom of to-morrow.

Messrs. Lucombe and Co.—Your Camellia rhodopetalon came in very bad order. It is a fine sort, but apparently near C. elegans.

Reader.—Gooseberry and Currant plants can now only be conveyed to distant colonies in Ward's cases, or some similar contrivance. It is, however, much more convenient to take the seeds of such plants. If despatched in November, packed in moist moss, in close boxes, plants are said to have occasionally succeeded, but we doubt the fact.

L. G.—Although Ivy planted against a newly-whitewashed wall refuses to adhere to it in the usual manner—probably on account of the fresh lime in the whitewash—yet if artificially supported it may be expected to succeed after a time. This plant partially derives nourishment through those fibrous means by which it adheres to the object against which it grows: but if deprived of them, the roots alone will convey sufficient nourishment to give it vigour. We know nothing of Dahlias being injurious to Bees or their honey; but the bloom of Rhododendrons, although not injurious to Bees, renders their honey deleterious in countries where such plants abound. Doubtless nature in most cases provides its unreasoning creatures with an instinct that protects them from such risks, and it is only reasoning man who is unable to avoid them. The brown Insect, larger than a large bug, which does much injury to plants growing on the walls of your cottage,—attacking the youngest and most tender leaves, buds, and shoots, and sometimes the bark also, committing his depredations at night, when, with the aid of a lantern, he may be discovered, and as soon as discovered is active in endeavouring to escape, but by day is never seen,—is probably a Curculio, formerly called Vastator, but now named something else. He can only be caught by drawing the shoots on which he feeds through the hand at night, when he will remain in the palm, and may be thrown into a bottle of water.

If *One of our Readers* will reconsider the matter, he will find that his objections are unfounded. All Manure is offensive, and not to be scrutinised closely. If his opinions are adopted, good bye to fine vegetables. Farmers, instead of wasting that particular kind to which our correspondent alludes, should have the skill and good sense to deprive it of its offensive character, and to use it as copiously as possible.

J. T. C.—Steep your Seeds of Hovea Celsi in boiling water for three minutes; they will then germinate quickly. Your Acacia is A. rúbida.

A Double Subscriber.—Salt should be applied to walks in damp weather. It will be better to cut your Holly-hedge about 1 foot from the ground. The time which Azálea and Rhododendron seeds require before they germinate varies from one month to three, according to temperature. Your old and naked Heaths may be cut down now; place them in a close frame or pit without bottom heat; and when they commence growing, inure them gradually to more air, and treat them as before.

B. B.—It is impossible to name your plant, unless we have a better specimen.

A Subscriber.—We are unacquainted with any Moss Rose which has the appearance of a dew drop on the moss around it. Zínnia elegans and its varieties are best adapted for the open borders. They require to be raised in heat.

E. R.—In this week's *Chronicle* there is a list of Dahlias; one of Geraniums will appear next week.

S. J.—You can do nothing *now* to your Peach-trees which are infested with the brown scale; you had better try glue-water next winter. The spots upon the leaves of your Geraniums appear to have been caused by syringing them when the sun has been shining bright upon them.

A Regular Subscriber.—Your Kennédyas will perhaps flower if grown at a window where there is plenty of light and air. They appear to be properly named. The best remedy we can recommend to free them from the scale, is to pick them carefully over, and wash them with strong soap-suds.

T. Ann.—Your plant *is* the true Primula elatior.

If *J. H.* will look into the writings of Liebig, Boussingault, Payen, Daubeny, the "Philosophical Transactions," or the third edition of "Lindley's Introduction to Botany," he will find abundant proof of nitrogen being an essential principle in the food of plants. As he professes his entire ignorance of that fact, we cannot admit his speculations upon the subject. If Mr. H. has any *proof* (we do not mean opinion) to the contrary, that, indeed, we should be happy to insert. He says he is "no chemist," nor "professed physiologist:" how, then, can he deal with chemical or physiological questions? As to the conclusions of Mrs. Ibbetson, to which he refers, is it possible that he is unaware that her microscopical observations were the visions of a dreamer, which no man of science has ever thought it worth his while to expose?

J. T. A.—A fine species of Habranthus will be figured soon in the "Botanical Register."

Inquirens.—If snuff is dusted over those shoots of your plants which are infested with the green-fly in an early state, it will check them; when very numerous, there is no other remedy than fumigating them with tobacco.

Peirpont's flowers are,—1, Draba aizoides; 2, Sanguinaria canadensis.

Asor.—We cannot undertake to name Cryptogamic plants, having no connexion with cultivation.

Mouse.—We, too, have a favourite Cat, who, whenever she can, gets into the garden and amuses herself with digging up the seeds which we have just been setting. We have succeeded in keeping her off the flower-beds, without poisoning her or preventing the young plants from coming up, by stretching a cover of netting all over them.

G. B.—The analogies shall find a place so far as they are free from errors of fact; but some are founded upon mistakes, and these we must take the liberty of omitting.

W. Mulville's plant is Dracæna australis.

A. N.—The seeds which you have received from Ceylon and Bengal had better be sown in pots, and plunged in moderate heat. None of them will bear the low temperature of this country: they will therefore require, as they advance, to be transferred to a stove.

C. A.—Your Apricot and Gage trees should have been pruned before; however, they will sustain no material injury from being pruned now.

R. J.—Any light sort of bunting will answer your purpose for shading Geraniums. You must inquire for it in the shops, or consult the columns of advertisements.

S. T.—The disease in your Vine-leaves is evidently occasioned, not by an insect, but by the Vines drawing more nourishment from the soil than the leaves can possibly elaborate, owing to the coolness of your house; they in such a case become distended with food, and break out, like cutaneous eruptions in the human system; you must, therefore, raise the temperature of your vinery. The spots on your Melon-leaves are caused by a small insect, which eats its way between the upper and under surface of the leaf; the only way to destroy it is to pick off *all* the infested leaves and *burn them*.

S. S.—Gardenia radicans will thrive in peat, mixed with a small portion of silver sand; it requires a moist atmosphere and plenty of water. Cuttings of the Oleander will strike readily in water, if the phial is plunged in a warm bark-bed or Cucumber-frame. Your method of mixing liquid manure is right, but on no account water your Heaths with it; pure rain-water is at all times preferable for that tribe of plants. You had better delay rubbing the buds off your Vines until you see which shoots are likely to produce Grapes. We will tell you how to manage "Canariensis" seeds when you tell us what "Canariensis" is.

A Constant Reader.—Vitis odoratíssima will succeed very well against a south wall. Stephanotis floribunda requires a mixture of loam and peat, with the same treatment as other stove plants. Its flowers are white; and it is not to be found in Paxton's Botanical Dictionary.

J. L. R. B.—Your Rosa mínima requires more heat to make it unfold its blossoms. Cucumbers will swell without being fertilised. To strengthen your seedling Gladioluses, they must be separated and planted out in the open ground; then taken up in the autumn and kept in a dry and airy situation until wanted for repotting. The curling of your Calceolarias is caused by the green-fly on the under side of their leaves. Spiræa venusta is quite hardy; and to the last of your questions we say, wood-ashes are a good remedy for destroying slugs; if these do not answer, use quicklime applied late at night and just before daylight.

Quidnunc.—Cereus Napoleonis and Martianus should be placed in a dry stove rather than in a Pine-pit. Cuttings of them should be laid in a dry place until the wound is healed over; they will then strike readily in sand. These kinds will not be at all benefited by being grafted on Cereus speciosíssimus. Pæonia festiva will flower well if it has plenty of pot-room.

A Countryman.—The meaning of the word "Victrix" is "Conqueror." Ribes (not Rhibes) is pronounced as two syllables.

D. M. P. D.—A single dish of Strawberries can be exhibited at the Horticultural Society's Garden amongst the miscellaneous collections of fruit.

An Admirer.—The best varieties of Pæony that can be obtained at a moderate price are Pæonia albiflora, Whitleji, Humei, paradoxa fimbriata, officinalis rubra, álbicans, carnescens, to which you may add P. Moutan papaverácea, and Banksii. Being plants which do not like to be disturbed, it is doubtful whether they will succeed in boxes. The Catalonian Jasmine is a greenhouse plant.

W.—The Pear-twigs afford satisfactory evidence of your having the true "Knight's Monarch."

M. F.'s plant is English Scurvy Grass—Cochlearia anglica.

Small Gardener.—We really cannot give you a list of the hardy perennials or biennials of which the roots are sold rather than the seeds; the nurserymen's catalogues are the proper documents to consult. It would take a page of our *Chronicle* to answer such a question.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The arrival of the overland mail, which reached town on Monday, has unhappily confirmed the disastrous intelligence brought by the mail of February respecting the army in Affghanistan. The whole body of troops in garrison at Cabul, amounting with camp followers to more than 13,000 men, has been treacherously destroyed; and so far as our information comes down, only one British officer has succeeded in making good his retreat, while scarcely more than 30 survive as prisoners and hostages. The details of these melancholy reverses,—the most serious which a British army has experienced since the foundation of our Indian empire,—are given at some length under our Foreign News. It appears from these accounts that after the murder of Sir W. M'Naghten, the commanding officer, Gen. Elphinstone, and Major Pottinger, the political agent, concluded a treaty with the Affghans, by which they agreed to evacuate Cabul, abandon the munitions of war, grant orders for the evacuation of the different strongholds, and fall back upon Jellalabad. For the faithful fulfilment of these humiliating terms, six British officers were delivered up as hostages. The army had scarcely left their cantonments, when Akhbar Khan, who had been the chief counsellor of Gen. Elphinstone, issued a proclamation, calling upon the natives to rise and annihilate the Kaffirs whom they had induced to quit their tents. The troops began to march on the 5th January. For the first two days they advanced without any regular attack on the part of the Affghans, but were severely harassed by their plunder, and by the difficulty of marching over a country entirely covered with snow. On the 7th the attack commenced on the rear-guard, and continued with little intermission for five days. It soon became evident that the ladies and children, who had hitherto borne the privations of the march with extraordinary fortitude, could no longer accompany the troops with safety. They were accordingly placed under the protection of Akhbar Khan, who engaged to conduct them to Cabul; and it is almost the only consolation afforded by these accounts that they appear to have been treated with respect. The army resumed its march; but a scene of indiscriminate slaughter ensued. Gen. Elphinstone fell into the hands of the enemy. Her Majesty's 44th Regiment was cut up; the Native troops were destroyed; and only one European—Dr. Brydon, and three or four natives, succeeded in reaching Jellalabad. Soon after their arrival, Gen. Sale received orders from Major Pottinger to evacuate that fortress, by virtue of the Cabul convention; but he refused compliance: and it appears fortunate that he did so, as Akhbar Khan, in anticipation of his quitting that position, had taken measures to destroy his troops during their retreat. It is believed that Gen. Sale will be able to maintain his ground, and in the mean time active measures have been taken by the Supreme Government to meet the emergency; a large force is concentrating at Peshawur, and a proclamation has been issued, announcing that the utmost energy will be used to repair these disasters, and that powerful reinforcements will immediately be sent to the Affghan frontier. The Governor-General concludes by declaring that he regards this reverse only as a new occasion for displaying the stability and vigour of the British power, and the admirable spirit and vigour of the British-Indian Army. From other parts of India we learn that serious disturbances have occurred among the Madras regiments in the territory of the Nizam, in consequence of the allowance of *batta* having been discontinued by order of the Court of Directors. The soldiers of the best regiments refused to obey their officers on account of this decision; but the mutiny was put down before it had assumed a more serious extent. The expedition of Tharawaddie to Rangoon has failed; his army has lost 3,000 men by their works at that place, and he has been obliged to retire with the remaining portion.—The news from China is not satisfactory; the expedition is still waiting the arrival of reinforcements, and all operations of an active nature are entirely suspended. The Chinese have collected large bodies of troops at Ningpo, and Sir Hugh Gough is of opinion that the force at his disposal is insufficient to hold the city in the event of an attack. The Chinese at Canton are also actively restoring the defences of that river with the assistance of Dutch engineers, and there appears to be little doubt that a renewal of hostilities will be attended with much more severe fighting than has yet occurred.

At home, the re-assembling of Parliament after the Easter recess is the only subject which requires notice.

The discussion on the Income Tax commenced last evening, and promises to occupy the House for several nights. The Corn-law Amendment Bill has passed the Commons without change, after numerous divisions, in which the Ministerial measure was affirmed by large majorities. On Wednesday Lord Mahon introduced his bill for the amendment of the law of copyright: the clause fixing the author's interest at 25 years was negatived; and after several amendments and divisions, it was resolved that the copyright extend to the whole term of the author's life, or to 42 years, if he dies before that period has elapsed from the publication of his work, with an addition of seven years after the author's death, for the benefit of his family.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, are all well. The Queen and Court left Windsor Castle on Monday for Buckingham Palace, where her Majesty still continues. The Queen and Prince Albert honoured Drury Lane Theatre on Monday and Covent Garden Theatre on Tuesday evening. On Wednesday her Majesty held a Court and an Investiture of the Order of the Bath, at Buckingham Palace, and on the afternoon of the same day visited the Queen Dowager at Marlborough House. On Thursday her Majesty held her first Drawing-room for the season at St. James's Palace, which was numerously atended. On Monday, Prince Albert performed the ceremony of laying the first stone of the new church at Windsor; and on Tuesday the Prince was present at a meeting of the commissioners for promoting and encouraging the fine arts at the rebuilding of the Houses of Parliament. His Royal Highness has signified his intention to be present at the Great Choral Meeting of Mr. Hullah's pupils, which is to be held on the 13th inst., at Exeter Hall.

Order of the Garter.—The blue riband, which became vacant on the death of the Duke of Norfolk, has been conferred upon the Duke of Cleveland.

Order of the Bath.—At the Court held by her Majesty on Wednesday, at Buckingham Palace, Lieut.-Gen. Sir Howard Douglas, Bart., Admiral the Hon. Sir John Talbot, and Admiral Sir Henry Digby, were severally invested by her Majesty with the riband, badge, and star of a Military Knight Grand Cross of the order of the Bath. On the same occasion Lieut.-Gen. Sir John Wilson, Major-Gen. Sir J. G. Woodford, Vice-Admiral Sir J. C. White, Rear-Admiral Sir Charles Richardson, and Rear-Admiral Sir Arthur Farquhar, were severally invested by the Queen with the star, riband, and badge of a Knight Commander of the same order.

Official Appointments.—The Queen has appointed Col. Sir H. G. Macleod, Knt., at present Lieut.-Gov. of the island of Trinidad, to be Governor and Commander-in-Chief of that island. Her Majesty has also appointed Major-Gen. W. F. P. Napier to be Lieut.-Governor of the island of Guernsey, in the room of Lieut.-Gen. Sir J. Douglas.

Parliamentary Movements.—The Committee appointed to inquire into the Weymouth election petition has decided that Viscount Villiers and G. W. Hope, Esq., were not duly elected, and ought not to have been returned as Members in the present Parliament for that borough, and that R. Bernal, Esq., and W. D. Christie, Esq. were duly elected and ought to have been returned. It it stated that the petition presented to the House of Commons against the return of Capt. Dalrymple for Wigtonshire has been abandoned. It has also been announced that the petitions presented against the sitting members for Shrewsbury and Gloucester will not be prosecuted. It is stated that two candidates have presented themselves for the representation of the Montrose Burghs, the Hon. E. J. Stanley, secretary to the Treasury under the late Administration, and Sir J. Carnegie, of Southesk.

The Revenue.—From the official report just published, containing an abstract of the net produce of the Revenue of Great Britain, in the years ended 5th April, 1841, and 5th April, 1842, it appears that the total income for 1841 was 44,675,886*l.*, and for the present year 45,363,827*l.*; showing an increase of 687,941*l.* The decrease on the Excise for the year is 65,427*l.*; on the Stamps, 123,589*l.*; amounting to 189,016*l.* decrease of the ordinary revenue: to which must be added the decrease on imprest and other moneys, 97,885*l.*; repayments of advances, 14,994*l.*; making a total decrease of 301,895*l.* The increase for the year on the Customs is 175,905*l.*; on Taxes, 422,188*l.*; on the Post-office, 90,000*l.*; on Crown Lands, 20,000*l.*; Miscellaneous, 281,743*l.*; making an increase on these branches of the ordinary revenue of 989,836*l.* By deducting from this sum the total amount of decrease, the accounts show an increase on the *year* of 687,941*l.*, as above. The accounts for the quarter just ended show a decrease on Customs to the amount of 23,455*l.*; on Excise, 116,309*l.*; on Stamps, 77,917*l.*; on Taxes, 71,392*l.*; amounting to 288,973*l.* on the ordinary revenue: to which must be added the decrease on imprest and other moneys, 6,437*l.*; making a total of 295,410*l.* On the other hand, the Post-office shows an increase for the quarter of 49,000*l.*; Crown Lands, 18,000*l.*; Miscellaneous, 274,067*l.*; amounting to 341,067*l.* on the ordinary revenue: to which must be added Repayments of Advances, 65,675*l.*; making a total of 406,742*l.*: by deducting from which sum the total decrease, as above, of 295,410*l.*, we find an increase on the *quarter* of 111,332*l.* The unusually large amount of receipts under the item of Miscellaneous includes the sum received for the ransom of Canton.

Foreign.

France.—The journals this week contain little intelligence, and are principally occupied with comments on the affairs of this country. The Liberal portion of the press more particularly indulge in speculations on what they consider the present critical state of Great Britain; the disastrous intelligence brought by the overland mail supplies the papers with an ample theme for discussion, and they all prophesy the speedy downfall of our Indian possessions.—On Monday a discussion took place on the supplementary credits for Algeria. The speech of M. Thiers presents the only feature of interest. He strongly insisted on the immediate outlay of large sums, in order to establish a great naval port at Algiers, capable of containing and protecting a fleet of 25 sail-of-the-line. M. Thiers declared that the establishment of this port with a fleet in it would close the entrance of the Mediterranean against England, the power which wished to predominate in it. He accused M. Guizot of being hostile to the completion of this port, because he did not wish to give mortal displeasure to England. He concluded by insisting vehemently for the completion of the port of Algiers, and for the completion of the twenty-five sail-of-the-line to fill it, and for the necessary consequence of this final outlay, viz. the exclusion of the British from the Mediterranean.

The Capital.—Private letters from Paris, dated Monday, announce that the King was confined to his bed from influenza, and was unable to receive company on Sunday night. Their Majesties the King and Queen of the Belgians have arrived in Paris, and received on Thursday the 31st inst., at the Tuileries, the visits of the members of the Cabinet, of Lord Cowley, and other members of the diplomatic corps.

The Chambers.—The Chamber of Peers on Saturday voted by 124 against 17 the Bill passed by the Deputies for a grant of a million of francs, supplementary secret service money. The debate was commenced by M. Dubouchage, who complained of the immorality of the French theatre. M. de Boissy followed, and censured the King and Government for certain nominations of Peers, and hoped that the new nominations threatened would not diminish the weight and respectability of the upper Chamber. The President interrupted this attack on the prerogatives of the Crown. Count Montalembert spoke next, and accused the Ministry of adjourning all internal questions, and of not having any ally abroad. French Envoys, he said, were not respected abroad. This M. Guizot rose and denied. Count Montalembert then proceeded to complain that the moral territory of France was invaded, and that he was sick of being congratulated on the duration of peace, which no triumph had preceded. Peace might suit a little country like Wurtemberg, but there was no dignity in preaching it to France. He then censured M. Guizot for having sent the Carlist and Christino refugees from the Spanish frontier into the interior. M. Villemain, Minister of Public Instruction, replied, and pointed out the absurdity of censuring in generalities so great and manifest a blessing as peace. If France, he said, was to develope her resources, communications, and material interests, it could not be done by preaching the magnanimity of war and the pusillanimity of peace. The Marquis of Dreux Brezé said, that, for the first time, constitutional government had reached that state in France when Parliamentary opposition was neutralised, and Ministers left without any check except that which they pleased to apply to themselves. The censorship was virtually re-established for the press, the liberty of education was abolished, and whilst every freedom was suspended, every plan of material amelioration was adjourned. All countries either mistrusted France or defied her. M. Martignac, he added, had said, in 1829, that France was going headlong to anarchy; but now, he considered, she was marching fast to despotism, and through despotism to anarchy. The Minister of the Interior, M. Duchatel, replied, and argued that the existing calm was a sign of events far different than either anarchy or despotism, and that there was no fear of reaction. He defended the Government for sending the Spanish emigrants into the interior, and concluded by promising a new law regulating the theatrical censorship. The grant was then passed.—The debate on the supplementary credits, including those for the *recensement*, and for Algeria, commenced on Wednesday in the Chamber of Deputies. It presents no feature of particular interest, and the different articles were ultimately voted.

The Press.—The "National" has again been sentenced to 4,000f. fine, and the costs of the prosecution, besides a year's imprisonment for the responsible publisher, for another seditious libel.

Spain.—Our intelligence from Madrid is not of great importance. The Chamber of Deputies resumed its sittings on the 28th ult., but the debates have been devoid of interest. The political circles of the capital continued to be much occupied with the declaration of Sir R. Peel, that a commercial treaty was negotiating between Great Britain and Spain; and it is stated that the Catalonian deputies have come to the resolution to desert their seats in the Cortes should the least commercial concession be made to England. They insist, it appears, in the name of their constituents, on the protecting duty not being reduced below 40 per cent. The Senators and deputies who had repaired to Toledo to assist at the religious festivities of the Holy Week, returned to Madrid on the 28th ult. The journals state that on his return from Toledo, Mr. Aston, the British Ambassador, had a long conference with the President of the Council, which had given rise to many conjectures. It is reported that the Minister of Finance will transmit to London in the month of May 60,000*l.* for the payment of the British Legion claims. A Ministerial journal announces the recall of Mr. Turnbull, British Consul at the Havannah. "The Spanish Government," it says, "had repeatedly demanded his removal; and the acquiescence of the English Cabinet shows its good faith."—We are informed by a Ministerial Paper, the "Morning Post," that the marriage of Queen Isabella, a question which threatened to produce serious dissension between the French and English Cabinets, is on the point of being definitively settled. The two Governments have arrived at the conclusion that in order to avoid any collision between the Great European Powers, a consort should be selected for her Majesty from the Princes who are totally unconnected with either of these countries, in order that neither England nor France should be enabled to exercise any undue preponderance in the political affairs of Spain. For these reasons England has abandoned her project of marrying the Queen to a prince of the House of Coburg, France has withdrawn her claims for a Prince of the Orleans family, Austria has renounced her hopes of an alliance between the youthful Queen and an Austrian Archduke, and the combined choice of England and France has at length definitively fallen upon a Prince of Bavaria. M. Pageot, who has recently returned from London, has consequently been sent on an extraordinary mission to Vienna, in order to obtain the sanction of Austria to this marriage, and also her mediation with the Courts of Berlin and St. Petersburgh for their consent and approbation. It is not anticipated that the great Northern Powers will interpose any serious obstacles to prevent this alliance, as perhaps it might re-establish order and tranquillity in that convulsed and distracted country.

Portugal.—We have received intelligence from Lisbon to the 28th ult. It is reported that the Duke of Palmella will be specially appointed by the Government to conclude the negotiations respecting the pending commercial treaty with England. The decree reorganising the national guards does not appear to be generally approved of by the citizen class, who manifest considerable objection to the military service, from which they cannot now escape by finding substitutes as under the old law. The nomination of the officers by the Crown is also severely commented on by the opponents of Government. The constitution lately abrogated made the officers elective; but the charter, it seems, lays down no rule on the subject. The chief point of difference remaining to be settled between the Pope's nuncio and the Government, is the nomination of the vicars-general who administered the dioceses of the expatriated Miguelite bishops. The Government offers to allow the latter pensions to reside abroad, but the Pope requires that, if not allowed to return, the vicars-general in their place shall be nominated or confirmed by him. The establishment of the nunciatura, or ecclesiastical court, has not been insisted on, and it is expected that M. Capaccini will moderate his pretentions, so that everything will be satisfactorily arranged. The Prince lately born had been privately baptised by the name of John. M. Capaccini had not yet received his procuration from the Pope as godfather; but when it arrives, the ceremony, it is understood, will be repeated on a grand scale.

Germany.—The German papers contain little news of interest. Private letters received from Vienna give some confirmation to the reports, which have some time been in circulation, and which state that it is the intention of the Austrian Government to introduce modifications in its tariffs, with the view of preparing the way for accession to the Zollverein, or at least of concluding a commercial treaty with that union. These letters add that there is reason to believe that these changes will be known in the course of a few months. Accounts from Berlin, dated the 26th ult., inform us that the King will inspect in the autumn the 4th corps of the army at Magdeburg, the 7th at Munster, and the 8th at Cologne; that he will be accompanied by all the princes of the royal family, and that several foreign reigning princes and persons of distinction are expected. The Prince of Prussia is expected to return from St. Petersburg by that time. It is stated that accounts had been received from Russia, announcing that the Empress would probably come to Germany by August, to use the waters at Ems.—Private letters inform us that a society of scientific and amateur naturalists has been formed at Berlin, under the presidency of the distinguished Humboldt; that it is intended to create a Zoological Garden at the south end of the park; and that the King of Prussia has signified his satisfaction at this institution by granting to it all the animals which were kept in the Island of Peacocks, and has authorised his treasurer to advance about 360,000f., without interest, repayable by ten equal yearly instalments. The marriage of the Princess Aldegonda of Bavaria with the hereditary Prince of Modena took place at Munich on the 29th ult.

Belgium.—Their Majesties with the young Princess left Brussels for Paris on the 27th ult. It is said that this visit is connected with the question of the commercial relations of France with Belgium. The engrossing topic of conversation continues to be the late trial for high treason. The condemned have been visited by the members of their family, some friends, and also by their counsel. The visit of the latter, besides condolence, had reference, it is said, to the appeal against the judgment, which is expected to be entered, and which some consider will be successful on a point of law.

Italy.—Private letters from Rome, dated the 17th ult., state that on that day the Pope went to the Church of Santa-Maria-Maggiore, to join his prayers with those of a crowded congregation, on the occasion of the jubilee which has been ordered relative to the misunderstanding between the Holy See and the Spanish Government, on account of the Church of Spain.—Subsequent letters of the 22d ult. state that for some time past nocturnal attacks have been very frequent in that city. An Englishman who was lately menaced by an assassin, fired at him, and killed him on the spot. The police have not taken any steps against the Englishman, but have advised him for his own security to quit the city. A few days ago, the palace of Cardinal Del Drago was plundered in the middle of the day of a large sum of money and a quantity of jewels, amongst which was a crucifix of diamonds, valued at twenty thousand crowns.—The Princess de Canino and Musignano, the wife of the eldest son of the late Lucien Buonaparte, was safely delivered at Florence, on the 17th ult., of a daughter, who has been christened by the Archbishop, the King and Queen of Sardinia standing as sponsors by their proxy, the Count de Carrega, Chargé d'Affaires. The names of the infant princess are Maria Theresa Albertina.—It is stated, in a letter from Turin, that the announcement of the *fêtes*, which are to commence on the 12th inst., on the occasion of the marriage of the Prince Royal, has brought a great number of visitors to that city, and that apartments are with difficulty to be obtained.

TURKEY.—We have received intelligence from Constantinople to the 23d ult. Hopes were entertained that the difference with Greece would be speedily adjusted in a manner satisfactory to both countries. The Divan continued to be much occupied with the affairs of Syria. News had been received from Beyrout to the 16th ult. Syria continued in a distracted state; robberies and murders are said to be daily occurrences, and the Christians are the chief sufferers. Private accounts add that if a radical reform in the government of the country be not introduced, a general massacre of the Christians and seizure of their property may be expected to take place before 12 months elapse. Deir-el-Kamar had been abandoned by its male population, and Omar Pacha still held Beteddeen, with about 2,000 Turkish troops. The agents of the French Propaganda societies were said to be actively employed exciting the population between Beyrout and Tripoli to revolt, and some accounts state that the natives along that coast had been supplied by them with arms and ammunition. Fears prevailed that a religious war would break out in spring: and it appears to be the general opinion that neither peace nor tranquillity will be restored in Syria until the restoration to power of the former Emir Beshir, or his son, Ameen. These accounts state that Bishop Alexander has received every attention from Tahir Pacha and the authorities of Jerusalem, and that he had been received in the most friendly manner by the Greeks and Armenians. Although no firman had yet been received from Constantinople to authorise the construction of the Protestant Church, hopes were entertained that no objection would be offered to its erection. The people of Mount Lebanon, however, appear to be less favourably disposed towards the prelate; and the chiefs and people of Druse, as well as Christian tribes, are said to have addressed a petition to Omer Pacha, in which they protested against the "English high priest" establishing himself in their mountains, and expressed their conviction that "his presence would prove most prejudicial to the country, and inevitably produce disorder and anxiety in the mountains, and cause ruin and trouble among these subjects who had been intrusted by the Almighty to the keeping of the Sultan."—M. Mavrocordato, the Envoy of Greece, presented his credentials to the Grand Vizier on the 10th ult., and dined with Sir S. Canning on the 15th. Ali Effendi, the Minister of the Porte to England, and Akif Effendi, the Minister to Vienna, left for their respective posts on the 12th ult.; the former is bearer of a present from the Sultan to the Prince of Wales of a beautiful Damascus blade, the scabbard of pure gold, and the hilt of the rarest brilliants.

EGYPT.—Our intelligence from Alexandria is to the 22d ult. Mehemet Ali replied, on the 8th ult., to the collective note addressed to him by the Consuls-General of Great Britain and Austria, on the 3d, respecting the freedom of commerce and Custom duties of the new tariff. In his answer the Pacha admitted that "monopolies were equally prejudicial to the public treasury and the nation, and that circumstances and the fatal necessities of the situation in which he had found himself placed had compelled him to introduce that system into Egypt; he had never relinquished the idea of its abolition, but that it was only towards the close of last year that, becoming free from all foreign pre-occupation, he could devote all his thoughts to commercial liberty and realise one of his most ancient and sincerest wishes." He then contended that "since that period he had thrown open the trade of all the productions of the country, with the exception only of cotton, which he expected shortly to be able to free in a similar manner." He then controverted the assertion of the two Consuls-General, that the treaty of commerce of 1838 was not carried into execution, because the new measure had experienced partial resistance from some subaltern agents and functionaries, and concluded by giving orders to the Custom officers to suspend the levying of the two per cent. additional import duty, against which the Consuls had protested in their note. The Pacha had left Cairo for his Chifliks in the Delta, and was, by the last accounts, at Mansoura, with Ibrahim Pacha. The plague had manifested itself in the palace of the harem of Mehemet Ali at Alexandria, and six of the persons attacked had already died. At Damietta there were two or three cases daily. The disease had also made its appearance at Behera, Sunbrikit, Kafr Sheik, and in 60 villages adjoining the latter. The Imam, or chaplain of the harem, died of the plague at Alexandria on the 21st.

INDIA.—The overland mail reached London, by extraordinary express from Marseilles, on Monday afternoon, bringing intelligence from Bombay to the 1st March. The news thus received is of the most melancholy and disastrous character, and fully confirms the report that accompanied the last mail respecting the entire destruction of our army in Affghanistan. It is now ascertained that of 13,500 men who left Cabul with Gen. Elphinstone, Dr. Brydon is the only European who has been able to reach the shelter of a British fortress. Some 30 or 40 officers and men are announced as prisoners; 14 of our countrywomen are in the hands of the Affghans, and all the rest have been cut to pieces. The following are the details of the slaughter of our troops and of the melancholy events that have transpired subsequent to the assassination of Sir W. M'Naghten, up to which date it will be remembered the authentic intelligence brought by the last mail extended. The negotiations, which were broken off by the murder of Sir W. M'Naghten, were resumed by Gen. Elphinstone and Major Pottinger, shortly after the death of the Envoy. An attack, however, on the cantonments was commenced ere he had concluded any arrangement; but this appears to have been discontinued, as terms of treaty were settled before the end of Dec. The troops are represented to have been on the 25th of that month in camp, unable to move for want of carriage, and to have had nearly a month's supply of provisions, which had been collected during the progress of negotiation. On the 4th Jan. the treaty was signed. It stipulated that on delivering up six hostages, granting orders for the evacuation of our different strongholds, and abandoning the treasure and certain munitions of war, our force should be permitted to march to Jellalabad unmolested, taking with them their arms and ammunition. The sick and wounded were to be left to the care of the "existing government." Shah Soojah refused to accompany the retiring force, and was left in the Bala Hissar, with about three thousand followers, defending himself against the attacks of the enemy. The troops marched on the 6th of January, and the cantonments, as soon as they had quitted them, were set in flames. The Affghans rushed eagerly forward to seize the baggage, and the rear guard of the force was fired upon. When Akhbar Khan had thus got our troops into his power, he issued proclamations, saying, "We, having by our valour and cunning induced the Kaffirs to quit their tents, now call upon all good Mussulmans to rise and annihilate the intruders as they retire!" The force encamped the first night in the snow, which was more than a foot deep, after having marched about four or five miles—half of the way to Bootkhak. As soon as they left Cabul, Gen. Elphinstone placed himself entirely under the guidance of Akhbar Khan, and allowed the order of marching, the length of the stages, and the places of encampment, to be dictated by him. The next day, the 6th, the troops reached Bootkhak, and again pitched their camp in the snow. During their progress, a good deal of plunder seems to have taken place, but no regular attack was made. On the 7th they marched for Khoord Cabul, and during that stage the enemy came down upon them in force, and obstinately disputed the way. They ascended the heights, however, with spirit, and after a severe engagement, which resulted in a serious loss of life, succeeded in forcing the dangerous defile. It appears that on this occasion, and also subsequently when attacks were made, Gen. Elphinstone charged Akhbar Khan with a breach of faith; but the latter protested, and seems to have succeeded in persuading the General that he had no control whatever over the assailants, and could not prevent their attacks.—The next march, towards Tazeen, was by far the most disastrous. On the Huft Kothul, a bleak and precipitous mountain, nearly the whole of the native force was destroyed. The ladies, up to this point, seem to have borne the privations of these terrible marches with heroic fortitude; but here the intense cold, and the imminent danger to which they were exposed, induced them to comply with the request of Gen. Elphinstone, that they should place themselves under the protection of Akhbar Khan and return to Cabul. The Affghan chief, it appears, demanded them as hostages: but though their safe conduct to Cabul was made a condition of their surrender, they were never taken thither; and there is every reason to believe that they accompanied Akhbar Khan as far as Jugdulluck. Having reached Tazeen, the remnant of the army, instead of proceeding on the direct route to Jellalabad, by way of Piazleruk and Gundamuck, turned off towards Jugdulluck, which lies about 25 miles from Tazeen, in the direction of Lughman. The work of slaughter continued, and by the time they reached their destination, not more than 300 men—and these nearly all Europeans—could be mustered, out of 6,500 soldiers and upwards of 7,000 camp followers, who a few days previously had quitted Cabul. Either at Tazeen or Jugdulluck, for on this point statements differ, Gen. Elphinstone himself fell into the hands of Akhbar Khan, a prisoner, as well as Cols. Shelton and Johnson, who were with him at the time. Some accounts state that these officers were seized and confined; others, that they voluntarily surrendered themselves. It appears that Akhbar Khan received intelligence that Jellalabad was still retained by Gen. Sale, contrary to the terms of the treaty, and that he at once declared the force should proceed no further. Whether they were seized, in pursuance of this determination, or delivered themselves up as security for the ultimate evacuation of the fortress, is not yet known. On the departure of Gen. Elphinstone, the command devolved upon Brigadier Arquetil, commander of the Shah's forces, who succeeded in preserving something like order, notwithstanding the dreadful situation of the troops. Towards the close of the day, Brigadier Arquetil received the following warning note from Gen. Elphinstone:—"March to-night—there is treachery!" And soon after dark they again set forward. This was on the 12th Jan. The column advanced up the pass, and, though the road was barricaded, succeeded in pushing through, the enemy not having yet assembled. An attack, however, which was soon afterwards made on the rear, threw them into confusion. The Brigadier fell, and then all order was at an end. The force broke up—the officers were no longer obeyed—and self preservation alone was thought of. Her Majesty's 44th Reg. was here cut up; and the surviving officers, seeing that there was no hope of restoring order, and that the only chance of safety lay in flight, at length quitted the scene of tumult. Six of them, named Hopkins, Harper, Collyer, Bird, Steer, and Brydon, rode off in company. They kept together until they reached Futtehabad, when the three former parted from their companions. Bird was soon afterwards struck down, and Lieut. Steer, when but a few miles from Jellalabad, was obliged to halt, his horse being completely exhausted. He contrived to reach a cave on the roadside, where, it is feared, he perished. As for Dr. Brydon, he pushed resolutely on, and after many hair-breadth escapes from the Affghans whom he encountered on the way, and receiving several severe wounds, he came within sight of the fortress. He appears to have feared to enter Jellalabad, at first, from an apprehension that it might be in the possession of the enemy, and for a time hid himself in a ravine. Near this spot he was seen from the walls of the town, and some officers went out to meet him and bring him in. He was in a state of great exhaustion, his head covered with wounds, and it was some time ere he could give a clear account of the disastrous occurrences he had witnessed. For three nights after the arrival of Dr. Brydon, beacons were kept burning and bugles sounding, at Jellalabad, in order to attract the notice of any fugitives that might be in the neighbourhood; but up to the date of the latest accounts only three more men, all natives, belonging to the Cabul force, had reached the fort, one of whom stated that he had seen great numbers of officers lying dead on the road. Various accounts had been received respecting the state of the prisoners and hostages. Akhbar Khan is said, in a letter received from Major Pottinger, dated January 22d, to be at the fort of Budeeabad, in the Lughman country, where he keeps the following prisoners, viz.:—Gens. Elphinstone and Shelton, Lieut. Mackenzie, Capt. and Mrs. Anderson and child, Capt. Boyd, Lieut. Eyre, Lieut. Waller, Mrs. Trevor, Lady Sale, Lady Macnaghten, Mrs. Sturt, Mr. and Mrs. Ryley, Serj. and Mrs. Wade, Capts. Troup, Johnson, and G. P. Lawrence, and Major Pottinger. There are, besides, the six officers and the sick who were left at Cabul on the departure of the troops. Akhbar Khan, in the letters from that fort, which are received unsealed, is described as doing everything "to make them comfortable!" and the "Times" states that "private letters of excellent authority have been received which leave no doubt that the ladies and other prisoners are kindly and respectfully treated, and that where the ladies have been accompanied by their husbands they have been allowed to remain with them." General attention in India appears now to be fixed on Gen. Sale, who, with 1,500 men and about 1,000 armed camp followers, was shut up in Jellalabad. The Affghans had made no further attack on the fort, which Gen. Sale has fortified with a ditch, and planted cannon in different places, with a determination to defend his position to the utmost. Akhbar Khan has attempted to raise the Ooloosees, or heads of the neighbouring clans, in order to attack Jellalabad, but hitherto without success. It was on the 9th Jan. that the orders to evacuate Jellalabad arrived from Cabul; they were contained in a letter from Major Pottinger, addressed to Capt. M'Gregor, the political agent. It was at once resolved to decline compliance, and a despatch was sent off, explaining the reasons for this determination; one of the principal of which was, that certain information had reached them of Akhbar Khan having sent emissaries to induce the tribes around and near Jellalabad to rise and destroy the British force on their contemplated retreat to India. A letter at the same time was addressed by Akhbar Khan to Gen. Sale, declaring that the hostages at Cabul would be sacrificed if he continued in occupation of Jellalabad, and that he should then be driven out, and his whole force annihilated. The general is said to have replied, "No: I have more than any other man, a wife and daughter, at stake, but these cannot influence me; this post is to be defended with my life, and without a peremptory order from the Governor General in Council I will surrender it to no man." He at the same time added, that they defied the Affghans to put their threats into execution, and that a hundred lives should be taken for every hostage they might kill. Ten thousand rupees were proposed by Gen. Sale as the ransom of his wife and daughter, but no reply from Jubber Khan, to whom the offer was made, had yet reached him. Lady Sale, the accounts state, has acted most heroically—her every letter to her husband counselling him to be bold and determined, and to hold out to the last.—Col. Wild, commanding a brigade which was sent from the Sutleje early in December, had reached Peshawur, and had made an attempt to force the celebrated pass called the Khyber, in order to relieve Gen. Sale: having, however, left their artillery behind in India, and the only guns procurable in that direction being unserviceable ones from the Sikhs, the attempt had proved unsuccessful. Two regiments penetrated to the fort of Ali Musjid, where a British garrison was stationed; but as they found neither provisions nor ammunition there, they were obliged to retreat towards Peshawur, having lost an officer and some men. In the mean time the Supreme Government has taken active steps to meet the emergency. Gen. Pollock has been despatched at the head of a considerable reinforcement towards Peshawur, which he reached on the 7th Feb., with sufficient guns and abundant ammunition, and was then making preparations for proceeding through the Khyber pass. An attempt of the insurgents to seize Ghuznee is said to have been so far successful that the town is in their power; but Col. Palmer, with his regiment and six months' provisions, is stated to be safe in the citadel. At Candahar an insurgent force showed itself on the 10th Jan., when an attempt was made to carry off some camels, and on the 11th, Prince Suftur Jung, the youngest and favourite son of Shah Soojah, and Mahommed Atta, the chief, came with a large force within about five miles' distance. Gen. Nott marched against them on the 12th, and in a short time dispersed the whole with a trifling loss. The Supreme Government, on the 31st Jan., published a proclamation admitting the fact of the convention at Cabul, the retreat of the troops, and their having suffered extreme disaster in consequence of treacherous attacks, and declaring that the most active measures had been adopted, and would be most steadily pursued, for expediting powerful reinforcements to the Affghan frontier for assisting such operations as may be considered necessary for the maintenance of the honour and interest of the British Government in that quarter. At the conclusion of the proclamation, the Governor-General states that he regards this partial reverse only as a new occasion for displaying the stability and vigour of the British power, and the admirable spirit and valour of the British-Indian Army. Orders were also published on the 5th Feb., for the purpose of having a 10th company added to every regiment in India, which, with other measures adopted, will cause an increase of about 26,000 men. —The latest intelligence from Cabul is, that Shah Soojah had succeeded in securing the good-will of all the chiefs. Akhbar Khan had no longer any power in Cabul, and was, it is said, sent to attend the "Feringees" in their retreat in order to get rid of him. He, however, retains the hostages and prisoners, for whom, it is expected, he will demand a large ransom. His father, Dost Mahommed, is strongly guarded, in order to prevent his escape from India. It is reported that Shah Soojah was implicated in the late insurrection, which appears to have been exclusively directed against the foreign infidels.—From the other parts of India we learn that there have been some serious disturbances among the Madras regiments at Secunderabad, in the Nizam's country, in consequence of the Court of Directors having ordered that the allowance of batta latterly granted should be discontinued. The soldiers of some of the best regiments refuse to obey their officers, stating that it would be better not to be in the service than to starve or have their families starve, as the allowances granted on removing them 320 miles into the Nizam's country had been refused. The mutiny had been put down, and many of the soldiers were placed in confinement. The other parts of India are comparatively tranquil, but great excitement appears to prevail in different quarters, and the inhabitants of Delhi and other towns in that direction had begun to hide their money and jewels as if they apprehended danger. The Nepaulese seem occupied with their own affairs. The King of Oude had made arrangements for resigning the throne, but has been dissuaded by his chief Minister from effecting his purpose. Some confusion is expected in that country. The Siekh expedition into Thibet has been routed, and its leader, Zorawur Singh, slain. A treaty was made with the Chinese, who took the arms from the Siekhs, who afterwards died of cold and starvation. A number of men, under a leader named Bustee Ram, effected their escape through the Byansee Pass, so as to reach Almorah. The leader and 130 men succeeded in obtaining the protection of the British authorities there, and have been since sent on to Loodianah. Forty of them remained in the hospital. Numbers have perished. The expedition of Tharawaddie to Rangoon has failed, and he and his Court have left that place. His troops have lost 3,000 men by their works there, and they are disappointed, it is said, that all their great hopes have failed. The King of Siam is described as much alarmed lest Tharawaddie should obtain arms and ammunition from the English in order to attack his dominions.—Lord Auckland had made preparations for his voyage to Europe on board the Hungerford, a large trader from Calcutta; and an express had reached Bombay just at the departure of the mail, announcing the arrival at that presidency of Lord Ellenborough, the new Governor General.

China. — Our intelligence from China is not satisfactory. The latest news from Macao is dated Jan. 17. The British expedition there appears to be waiting for reinforcements from England and India. The Chinese were collecting large bodies of troops near Ningpo, and Sir H. Gough was of opinion that the force at his disposal was not sufficient to hold the city in the event of its being attacked by a large body of the enemy. The admiral immediately sent the Jupiter to Hong Kong for reinforcements, and this vessel accordingly came to the latter place, and embarked about eight hundred Europeans, with whom she has sailed to the northward. H.M.S. Cornwallis had also proceeded from Hong Kong to join the expedition. The British Naval Commander at Hong Kong was continuing the seizure of the Chinese junks. The Chinese at Canton were busy in making the defences of that river as effective as possible, and have the assistance of three Dutch engineers, for whom they sent a junk to Java some months since. It is not stated if those engineers belong to the Dutch army, although it is presumed that they do.—Letters have been received from Chusan to the 24th Dec., and from Amoy to the 2d Jan. All was then quiet at those places. The crew of the Madagascar steamer, who were captured by the Chinese on the destruction of that vessel by fire, have been brought down to Macao and released. The Chinese appear to have been under the impression that they were Americans, which, it seems, was the account the crew gave of themselves. They had not been badly treated.

United States.—By the Hibernia packet-ship we have accounts from New York to the 17th of March: they add, however, little to the information brought by the last arrival.—The discussion in the House of Lords on the case of the 'Creole' was exciting a good deal of attention, and, it was expected, would give rise to some proceedings in Congress.

Parliament.

HOUSE OF LORDS.

Thursday.—The House met for the first time since the Easter recess. After the presentation of petitions, the Earl of Ripon moved the first reading of a bill to amend the laws relating to merchants and factors, which was agreed to.

The Forged Exchequer-bills Bill, the Irish Spirits Duties Bill, and the Public Works and Fisheries Bill, were brought up from the House of Commons, and were respectively read a first time.

The Ecclesiastical Residences Bill went through committee.

The Duke of Argyll withdrew the notice of a motion he had given with reference to the introduction of a measure for the adjustment of the disputes in the Church of Scotland, until some discussions which he expected should have taken place in the House of Commons upon the subject.—Lord Campbell was happy to hear that the notice of the motion alluded to was postponed by the noble Duke, and he would have been still more happy to have heard that it was altogether withdrawn. He trusted that the noble Duke would abandon all idea of legislating upon the subject. He was heartily glad that no measure of the kind had been brought forward by the late administration, for taking as he did the most lively interest in the affairs of the Church of Scotland, he believed that no good could arise from the introduction of any legislative measure, having for its object the settlement of the existing differences in the Church.—The Duke of Argyll would only say that he completely differed from the views of his noble friend upon the subject.

The second reading of the Forged Exchequer-bills Bill was fixed for Tuesday.

HOUSE OF COMMONS.

Monday.—The House reassembled this day after the Easter recess.—Mr. P. M. Stewart brought up the report of the Weymouth Election Committee, announcing the decision to be, "That Viscount Villiers and G. W. Hope, Esq., were not duly elected to serve in this present Parliament, and ought not to have been returned; and that R. Bernal, Esq., and W. D. Christie, Esq., were duly elected, and ought to have been returned."—The Speaker acquainted the House that he had received a communication from the parties to the petition against the return for the county of Wicklow, stating that it was not their intention to proceed with the petition. The order on the petition was therefore discharged. Several petitions were then presented, after which Mr. R. Currie inquired whether it was to be understood that Ministers, who had declared that they would stand or fall with the Income-tax, intended that declaration also to apply to the new tariff?

Sir R. Peel said he should reserve to himself, as he had always done, the right of modifying the details of any of the measures he had introduced, if this should be found necessary, but stated it to be his intention to uphold the tariff in all its leading principles. In reply to some observations from Lord J. Russell, Sir R. Peel stated that communications between himself and various trades affected by the tariff were still going on. He thought that by Monday next these communications would have terminated, and that he should in that time be enabled to lay the amended tariff on the table.

On the motion of Sir R. Peel, the House then resolved itself into committee on the Exchequer-bills Frauds Bill.—Sir T. Wilde moved amendments on several sections; and proposed two additional clauses, one for enabling the claimants to be heard by attorney or counsel, and the other for compelling an early report from the Commissioners.

The Solicitor-General stated it to be the intention of Government that the evidence in general should be reported; but as there might be particular cases in which the publication of the facts might be inexpedient, he would rather not make the bill compulsory in this respect. He thought there might be much inconvenience and delay in giving a general right of being heard by counsel. After some remarks from Sir R. Inglis, who urged the necessity of despatch,

Sir R. Peel acceded to the general principle of giving publicity to the evidence, but wished to allow to the Commissioners, as being men worthy of all confidence, a discretion both as to this point and as to the circumstances in which counsel should be allowed.

Lord J. Russell thought that the Commissioners ought to report the whole to the Treasury, and that the Treasury, and not they, ought to determine what should or should not be published. He contended for allowing the liberty to be heard by counsel, wherever the claimants might desire it.—The Attorney-General argued that the multifarious and unlimited character of the inquiry would make it extremely inconvenient to allow an absolute right of being heard by counsel. A lengthened discussion on this point ensued, in which several Members joined.—Sir T. Wilde pressed his amendment, on the ground that complete justice would not otherwise be done to the holders of these bills, and a division took place, when the amendment was lost by 77 to 64. The bill then went through committee, and the House resumed.

Sir R. Peel moved that the House should resolve itself into Committee of Ways and Means.—Mr. Blewitt declared that the country had received the proposition of the Income-tax with universal execration, though it had been tried to make it palatable by an amended tariff, and concluded with a motion that the House should not resolve itself into a committee on the Income-tax until it had been ascertained what amount of relief would be given to the country by the proposed commercial and financial reforms.—Mr. S. Crawford supported the amendment.—Mr. T. Duncombe said a notion had gone abroad that the tariff was likely to be postponed: he wished to know whether it had ever crossed the mind of Sir R. Peel to postpone it?

Sir R. Peel said it had not, except for the purpose of consideration. The tariff, so re-considered, would be ready on Monday, and he trusted it would not be found by the House to require further alteration in any material respect. Beyond that short and necessary period he had never thought of postponing the subject. There was a general impression that the sooner the public should definitively know what the financial and commercial measure was to be, the greater would be the advantage to the national interests. He hoped, now that the holidays had given time for the explosion of popular indignation with which he had been threatened, that there would be no further delay in the preliminary vote on which that measure was to be founded.—Mr. E. Ellice, though he disapproved of the Income-tax, would not obstruct the regular course of business in that House, and therefore could not support the amendment.—Mr. T. Duncombe explained, and after a few words from Sir R. Peel, Mr. Blewitt withdrew his amendment, and the House went into committee. —The first resolution was then passed without a debate.—On the second resolution, Mr. M. Gibson said he saw no reason for hoping that the proposed Income-tax would be a merely temporary imposition; for the alteration in the tariff would, he thought, never make up the deficiency. Perhaps there were further commercial reforms in view; if so, he wished they had been brought forward now, while the country gentlemen were yet subservient to the new Government. He knew not, however, why there should not be a Property-tax, permanently superseding all other taxes. The people could not pay public taxes, and also taxes for the benefit of particular classes. To the inequality of an Income-tax he wholly objected; it would lead to evasions and frauds, and so to the employment of spies for the counteraction of them.—Mr. Wason here interrupted the speaker, and saying he rose to order, complained that the Chairman had put the first resolution, and declared it to have been carried, without permitting the hon. member for Dover to address the committee, for which purpose he had risen.—Mr. Greene, the chairman, said that he was not aware that any hon. member had risen.—An animated discussion ensued, in the course of which Sir R. Peel and other hon. members declared that they had distinctly heard the question put by the chairman, while several other members stated that they had not heard it. Sir R. Peel admitted that it would be unfair to assume that the resolution had passed without opposition, but said they could not then retrace their steps.—Mr. Rice then said a few words, intimating his disapprobation of the principle of an Income-tax. In consequence of some further observations from Mr. M. Gibson, Sir R. Peel explained, that though he adhered to his opinion in favour of the principle of an Income-tax, and intended to do his best for the purpose of obtaining a vote to that effect, he had never said that he would throw up his measure rather than allow of any alteration in the details of it. He had never stated nor intended anything so disrespectful to the House.—Mr. Wallace objected to an Income-tax, on the ground of the inducement it would hold out to commercial men to overstate their incomes. After some words from Mr. Christmas, in support of the resolution, Mr. Wakley expressed his opinion, that as the first resolution, affirming the Income-tax, had already passed, there should be no division on the second and minor one. He wished to know why a provision was made for the farmers, exempting them from that scrutiny to which all the trading interests were left liable—a provision exempting them from all payment upon the income of any farm rented below 300*l.* a year, and limiting their liability on any higher rent to one half of its amount. Great reductions in the import duties were about to be made, from which the working people would suffer severely; for the right hon. Baronet would thus bring various foreign articles into the home-market without at all lowering the price of bread to the manufacturers of the same articles in this country.—Mr. Wortley said, the answer to Mr. Wakley's question was, that in the case of the farmer there was a test of income, which in the case of the trader was not to be obtained. But he must say that the farmer would rather submit to any scrutiny than to the heavy tax which this test imposed upon him.

Sir R. Peel observed, that the opposite opinions expressed by Mr. Wakley and Mr. Wortley were some evidence that Ministers had endeavoured to steer a middle and a fair course. In answer to Mr. Wakley, he referred to a representation which he had that day received from a numerous body of farmers, desiring to be taxed like persons in other lines of business, rather than by the proposed test. Among the farmers, however, as well as through the country in general, he found a strong disposition to make an exertion for the maintenance of public credit; though it was observable that each class remonstrated a little against the particular mode in which itself was taxed. He had never promised, as some apprehended, to propose the removal of this tax at the end of three years: he had, indeed, framed the present measure for three years only, but he had, on its very first introduction, expressed his hope that at the expiration of that term it would be continued by Parliament for a couple of years longer, by which time he trusted that the benefits of the tariff would have come into full operation. He repeated his conviction that much relief would meanwhile be derived to all classes from the greater cheapness of living; and he exhorted the House not to diminish the efficacy of so important an instrument as an Income-tax by qualifying it with exemptions.—Lord J. Russell felt the inexpediency of so qualifying the Income-tax; but he also felt that very inexpediency as a strong argument against imposing it at all. Sir R. Peel, he said, had pointed to the alarm which prevailed amongst the farmers, as a proof that his measures were calculated to benefit the consumer by lowering the cost of food. But one cause of the alarm was the suddenness of the propositions, which had not been expected by the farmers from those who proclaimed themselves their friends—they were following the front rank of their own army, which had turned round and fired on them. Seeing that the first resolution had been unwittingly carried, he did not see any advantage of taking a division on the second, but he would take the sense of the House on the bringing up of the report.—The Chairman requested permission, before he put the second resolution, to say that in putting the first he had not been aware of the intention of any member to address the chair.—Mr. Williams said a few words; after which the second and third resolutions were passed, without a division, and the House resumed.

The Drainage (Ireland) Bill was read a second time. Committee on Monday.

The reports of the committees on the Mutiny Bill and Marine Mutiny Bill were received and agreed to, and the bills ordered for third reading on Friday.

Tuesday.—Mr. R. Bernal and Mr. W. D. Christie took the oaths and their seats for the borough of Weymouth.

The consideration of the report of the Southwark Improvements Bill (No. 2), brought up by Lord J. Manners, was postponed in pursuance of an amendment moved by Mr. R. Palmer, that the report on No. 1 Bill should be first received, the division on the question being, for the original motion 5, and for the amendment, 36.

Mr. M. Sutton obtained leave to bring in a bill for the better regulation of turnpike trusts. The chief features of his proposed measure were the continuance of local turnpike acts for forty-one years, and the restricting turnpike trustees from contracting fresh burdens on their trusts without the sanction of the executive government.

Lord Eliot brought in a bill for the better regulation of the Irish fisheries.—Sir V. Blake obtained leave to bring in a bill to alter the mode in which barristers are admitted to practice in Ireland.—Sir G. Clerk obtained leave to bring in the Annual Indemnity Bill.—The Parish Property Bill was then read a third time and passed.

The House then went into committee on the Corn Importation Bill.—On the 5th (the average clause) being proposed, Mr. Barclay, in consequence of an intimation from the chairman that this would be the regular course, postponed, until the schedule of towns came under discussion, an amendment which he intended to move against the proposed addition to the places from which returns are now received.—Mr. Childers then raised the same question by another amendment, worded differently so as to meet the objection of the chairman.—It was opposed by Sir R. Peel, and a long discussion ensued, during which the points argued were whether or not the additional number of towns would prevent the frauds which are alleged to take place in the returns from which the averages are now struck; and whether or not these additional towns would have the effect of lowering the average prices, and thereby, by keeping up the rates of duty, giving additional protection to the landed interest. Another point was, what effect the quality of the wheat, varying, as it did, with the seasons, had on the average prices.—Mr. Hawes asserted that the towns proposed to be added had been purposely selected from districts producing low-priced corn, in order to keep down the rate of the averages. This was denied by Mr. Gladstone and Sir E. Knatchbull, who severally vindicated the intentions of Government.

Mr. Villiers desired to know with what other object those towns had been selected, in a bill the aim of which, he said, was notoriously to keep up the rents of the landlords? He would not entertain the notion of treating the measure as a concession or a settlement; he considered that it was merely a confession of the error in which the opposite party had heretofore persisted; and it would be the people's business to go on agitating till they obtained a real relief.

Mr. Labouchere, with reference to an opinion formerly expressed by him, admitted that he had much overrated the extent to which the averages were likely to be reduced by the enactment

[illegible]

[illegible]

for the purpose of maintaining the prices of food. Sir R. Peel, he said, had avowed this to be the object of the Corn Bill; and in thus legislating, principles were applied to the trade in corn, which worked gross injustice to all other branches of the trading and commercial community.

Sir R. Peel hoped that Mr. Cobden would not consider that he was treating him with disrespect if he declined entering on the subject. The motion was tantamount to raising the entire question which had been so repeatedly discussed. Mr. Huskisson had been referred to by Mr. Cobden, but the opinion of that statesman, up to a late period of his life, had been in favour of a graduated scale of duties.

Lord J. Russell compared what would be the probable operation of a fixed duty with that of a graduated scale, and declared his conviction that the measure before the House would not stand as a permanent one. The time was not far distant when a sliding scale would be abandoned altogether, and sounder principles be applied to the trade in corn.—Mr. Villiers expressed his unqualified condemnation of the bill before the House.—Sir J. Trollope explained and defended the course pursued by the representatives of the agricultural constituencies, in reference to this measure. He supported Sir R. Peel on the ground that he considered the interests of agriculture better than the noble Lord and his colleagues had done.—A long and desultory conversation ensued, in which Mr. Ward, Mr. Darby, Mr. Wakley, Mr. Blackstone, Lord Worsley, Mr. R. Palmer, Mr. Fielden, Mr. Brotherton, and Sir V. Blake took part; after which the House divided, when the motion was rejected by [illegible] to [illegible].

On the question that the bill be read a third time being put, Mr. Hawes moved the adjournment of the third reading until Monday. The House divided, when there appeared—For the adjournment 58; against it, [illegible]. While strangers were absent from the gallery, another division took place on the third reading of the bill, Dr. Bowring opposing it, when it was carried by 229 to [illegible].

Mr. Ferrand then moved a clause, "That so much of the act as allowed the importation of foreign or colonial flour into Ireland" should not take effect till six months after the passing of the bill.—Sir R. Peel opposed the clause, and after a brief discussion, Mr. Ferrand withdrew it.

Mr. A. Johnstone brought forward another clause to permit damaged foreign or colonial flour, unfit for human food, to be taken out of bond for manufacturing purposes, at a duty of 1d. per cwt. It was seconded by Mr. M. Philips, and, after a short conversation, negatived without a division.—Mr. Wakley proposed that damaged grain, unfit for food, should not be included in the returns for making up the averages. After some observations from Sir R. Peel and one or two other members, it was withdrawn.

On the question that the bill do pass, Mr. Cobden denounced it as a robbery of the poor, and Mr. [illegible] threatened to move an adjournment of the House. The question was, however, put that the bill do pass, and was carried in the affirmative.

In reply to a question from Mr. Hawes, Mr. Gladstone said that London would be included in the averages.

The Municipal Corporations Bill passed through committee.

Friday.—Lord J. Russell began the debate on the Income tax. He moved as an amendment a resolution affirming that the estimated deficiency of income to meet expenditure might be supplied by a better arrangement of the duties on corn, sugar, timber, and coffee, and by a reduction of the protecting and differential duties; and that it is not advisable to renew a tax, inquisitorial, unequal and hitherto considered as a war reserve. Mr. Goulburn replied; and after some remarks from Mr. Williams, Sir R. Inglis, Mr. P. Stewart, Mr. Sheil, &c., Sir R. Peel took a lengthened review of the financial condition of the country, contending that the Income-tax is less objectionable than any addition to the assessed taxes; and that the present high price of the Funds is caused by the prospect of this very tax, and to the confidence that Parliament will maintain public credit. At the close of the right hon. Bart.'s speech, some conversation took place, when the debate, on the motion of Dr. Bowring, was adjourned.

CITY.

Money Market, Friday.—Consols for money and the account closed 90⅞ to 1; Bank Stock, 166½ to 167½ ex div.; Three per Cent. Reduced, 90 ex div.; Three-and-a-half per Cent. Reduced, 99 to ⅛ ex div.; New Three-and-a-half per Cents., 100⅛ to ¼ ex div.; Exchequer-bills, 36s. to 38s. premium; and India Bonds 14s. to 16s. premium.

Metropolis and its Vicinity.

Metropolitan Improvements.—The new entrance to Hyde-park, to be called the Albert Gate, was opened for the convenience of the public on Wednesday morning. The handsome erection which is to bear the name of his Royal Highness is not yet commenced, but in its place are two lofty wooden gates. These will in future be opened and shut at the same hours as the other gates leading into Hyde-park. Of the Cannon Brewery, part of which had to be removed to make room for the above-mentioned entrance, nothing is left but the front wall, which will remain standing until the White Hart, an adjacent public-house, and other contiguous property are vacated and pulled down, which will not be till Midsummer, and then it is proposed to simultaneously commence the new crescent and the Albert Gate.

Common Council.—At a special Court of the Common Council of the City of London, held on Tuesday, the Lord Mayor in the Chair, it was moved that the report of the Thames Navigation Committee be adopted. A long conversation ensued upon the subject of the proposed improvements of the banks of the river, which formed a principal feature in the report. Sir P. Laurie said, the plan, as detailed in the report, had been laid before the Trinity-house, and had been considered by it a perfect plan. That being the opinion of the Elder Brethren of the Trinity-house, he thought the sooner they agreed to the report the better. Mr. Stevens said, the committee had gone through a great deal of labour, and having read the report carefully, he was delighted at the large measure of improvement therein contemplated. If the plan were carried into effect, the present nuisance caused by throwing out piers and chains of boats would be rendered unnecessary. By the conclusion of the report, it would be seen that the committee required authority to remove such nuisances as were injurious to health and offensive to the sight, and by agreeing to the report they would only be sanctioning all that the committee had done. After some conversation, an amendment was moved by Mr. Pewtress, expressing the agreement of the Court to the line laid down by the Commissioners in their report for the embankment, and referring it back to them that it might be carried into execution. The amendment, however, after some discussion, was withdrawn, and the original motion carried.

unanimously.—The attention of the meeting was afterwards occupied with the subject of the existing distress in the country, when Mr. J. A. Taylor moved that an address be presented to her Majesty "praying her to refuse her sanction to any tax upon articles of food, or to restrict their free importation." This resolution he supported at considerable length, and Mr. Hepple briefly seconded it. It was opposed by Mr. Gadsden, and by Mr. Dawson, who denounced the movement as a political one; and after some remarks from Messrs. Johnson, Maitland, Anderton, &c., the Court divided, and the motion was carried by a majority of 26.

East India House.—It is stated that active exertions are in progress at the India House, as well as at the Horse Guards, to forward, without delay, troops to reinforce the army in Affghanistan. Within the last week the East India Directors have accepted tenders for fifteen ships of large tonnage, which have been surveyed, to proceed to India, to carry 4,000 men. One of these ships will, it is said, take in troops, and leave in a few days, and the whole are expected to take their departure in less than a fortnight. The regiments proceeding to India are the 10th, the 29th, the 58th, the 61st, and the 78th Infantry; and it is understood that from 8,500 to 9,000 troops will be sent immediately to reinforce the British army in that country.

Public Meetings.—On Wednesday a public meeting of the rate-payers of the parish of St. Marylebone took place, for the purpose of taking into consideration the bill now before Parliament, having for its object an alteration of the local act by which the parish is at present governed, and to devise means for opposing it at every stage. Lord Nugent was in the chair, and the borough members and a number of vestrymen and directors of the poor of the parish were present. The chairman having briefly stated the object of the meeting, several gentlemen spoke against the measure, contending that it was only introduced for the purpose of restoring the old system, and to encroach on the rights of the rate-payers. It was urged that by the bill the best clauses of Sir J. Hobhouse's Act would be repealed, and all the power of choosing vestrymen vested in a few of the aristocracy of the parish. Their opposition had done some good, for the promoters of the bill had withdrawn the clause which was to raise the qualification. Resolutions were then passed deprecatory of the measure.—On Wednesday an adjourned special meeting of the shareholders of the Polbeen Tin and Copper Mining Company was held, for the purpose of dissolving the Company. It appeared that the sixth and last call of 10*s.* per share was only paid on 95 shares, and that the original number of 6,000 shares had been reduced by forfeitures to 1,725. The ore sold since June last amounted to 216*l.* only, whilst the outlay was 584*l.*, and the liabilities of the company were 272*l.* 15*s.* 10*d.*; but the steam-engine and materials at the mine were reckoned worth about 1,400*l.* The total sum paid by the proprietors was 23,000*l.*, and the ore sold has amounted to 13,000*l.* In answer to a question from a shareholder, the secretary said that there was no money given for the mine in Cornwall, but the price (6,000*l.*) was taken out in shares, one-half of which was taken by the old, and the other half by the new proprietors. After some conversation, a resolution was passed unanimously for dissolving the company, returning the sixth instalment to the shareholders who subscribed, and also to empower the directors to dispose of the available property of the company for the benefit of the proprietors.

Metropolitan Antiquities.—The curiosity excited by the singular discovery of gold and silver coins near the Archbishop of Canterbury's palace at Lambeth, noticed in our last, continued during the early part of the week; and hundreds of persons, it is said, were occupied daily as soon as the tide receded, exploring the bed of the river in the vicinity of the spot. They, however, met with but partial success, and only a few small coins have been found since the first day of the discovery. The handle and bowl of an ancient golden spoon were found, and also a small spiked wheel, having the appearance of the rowel of a spur. On Monday four small silver coins of the reign of Henry VIII. were dug up; but though a great number of men and boys have been busily employed carefully examining the earth fronting the Lollard's Tower, their search has since proved fruitless. It is thought singular that although all the coins are of nearly the same reigns, they have been discovered in patches far apart from each other; and this, it seems, the tide could not have effected, as they were all embedded in the gravel.

The City Prisons.—During the past week the magistrates are said to have been obliged to commit persons to Newgate for petty offences, because there was no other prison to which they could be sent on a summary conviction. By a return made on Saturday, it appeared that the number of inmates in Bridewell was 139, there being only accommodation for 118, so that 21 were obliged to have beds placed in the passages of the prison. It also appears that there is a similar want of room in the Giltspur Compter.

Murders.—A murder, attended with circumstances of unusual atrocity, and which has occasioned general sensation in the neighbourhood, has been committed on Putney-heath, in the hamlet of Roehampton. The particulars are of a revolting character, and are only equalled by the murder of Hannah Brown by Greenacre, and that of Mr. Paas at Leicester. The crime was committed on the premises of Mr. Shiell, of Granard Lodge, in Putney Park-lane, a bye road, running out of the road from Putney to Roehampton, and about a mile and a half from the former village. The murderer is named Daniel Good, a coachman, in the service of that gentleman, and the person murdered is a female, at present unknown. It seems that Good called on Wednesday at a pawnbroker's shop in Wandsworth in his master's chaise, for the purpose of buying a pair of trousers; having made his purchase, he was perceived by a boy in the shop to take from the counter another pair, which he concealed in the chaise. On being charged with the theft, he denied it, and would not allow the shopkeeper to search the carriage, but immediately drove off. A policeman was then directed to go after him, and take him into custody; he accordingly proceeded to Mr. Shiell's residence, where Good voluntarily surrendered himself, and said he was willing to go with him and arrange the matter, as he had only one pair, which he had fairly bought. The constable, however, persisted in examining the premises, and during his search went into the stables; in an obscure corner of which he found, under a quantity of hay, the mutilated remains of a female body, from which the head and extremities had been cut off. During this examination Good manifested great uneasiness, and wished to put a stop to it by saying he would go with him at once, and arrange about the stolen article. As soon as he perceived the discovery was made, he rushed out of the stables, locking the door after him, and thus succeeded in making his escape in the direction of Putney. On a further examination, the remains of a fire were found in another part of the building, among which several fragments of bones were discovered, almost entirely burnt, but still sufficiently perfect to enable the surgeons to pronounce them to be those of a human body. The man has not yet been apprehended, although the police are actively engaged in tracing him. The inquest on the body is adjourned.

Chelsea.—The two men, Carter and Hillier, charged, as reported in our last, with having despoiled the coffins deposited in the catacombs of St. Luke's Church, in this parish, have undergone another examination. The office was crowded with persons anxious to hear the result of the proceedings. Hillier, the principal gravedigger, was at once discharged, as it appeared that he was innocent of the charge. From the evidence, however, of a number of witnesses, principally tradesmen, who proved that they had bought at different times, of the assistant gravedigger Carter, articles of brass and lead belonging to different coffins, the charge was brought home to that prisoner, and, having nothing to say in his defence, he was committed to take his trial.

Mortality of the Metropolis.—The following is the number of deaths in the metropolis, from all causes registered, in the week ending Saturday, March 26:—Males, 407; females, 363: total, 770. Weekly average, 1838-39-40-41: males, 467; females, 445: total, 912.

Provincial News.

Bristol.—A general meeting of the creditors of Messrs. Acraman, Morgan, and Co., was held in this city on Monday. A satisfactory statement was made of the affairs of the concern; and it was unanimously resolved to give the partners time, to complete their existing contracts, to the 31st Dec., and to wind up the concern under the inspection of five gentlemen named. The liabilities of the firm were stated at 156,000*l.*, and the assets at 184,000*l.*, exclusive of capital invested and borrowed by the partners, amounting, it is said, to a considerable sum above their original capital. It appears that at one time the establishment was paying 1,200*l.* a week in wages alone.—A serious murder, followed by the suicide of the supposed murderer, has been committed at Kingswood, a village five miles from this city. The name of the murderer is Cook, and the person he destroyed was his own sister. They were both unmarried; had lived together for some years, and both had been observed to be industrious and inoffensive. They were of penurious habits, and in the box of the female were found eight sovereigns and 50*l.* in silver. The cottage in which they lived was about 150 yards from any other dwelling. The circumstances connected with the transaction appear to be wrapped in considerable mystery. An inquest has been held, when from the evidence it appeared that some neighbours, hearing cries of murder, proceeded to the dwelling of deceased, and found the sister lying in the garden quite dead, and at a short distance from her the brother in a dying state, holding in his hand an open razor, with which the double crime is supposed to have been committed. On the arrival of the neighbours, the brother was just able to mutter that he was the perpetrator of the crime, when he expired. The evidence served to throw no light on the affair, except that deceased were known to have been occasionally not on the best terms together, and the man had been observed to be in a low state of mind for some time. The jury, after two days' investigation, returned a verdict of wilful murder against the brother.

Chelmsford.—A meeting of the agriculturists of the Chelmsford Farmers' Club has been held here, for the purpose of petitioning Parliament against the alterations proposed by Government, as regards the importation of corn and cattle. The meeting was attended by Sir J. Tyrrell, Bart., M.P., Major Beresford, M.P., and a large body of the leading agriculturists of the county. Both the county members addressed the meeting, their conduct in voting for the present propositions having, it seems, been called in question at a former assemblage of agriculturists. Sir J. Tyrrell urged that the present Government should be kept in power, that the Whigs would propose a worse Corn Law—and that after all, the agriculturists would not be so greatly injured as they seemed to fear. He proceeded to say that they had lost their leaders, and their general officers had been killed off. They had lost the Duke of Buckingham at one time because he was in office; they had then the Duke of Richmond to fall back upon, but the Duke of Richmond, he said, had stated to him, in reply to a question on the subject, that he could not say he liked the measure proposed by Government, but he thought that the agriculturists had better take it. Sir J. Tyrrell then proceeded to say that there was Lord Stanley, and Sir J. Graham, and others, whom they looked up to as the great supporters of agriculture; but they were Members of the Cabinet, who said they were prepared to stand or fall by the proposition. He concluded by saying that they, as agricultural members, were placed in a painful and disagreeable situation. After several other gentlemen had addressed the meeting, the following resolution was adopted, and a petition to the House of Lords founded on it:—"That the meeting views with alarm and regret the alterations proposed in the Corn Laws and the tariff, and the removal of the prohibition on foreign horned cattle, sheep, and swine, and the reduction of the duty on seeds, starch, tallow, and hides, which would remove the protection against lightly-taxed foreign productions, which would lead to the ruin of the tenant occupier, and the misery of the labourer."

Derby.—This town has been visited by the most serious flood ever remembered to have occurred here, caused by the overflow of the brook. The first intimation of danger was made by the watchmen, about one on Friday morning, the 1st inst., and immediate steps were taken to rescue property, but so sudden was the rush of waters, that considerable loss was sustained; and one young woman was drowned in her bed. Copings of the bridges, and the wall and railing of St. Warbeck's church, were washed away; and when the flood subsided, it was found that considerable damage had been done to goods, furniture, and almost every description of property throughout the town. The losses sustained in many instances have been of a serious description, amounting altogether to some thousands of pounds. The cause of the flood appears to be unknown, though by some it is supposed to have been produced by a water-spout, which burst on the neighbouring hills.

Newbury.—A large meeting, consisting, it is said, of nearly 400 of the principal agriculturists of Berkshire, has been held in this town to consider the measures of Government with respect to the trade in corn and provisions. Mr. W. Clarke, of Cookham, took the chair, and entered into a calculation of the injury the British farmer would sustain by the adoption of the Ministerial propositions. The collective loss of the producers on wheat, barley, meat, and spring corn would, he said, be not less than twenty-five millions, which would be a tax of 14*l.* 13*s.* 4*d.* per annum on farmers of 200*l.* a year. Such a charge was not to be endured, and he called upon them to agitate. Mr. Blackstone, the Conservative member for the neighbouring borough of Wallingford, addressed the meeting at great length, deprecating the proposed measures of Government as likely to injure seriously the agricultural interests in the country; and finally a resolution was adopted, expressing great anxiety and fear at the proposed change. It was also agreed that the meeting should send up petitions to both Houses of Parliament on the subject.

Salisbury.—We are informed by a local paper that it is in contemplation to pave the road from this city to Southampton with wood, after the patent of the Count de Lisle; and that Messrs. Sharp and Co., of Romney, have sent in an estimate for that purpose, which amounts to 95,000*l.*

Stockport.—An inquiry into the circumstances attending the outrage upon the inhabitants of this town, by a party of soldiers belonging to the 61st Foot, reported in our last, has taken place before the magistrates, and has terminated by the committal of eleven of the offenders on a charge of riot.

Windsor.—On Monday the ceremony of laying the New Military Church in this town was performed by H.R.H. Prince Albert. The weather was fine, and the company numerous, amounting, it is said, to upwards of five thousand persons. At ten o'clock the Royal Horse Guards and the 72d Highlanders marched on the ground, and were drawn up round the inclosed space set apart for the site of the new church in Clarence Crescent, where extensive arrangements had been made for the accommodation of the public; while the children of the various charity-schools, amounting to upwards of 900, formed in front of the visitors. At half-past ten a procession of the corporation, clergy, military, and gentry, moved from the Town-hall to the ground, and at eleven the bands struck up the National Anthem, which announced the arrival of the Prince. His Royal Highness was received by the Mayor, the Dean of Windsor, the Vicar, and the Provost and Head Master of Eton, and was conducted to the west end of the building, where the stone was laid with the usual ceremonies.

York.—A meeting has been held in this city, Lord Wharncliffe in the chair, for the purpose of receiving the report of the committee appointed for the restoration of the Minster. It appeared that the total receipts in subscriptions and from the sale of materials was 14,337*l.* 3*s.* 6*d.* The report was adopted; after which the Rev. C. Hawkins read a report on the fabric, which stated that the sum required to repair the dilapidations in the building not connected with the fire would be about 12,000*l.* The Rev. Mr. Harcourt then stated that the residentiaries were willing to give up part of their incomes arising from the church estates belonging to them; also to sell some of the church property, and borrow 10,000*l.* on interest for forty years; but this could not be accomplished without the sanction of an act of parliament. The sum required, it was stated, to complete the restoration of the parts injured by the fire was 9,000*l.*; 4,000*l.* of this sum the Dean and Chapter agreed to provide; and for the remaining 5,000*l.* they looked to the public.

Railways—A serious accident occurred on the line of the South Western Railway on Saturday, whereby four men lost their lives. It appears that several labourers were working in a shaft of the Waller's-Ash tunnel between the Andover-road and Winchester stations, when a portion of the shaft fell in, burying six men, four of whom were killed on the spot, and two others injured, but not seriously. An inquest has been held, when it appeared from the evidence that the quality of soil in the tunnel was such as induced the engineers at the time of its construction to depart from the usual practice of filling the shaft all up. On the Tuesday previous to the accident, appearances induced the engineers, Messrs. Locke and Brassy, to order the superincumbent weight to be removed from the arch at this point, and the work had been going on without intermission up to the time when the accident occurred. There had been occasional falls of chalk and bricks into the tunnel at this spot, which were not, however, considered by the Superintendents as indicating danger, and no change of importance was discovered in the shaft until about an hour or two before it fell, when one of the watchmen communicated his fears to the workmen above; but operations were not suspended.. The Coroner, after commenting on the evidence of the different witnesses, adverted to the fact that the men to whom the immediate superintendence of the work was entrusted were subordinate officers and illiterate persons, one of whom could not write his name, and the others were uneducated persons. He thought these were not the sort of men to be left in charge of works rendered necessary in consequence of an extraordinary change taking place in a dangerous part of the line. He believed that if the engineers themselves had been present, and had had their attention called to the fact that the falling brickwork had increased from two to six barrowfuls between four and six o'clock on the afternoon of Saturday, they would have ordered the men to cease working in the shaft. After some further observations, the jury returned a verdict of "Accidental death, deodand 50*l.*; and the jury consider that the foreman of the deceased men is not a fit and competent person to be entrusted with the lives of men in so important a work." Timely notice of the accident was given to the different trains, which were all stopped before entering the tunnel, the passengers being conveyed to and from the stations in post-chaises and other conveyances. The obstruction was again removed on Monday, since which time the trains have continued to run through the tunnel as usual.—On Monday another accident, which was fortunately not attended with serious consequences, occurred on this railway about two miles from Winchester, and near the entrance of the tunnel where the serious accident reported above happened on Saturday. It seems that one of the engines attached to a luggage-train from Southampton ran off the line, dragging with it the tender, which became so embedded in the earth that it was impossible to extricate it. Fears were entertained that the mail-train might arrive and run into the luggage-train, on account of the down-line at that spot being blocked up by the scaffolding which had been erected in the tunnel to prevent it from further falling in. After considerable exertions, however, the train was taken further up the line towards Winchester, and again placed on the proper line, when it proceeded to the Vauxhall station, where it did not arrive until two hours after its usual time.—A fatal accident has occurred,on the line of the Midland Counties Railway. It appears that a coal-train was proceeding at a slow pace towards Leicester, and when just past Syston, was overtaken and run into by a luggage-train drawn by two engines, and travelling at a speed of nearly twenty miles an hour. Many of the carriages were destroyed, others thrown off the line, and the tender of the coal-train engine fell upon the stoker, killing him on the spot. An inquest has been held, when a verdict of "Manslaughter" was returned against the drivers of the engines attached to the luggage-train, who were committed to take their trials.—A serious accident has also occurred on the Taff Vale Railway, near the Llandaff station, by which a guard of one of the trains was seriously injured, and about twenty passengers more or less hurt. It appears that the luggage and coal train down from Merthyr to Cardiff was later than its usual time, and on the up-passage train from Cardiff getting beyond the Llandaff station the two trains came into collision. The engineer jumped off and injured his leg, and the guard was thrown off and received a severe fracture of the skull. The passengers were thrown against each other with such violence as to break the partitions between the second-class carriages to pieces. Two of the coal carriages were broken to pieces, and the engines much injured.—On Thursday, a special general meeting of the proprietors of the West London Railway was held, to consider as to the method for carrying into effect the proposition of the directors for raising an additional capital of 47,000*l.*, for completing the railway from the Grand Junction Canal to the Kensington Canal Basin and other purposes, and also for taking the sense of the creditors on the proposal. The secretary stated the terms of the project, which were briefly to raise 15,000*l.* by debentures at five per cent. interest, and 32,000*l.* in new shares of 20*l.* each, to be issued to the public at 10*l.* each, making 47,000*l.* together. The money was to be appropriated as follows:—For paying the land creditors, 13,027*l.* 15*s.* 7*d.*; for completing a single line of railway, 32,000*l.*; to several small creditors, 659*l.* 6*s.* 9*d.*; and for contingencies, 1,312*l.* 17*s.* 8*d.*—together, 47,000*l.* Mr. Moser, a gentleman who attended on the part of the creditors, said the proposal was simply to offer the creditors ten shillings in the pound, and that on an uncertainty. A director said they were placed in a better position than the old shareholders, and that the proposal would be equal to twenty shillings in the pound ultimately, with perfect security for their money, provided the 32,000*l.* were raised. Mr. Moser said the creditors had not swerved from their former proposal. A proprietor said the claims for work and labour were not more than 10,000*l.* out of the 15,000*l.*, and 4,000*l.* was for legal proceedings and pay to the directors. The chairman saw no objection to substituting the proposal of the creditors, if they came forward to take a considerable portion of the new shares. Mr. Moser said Mr. Telfer had lost 2,500*l.* by his contract, and was now called upon to sacrifice half the remainder. He could not pledge himself to the creditors taking shares to a great extent. Mr. Whitchurch thought a further adjournment might lead to a compromise between the creditors and directors, and remarked, that if 200,000*l.* had been injudiciously spent through a wrong estimate, he did not see why 64,000*l.* could not now be laid out to as great advantage as on a railway within fifty miles of the Metropolis. After some further conversation, a resolution was passed unanimously, "That the meeting be adjourned, in order that the proposal of the directors and that of the creditors might be discussed between the parties; and that it be ascertained to what extent the creditors would subscribe for new shares; the result to be reported to a future meeting."—The amount of receipts of some of the principal railways during last week was as follows:—Brighton, 2,821*l.*; Blackwall, 736*l.*; York and North Midland, 1,669*l.*; Edinburgh and Glasgow, 1,628*l.*; Midland Counties, 2,316*l.*; North Midland, 3,725*l.*; Great North of England, 1,067*l.*; South Western, 5,075*l.*; Birmingham and Derby, 1,033*l.*; Great Western, 11,033*l.*; Northern and Eastern, 1,266*l.*; London and Birmingham, 14,112*l.*; Croydon, 320*l.*; Eastern Counties, 876*l.*; Manchester and Birmingham, 472*l.*; Birmingham and Gloucester, 1,547*l.*; Hull and Selby, 953*l.*

IRELAND.

Dublin.—On Friday, the 1st inst., the Lord Lieutenant and the Countess de Grey gave a state dinner to the heads of departments, at which a number of distinguished guests were present.—A meeting of the Repeal Association was held on Monday. A large green banner was fastened to the back of the chair, having inscribed in golden letters the word "Repeal," over which was placed a harp, surmounted by an Irish Crown: the whole appended to a long spear or pike, having "The Volunteers of 1782" carved on its handle. On another new banner, which hung from the wall of the room, appeared the inscription, "The people who desire not to legislate for themselves deserve slavery." On the arrival of the Lord Mayor, Mr. Ryan took the chair, when a letter was read from the secretary of a Repeal Association in the City of Lancaster, Pennsylvania, enclosing 311 dollars towards the Repeal rent. The Lord Mayor handed in the sum of 9*l.* 2*s*, the yearly subscriptions to the Repeal fund of several members of his family, including 22*s.* from 22 grandchildren. Mr. T. Steele said that he had lately attended a Repeal meeting in London, and that he intended setting out that evening to be present at another Repeal convention, to be held in Birmingham. He read a series of resolutions adopted at the London meeting, denouncing in violent language the means by which the Union was carried, and the persons who supported the measure. The Lord Mayor felt it necessary to explain that these resolutions were not proposed to be adopted by that meeting, but were merely the sentiments of the London Repealers. There were many phrases in them, he said, to which he objected and would wish to see moderated. He then presented 1*l.* from the Blessed Virgin Mary Tontine Society. A tradesman handed in two pewter medals, emblematic of the Repeal movement, and presented by the makers to Messrs. Ray and J. O'Connell, M.P., to be worn by them as inspectors of the Repeal wardens. The secretary next read a schedule of the receipts and expenditure of the Association, from the 1st Jan. 1841, to the 25th March, 1842. From this document it appeared that in these fifteen months the sum received was 9,993*l.* 8s. 9d., which was all expended with the exception of a balance of 218*l.* lodged in bank. It appeared that a sum of 2,000*l.* had been given to the Counties League Fund, for protecting tenants who voted against their landlords; 1,000*l.* was advanced for the expenses of the municipal revision in Dublin and elsewhere; 2,776*l.* was contributed for the advancement of the registering throughout the country; 546*l.* for the expenses of Repeal meetings; 650*l.* for printing and stationery; and the remainder in various small items, including 375*l.* as salary to the secretary. The Lord Mayor then delivered the usual address to the meeting, but it presented no new topics of interest.—Some sensation was created in this city on Tuesday, by the announcement that Sir Ross Mahon had been found dead in his bed. The deceased baronet, who was a captain in the 60th Rifles and an extra Aide-de-camp to the Lord-Lieutenant, formed one of the vice-regal dinner party at the Castle on the previous evening, and left for his own apartments, in company with Lord J. Butler, at an advanced hour of the night, apparently in good health and spirits. The following morning, however, on his servant entering the bed-room for the purpose of calling him up, he discovered that his master was a corpse.—The Dublin and Kingstown Railway Company had the proposition for the application of Clegg and Samuda's Atmospheric Railway to the extension of the line for two miles towards Dalkey, before a general meeting on Tuesday, when it was affirmed by a large majority. The works, it is said, will be commenced with as little delay as possible.

Queen's County.—The local papers announce the stoppage of one of the largest manufacturing houses in Ireland, the firm of Joseph Beale and Co., of Mountmelleck, in this county. The same journals state, that although it is understood that the assets, if the cost of the extensive machinery and buildings be taken into consideration, considerably exceed the liabilities, it is feared that the effects of the shock cannot speedily be recovered. It is also said that 1,000 persons are thrown out of employment by the stoppage.

SCOTLAND.

Edinburgh.—On Friday night, the 1st inst., a riot, which at one time threatened to be serious, took place in the Grassmarket. It seems that a quarrel arose between some soldiers of the 53d Reg, who were in a public-house in the Grassmarket, and some Irishmen who were Catholics. The landlord put the civilians out of the house; and the soldiers following a few minutes afterwards, found the Irishmen reinforced with friends waiting at the door to assault them. A riot commenced—the soldiers endeavouring to get to the Castle by the West Bow, which they succeeded in reaching; but when near Victoria-street, they made a stand, and pelted their assailants with stones. At this time a picket from the Castle and a party of police interfered, and separated the combatants. It is stated that the matter is under investigation by the authorities.—It is announced by a local paper that Lord Belhaven will soon cease to represent her Majesty in the meetings of the General Assembly, and that either Lord Arbuthnot or Lord Strathallan will be the new Lord High Commissioner.

Greenock.—The Renfrewshire Bank, which had its head office in this town, has stopped payment, and the failure has produced considerable excitement in this town and neighbourhood. It seems that there were only three partners in the bank, who were collectively indebted to the company 40,000*l.* The liabilities of the concern are stated at 200,000*l.*, and it is said that the Bank is not likely to pay more than 2s. in the pound. Their notes, on the first report of the stoppage, were sold at 15s., but gradually fell to 2s. 6d. A severe run has also been made upon the Greenock Savings' Bank; but the managers were prepared to meet it. The other banks in the town also promptly met the run upon them.—On Monday a public meeting was held to consider what steps it might be desirable to take for relieving the necessities of the number of unemployed operatives in this place. From a survey made by a committee of operatives, it seems that 913 heads of families, having dependent upon them 2,080 individuals, were found to be destitute of employment; but as the survey appears to have been imperfect, it was computed that the heads of families out of work amounted nearly to 2,000. A committee was appointed, which was subdivided into district committees, to receive applications for relief, one of the proposed modes for providing which was to seek out work for the unemployed.

Perth.—It is stated in the Dutch papers that there was picked up a few days ago, on the shore near Wyk, a bottle containing two letters not sealed, and written on the 2d March, by Capt. Thomason, of the ship Blair Adam. The captain in these two letters informs his relations in this town that his crew had threatened during the day to murder him and to throw him overboard.

THEATRICALS.

Covent Garden.—On Thursday Miss Adelaide Kemble made her appearance in a new character at this theatre, as *Amina* in Bellini's opera of *Sonnambula*. Her personation of this character was as successful as those in which she has already appeared in *Norma* and *Elena Uberti*. Her performance elicited frequent applause, and at the fall of the curtain she was loudly called for to receive the congratulations of a crowded audience. The opera throughout was well sustained; the principal performers, in addition to Miss Kemble, being Miss Grant, Mrs. R. Hughes, Messrs. Leffler, Harrison, G. Horncastle, and Wigan; Mr. Leffler appearing as *Count Rudolpho*, and Mr. Harrison as *Elvino*.

Miscellaneous.

Niger Expedition.—Letters have been received from Ascension, dated Feb. 7th, stating that the Albert had arrived there on the 28th January. No deaths had occurred in the interim. It is added that the Wilberforce was in better condition than when she left England, and that it was Capt. Allen's intention to take her and the Soudan to the coast in March, from whence he proposed re-ascending the river, which it was expected he would be able to do in April.

The New Testament.—Private letters from Rome inform us that Cardinal Angelo Mai has just completed a work on which he has been occupied for upwards of ten years; being an edition of the New Testament, with the variations of all the manuscripts existing in the principal libraries of Rome and other parts of Italy, and with numerous notes full of philological research. The text adopted by Cardinal Mai, as the basis of his edition, is that of the celebrated manuscript, No. 1,209, in the library of the Vatican, which dates from the sixth century. At the suggestion of his Eminence, the Papal Government has resolved to publish, at its own expense, a fac-simile of this manuscript, which is in gilt uncial letters and in close writing (*scriptis continuis*), that is to say, the words are not separated from each other by spaces. The celebrated engraver Ruspi is to execute a copperplate engraving of this fac-simile, copies of which will be presented by the Holy See to all the Sovereigns in Christendom.—*Times.*

Bank of England.—The quarterly average of the weekly liabilities and assets of the Bank of England for the twelve weeks ending the 29th ult., shows that the circulation has increased by 183,000*l.*, the difference between 16,952,000*l.* and 16,796,000*l.*; the deposits have decreased by 297,000*l.*, the difference between 8,657,000*l.* and 8,954,000*l.*; the securities have decreased by 513,000*l.*, the difference between 22,586,000*l.* and 23,099,000*l.*; and the bullion has increased by 438,000*l*., the difference between 6,125,000*l*. and 5,687,000*l*.

The Disasters in Affghanistan.—The "Englishman" Calcutta paper of Feb. 4th contains the following letter from Dr. Brydon, the only European of the Cabul army who succeeded in reaching Jellalabad, which will be read with great interest. The letter is addressed to his brother, and is dated Jellalabad, Jan. 20th: "Here I am at this place, all safe, but not all sound, having received three wounds, on the head, left hand, and knee. I have lost everything I had in the world; but my life has been saved in a most wonderful manner, and I am the only European who has escaped from the Cabul army (although we have heard of two having been taken by the enemy, it is very doubtful if they will be spared). Two natives only have reached this place—making, with myself, three persons out of an army of 13,000. I got on very well till within about 50 miles of this, with the exception of losing all my baggage, &c. I then lost the horse on which I was riding; having taken one of my servants, who was wounded, up behind me, we fell rather too far in the rear, when he was pulled off behind, and I fell with him. I was instantly felled to the earth with the blow of a large knife, which wounded me in the head. I, however, managed to avert the second blow, by receiving my enemy's hand on the edge of my sword, by which his hand was somewhat damaged, and he dropped his knife, and made off as fast as he could; and I, following his good example, managed to reach the main body, minus my horse, cap, and shoe, which last I lost in the snow. I was then trudging along, holding fast by the tail of another officer's horse, when a native, who was riding close by, said that he could ride no further, and told me to take his horse, which I did without delay. I do not know who the man was, as it was quite dark at the time, but the saddle must have belonged to an Affghan. I now got to the front, where I found a number of officers, who determined to push on, as the men would obey no orders, and were halting every minute. We travelled on slowly all night, fired at occasionally from the sides of the hills, and found ourselves at daybreak about 30 miles from this, our party consisting of only seven officers, five European soldiers, and myself, the rest having lost us in the dark, and gone by some other road. At about 10 A. M. we were attacked and surrounded on all sides by horsemen; three officers and the five Europeans were here killed—one of the officers was Lieut. Bird, of the Madras army, who fell close by my side. I, with the remaining four, got clear of the horsemen, and pushed on; three of our party being well mounted, left the fourth and myself far in the rear, when he, after coming on some way, said his horse was done up, and that he would hide until night; for which purpose he left me about four miles from this. He was taken and killed. I proceeded slowly for a short time, when I saw a great many people running towards me in all directions. I waited until they got pretty close, and then pushed my horse into a gallop and ran the gauntlet for about two miles under a shower of large stones, sticks, and a few shots, in which I had my sword broken by a stone, my horse shot in the spine close to the tail, and my body bruised all over by the stones. I was now attacked by a horseman, who left a party of about six, whom I saw leading away one of our officers' horses who had gone on ahead: these three were killed; and having nothing to defend myself with, and my horse being quite done up, he wounded me on the knee and hand, when seeing me stoop down he galloped away as fast as he could, thinking, I suppose, that I was looking for a pistol. I now proceeded unmolested, and arrived here about one o'clock, quite done up, as was also my poor horse, who lost the use of his hind legs next day, and died two days after, without ever getting up after his arrival. If you receive this, let them know at home that I am alive, as I have not been able to write since October last, and perhaps we shall not have the road open when the next overland starts. Since arriving here I have had three shirts, three pair of socks, a jacket, and a pair of trousers given me. A very fine stock, you will say; however, it must do until I can get another outfit. Write to me, and let me know the news from home. Your affectionate brother, WILLIAM BRYDON. P.S. I arrived here about noon on the 13th. All further particulars you will find in the papers, so I can write no more at present, it being awkward holding my paper whilst writing."

Law.

HOME CIRCUIT.—*Napper v. Hole, in re the West Middlesex Insurance Company.*—This was an action brought by plaintiff against defendant, as the originator and principal in the establishment of the West Middlesex Assurance Association, to recover from him the sum of 900*l*., which she had paid to that company for an annuity of 76*l*. 10*s*., and of which sum, it was alleged, she had been defrauded by defendant; and also that the association had merely been got up for the purposes of fraud. Evidence was adduced at considerable length exposing the system of fraud practised by this association, for the purpose of imposing on the public. Witnesses, who had been the nominal directors of the company, stated that they had been hired, some for five, some for ten shillings a week, to personate directors, and attend meetings on given days for the purpose of signing whatever policies were placed before them by the defendant. One of the witnesses stated that he was previously a journeyman blacksmith, and another that he was an usher in a school; that they received written instructions how they were to conduct themselves on such occasions; that they were to dress respectably and wear rings and jewellery; and that they were subject to be fined whenever they failed in any of these particulars: that their own names and those of others of a similar description were the only real names in the list of directors, all the others printed being fictitious. After much evidence of a similar character, and proof had been adduced that the moneys paid to the association had been received by the defendant, who was secretary and managing director, the jury found for the plaintiff—Damages 900*l*. A number of similar cases were then tried by other parties against the defendant on the same grounds, for different sums amounting altogether to upwards of 4,500*l*. The jury in each case found for the plaintiff, and the verdicts having been recorded in all the cases, an application was made for speedy execution, which Baron Gurney granted.

NORTHERN CIRCUIT.—*Robert Woods, Isaac Jacques,* and *Thomas Molyneux* were indicted for the wilful murder of Henry Grayson, at Windle. The circumstances attending the murder, which took place on the 4th Dec., were given in this Paper at the time. The principal evidence against the prisoners was that of a man named Colquitt, who deposed to having been in the company of the prisoners on the evening of the day the murder was committed, and related a conversation which took place between him and them, from which he concluded they had murdered Mr. Grayson. The evidence, however, was contradictory, and not being supported, the jury acquitted the prisoners.

MARK LANE, FRIDAY, APRIL 4.—We had a very indifferent attendance at market this morning, and no fresh supply of English Wheat; the trade was exceedingly flat at Monday's prices. Of free foreign there was but little sold, and Monday's advance could not be maintained. There was some inquiry for bonded, without much business being done, the purchasers not liking to pay the rates demanded.—Barley is unaltered in value; and Peas and Beans are rather improving.—Irish Oats are very unsaleable; English sell on the same terms.—The trade in Clover Seed is drawing to a close, and is very dull to day at Monday's prices.

BRITISH, PER IMPERIAL QUARTER.			s. s.		s. s.

TATTERSALL'S, THURSDAY.—Without any exception worthy of notice, the betting was confined to the Derby horses, three of whom were backed with uncommon spirit, viz., Eleus, the Frederica colt, and the Devil among the Tailors; the first being in John Day's stable. Eleus opened at 30 to 1, and after a great number of bets at those and less odds, reached 1000 to 60 (taken repeatedly). The Frederica party then came into play, and put on a large stake at 2000 to 40, 2000 to 35, and 2000 to 45; the last odds taken were 50 to 1. This movement operated as a check upon the Eleus division, and at the close the thousands to sixty went begging. The Devil-among-the-Tailors was backed to win nearly 20,000*l*., at thousands to ten, fifteen, twenty, &c.; but nothing was heard of Brother to Cantle. Of the standard favourites, there was an improvement in Attila and Chatham, 7 to 1 having been taken about the first to 300*l*. (besides other bets at 7 and a fraction), and 15 to 1 against the other to about the same amount. Auckland and the Joanna colt were also in request, and left off steady, at the prices mentioned below. It was otherwise with Meteor, the Lord of Holderness, and Wiseacre. Liberal odds were obtained in several quarters about Belcœur, Barrier, and Defier. The only Oaks bet was 30 to 1 agst Mr. F. Wood's Eliza; and in the 2000 Guineas Stakes and Chester Cup nothing was done. The last prices were as follow:—

100 SOV. SWEEPSTAKES AT NEWMARKET.

40 to 10 on Attila agst The Devil-among-the-Tailors (taken) not p.p.

DERBY.

7 to 1 agst Attila (taken)
15 1 Chatham (taken)
100 6 Eleus
18 1 Auckland
25 1 Joanna colt (taken)
20 1 Moss Trooper (tak. and afterwards offered)
33 1 The Lord of Holderness
35 1 Meteor
40 1 Espartero
40 1 Wiseacre
45 1 Acacia colt
50 1 Policy (ta. and aft. off.)

50 to 1 agst The Devil-among-the-Tailors (taken)
2000 35 Defier (taken)
2000 35 Belcœur (taken)
66 1 Defier (ta. and aft. off.)
13 1 Eleus & Frederica (ta.)
7 1 Scott's lot, bar Attila (taken)
1500 even between The Devil-among-the-Tailors and Barrier (tak.)
1000 even between Chatham and Eleus (taken)

OAKS.

30 to 1 agst Mr. F. Wood's Eliza (taken)

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

LIEBIG'S AGRICULTURAL CHEMISTRY—SECOND EDITION.
In small 8vo., with numerous additions, including a NEW CHAPTER ON SOILS, price 9*s*. 6*d*.

CHEMISTRY in its Application to AGRICULTURE and PHYSIOLOGY. By JUSTUS LIEBIG, M.D., Professor of Chemistry in the University of Giessen. Edited from the Manuscript of the Author by LYON PLAYFAIR, Ph. D. "In the present Work Dr. Liebig has pointed out the path to be pursued, and has amply vindicated the claim of Science to be considered the best guide, by correcting the erroneous views hitherto prevailing, of the sources whence plants derive their nourishment, by developing the true causes of fertility in soils, and finally by establishing on a firm basis the true doctrine of Manures."—*Quarterly Review,* March 1842.—Printed for Taylor and Walton, 28, Upper Gower Street.

AMUSEMENTS OF COUNTRY LIFE.
In 8vo, illustrated with nearly 600 beautifully-executed Engravings on Wood, 50*s*. cloth lettered,

AN ENCYCLOPÆDIA OF RURAL SPORTS.
By D. P. BLAINE, Esq.

"A perfect library for all lovers of country sports, for all country gentlemen, and for all persons who delight in the manly and healthy recreations which are afforded to the inhabitants of no country in such perfection as to the inhabitants of the British Isles."—*Times.*

London: Longman, Brown, Green, and Longmans.

LINDLEY'S ELEMENTS OF BOTANY.
Illustrated by many hundred Figures on Wood. In 1 Vol., 8vo, price 10*s*. 6*d*.,

ELEMENTS OF BOTANY, STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, and MEDICAL. Being a Fourth Edition of the First Principles of Botany. By JOHN LINDLEY, Ph.D., F.R.S., Professor of Botany in University College, London.

"The skill of the wood-engraver has enabled the author to fill his pages with Illustrations, explanatory not only of the technical terms employed in Botany, but also of the natural orders of plants. An analysis of the latter upon the plan of Lamarck; an account of De Candolle's celebrated system of arrangement, into which a large number of woodcuts are introduced, and some new views, relating to natural classification, are added to the matter to be found in previous editions."—*Preface.*

Printed for Taylor and Walton, 28, Upper Gower-street.

Now publishing, in Weekly Numbers, at 6*d*.
MR. MURRAY'S CHEAP AND POPULAR EDITION OF

LORD BYRON'S TALES.

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—The FIRST FLOWER SHOW of the above Society for the year 1842, will be held at the HORNS TAVERN, KENNINGTON, on WEDNESDAY NEXT, the 20th April, 1842.—A Band of Wind Instruments will attend.—Open from One till Seven. Admission One Shilling. R. H. CUMING, Hon. Sec.

FLORICULTURAL SOCIETY OF LONDON.—The AURICULA SHOW will take place on Tuesday, the 26th inst. For Lists of Prizes and other particulars, see the advertisements already issued. Notice to be given to the Secretary on or before Monday, the 25th. After the judgment all Seedlings will be required to be named, whether successful or otherwise; and any proper information with regard to them that may be required. J. C. WILDMAN, Hon. Sec.

Crown and Anchor Tavern, Strand, 14th April, 1840.

CARNATIONS and PICOTEES.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL can supply the above Flowers at the following prices. Their collection is the most extensive and select in the kingdom, and for strength and healthiness are unrivalled. They beg to state that none but first-rate show flowers will be sent out.

12 pairs of fine Show Flowers, by name		£1 10*s.* 0*d.*
25 do.	do. do.	3 0 0
12 do.	extra fine do.	2 10 0

Amongst which will be included a pair of that splendid Red Picotee ANACREON.—Great Yarmouth Nursery.

MYATT'S BRITISH QUEEN STRAWBERRY.

J. and W. MYATT beg to return their sincere thanks for the very liberal patronage they have received from the Nobility and Gentry, and to inform those who have not yet favoured them with their orders, that the approaching season is most desirable for planting; they can supply plants of the British Queen and Eliza Strawberry, the former at 5*l.*, the latter at 1*l.* per 100.

The unpropitious state of the weather for late autumn-planting induces them to inform those who have been purchasers, that they will be happy to reinstate any that have not succeeded, by direct application to the parties who have supplied them, such application to be limited to April. Plants carefully packed and forwarded to any part of England.

Manor Farm, Deptford, March 31, 1842.

J. KERNAN begs to inform Noblemen and Gentlemen wishing to improve the appearance of their Shrubberies, that he will forward, per post, a Mixture, including the 24 kinds of Flower Seeds recommended in the Leading Article of last week's *Gardeners' Chronicle*, for 3s, and an equally suitable Mixture of an equal number, where the Shrubberies are extensive, and more diversity required, for 3*s*. Also 25 separate papers of the more modern and showy hardy Annuals, sent per post, for 5*s.* 6*d.*; the end of April and beginning of May will be found the best time for sowing: one Plant raised in the open border will make more show than six raised on heat and transplanted.

Seeds carefully selected and packed for all climates.

4, Great Russell Street, Covent Garden.

THOMAS CRIPPS, FLORIST, TUNBRIDGE-WELLS, respectfully informs his Friends that Plants of the New White Fuchsia "VENUS VICTRIX" will be ready the first week in May, at 21*s.* each, with the usual discount to the Trade, if three or more Plants are taken at once. For particulars see Floricultural Cabinet for March, or Gardeners' Gazette or *Chronicle* of 5th inst. Orders for this will be received by Mr. George Charlwood, 14, Tavistock-row, Covent-garden; Messrs. Cormack and Co. New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood & Son, Maresfield Nursery; or addressed as above.

PLYMOUTH NURSERY.

ALEXANDER PONTEY begs to call the attention of the Public to his Stock of Hothouse, Greenhouse, and other PLANTS, especially to his new FUCHSIA TRICOLOR, a beautiful delicate blush white, with sepals tipped with green; a free grower and bloomer; plants of which are now being sent out at 10*s.* 6*d.* each. Also the following PELARGONIUMS:—

Lyne's Countess of Mount Edgcumbe	21*s.* 0*d.*	each.
— Diadem, a large white	21 0	—
— Peri of the West	10 6	—

The sorts named under at 60*s.* per dozen:—Amethyst, Beauty, Bridesmaid, Corona, King John, Wildfire, Inez de Castro, Nymph, Lady Douro, Prince Albert, Vulcan, Comte de Paris, Sultan, Pince's Zenobia, Jupiter, Matilda, Lifeguardsman, Apex, Wonder, Pride of the Hill. Other good sorts at from 9*s.*, 12*s.*, to 18*s* per dozen.—Plymouth Nursery, April 4th, 1842.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.—WILLIAM WOOD & SON beg leave to draw the attention of Amateurs to a splendid New Seedling PETUNIA, Fielder's Magna rosea, price 3*s.* 6*d.* each; also two magnificent Seedling GERANIUMS, raised by C. W. Fox, Esq., of Truro, viz., the Princess Royal, 21*s.* each, and the Duke of Cornwall, 21*s.* each, ready for delivery early in May. For description see *Gardeners' Chronicle* of 9th April.

Plants of the above may be had at the Nursery, Maresfield; in London of Messrs. Warner and Warner, 28, Cornhill; Mr. J. Carter, 238, High Holborn; and at Tunbridge Wells of Mr. T. Cripps, Nursery. Usual discount to the Trade if three or more of the above are taken at once.

W. C. DRUMMOND begs to offer the following four SEEDLING DAHLIAS:—Europe (Drummond's) White buffed and good show flowers, 3 feet, 10s. 6d.; Asia (Do.) Maroon, striped with black, a fine show flower, 2d prize at Bath open show, 1841, 4 feet, 10s. 6d.; Africa (Do.) Copper-colour, mahogany tip, very constant and good, show flower, 3 feet, 10s. 6d.; America (Do.), Rosy crimson, decided improvement on Le Grand Baudin, was shown in 7 winning stands, 3 to 4 feet, 10s. 6d.; all warranted first-rate. W. C. D. engages to deduct from account any of the above varieties not bearing out the representation given. A catalogue may be had on application, Weston-road Nursery, Butts, A., 1842.

NEW AND SUPERIOR PANSIES.

J. HENCHMAN begs to call the attention of PANSY-GROWERS to the five varieties of this favourite Flower, which he is now sending out at the following moderate prices:—

12 Superior Seedlings, 42*s.*
12 Superior Prize Flowers, selected from the best of last year's varieties by various growers, 21*s.*
12 very Excellent Show Flowers, 15*s.*
25 Good named Show Flowers, 1*l.*

A few Packets of Seed, at 2*s.* 6*d.* and 5*s.*

Edmonton, near London, April 16th, 1842.

BELMONT NURSERY, STOKE, NEAR DEVONPORT.

JESSE ADAMS having purchased the entire stock of SEEDLING GERANIUMS raised by Charles Thurtell, Esq., begs to acquaint the Public that he has now a large stock of well rooted, healthy Plants ready for delivery. They comprise the following 24 varieties, viz.: Thurtell's—Britannia, Radical, Wonder of the West, Ne Plus Ultra, Surprise, Warrior, Masterpiece, Ultra Flora, Queen, Queen Consort, Queen Dowager, Ann, Armada, Lady Minto, Eclipse, Admiral, Collingwood, Nelson, Revenge, Bride, Elegans, Exquisite, Sir Graham Moore, Reform. J. A. has also the entire stock of another seedling Geranium raised by a different party, consisting of three plants only, two of which are for sale at 45s. each. This beautiful variety possesses all the qualities of a first-rate flower, and which J. A. proposes to name the "Beauty of Belmont;" never before advertised.

With respect to Mr. Thurtell's flowers, all of which are allowedly excellent, it is difficult to make a selection; but the four first named on the list are admitted to be splendid first-rate flowers; and of these, "Wonder of the West" is by competent judges said to be the finest Geranium ever blown. These four varieties will be sent out at two guineas each.

A very large variety of other healthy, well-rooted plants, on moderate terms.—Stoke, near Devonport, April 12th, 1842.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, DAHLIAS, FUCHSIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers is now ready for delivery, including Fuchsia, Conspicua arborea, raised by S. R. Prouse, Esq.; it is of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out an expanded bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Plants in May at 10*s.* 6*d.* Also two new and distinct varieties of the Verbena, from Texas—Ne Plus Ultra, a clear bright pink, with a rose-coloured spot surrounding the tube, which is white; a pleasing variety; colours very much resemble those of Phlox Drummondii: Elegans, a pale pink, with a delicate rose-coloured spot surrounding the tube; plants in May, the two, at 10*s.* 6*d.* Likewise Dahlia, Lady Ann Murray, a beautiful mottled white tipped with bright rosy purple, a well-formed flower, with a fine centre, one of the most constant Dahlias grown, and desirable to the most limited grower, 3 feet, 10*s.* 6*d.*

Hans-street, Sloane-street, Chelsea.

SALTHILL NURSERY, near WINDSOR.—A. J. STEWART respectfully informs the Nobility, Gentry, and the Public, that his descriptive Catalogue of new and choice Geraniums, Camellias, Fuchsias, Verbenas, Dahlias, Pansies, Calceolarias, Roses, miscellaneous Greenhouse Plants, Picotees, &c. &c., may be obtained by a prepaid application as above, and enclosing two postage stamps.

A. J. S. embraces this opportunity to apprise the cultivators of CAMELLIAS that he can furnish a few more assortments as offered by him on the 12th February in the *Gardeners' Chronicle*, excepting that Tricolor or King will be substituted for Lady Henrietta.

Good plants of Hardenbergia macrophylla, at 7s. 6d.

NEW AND SUPERB FUCHSIAS.

THE Nobility, Gentry, and Florists, are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias now ready to be sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s.* per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

OILS, COLOURS, VARNISHES, &c.—Best Ground White Lead, 30s. per cwt.; 2nd, 28s.; 3rd, 24s. Linseed Oil, 3s. per Gallon; Turps, 4s. 9d.; Dry or Ground Brunswick Green, from 4½d. to 1s. per lb.; Invisible Green, for Rough Work, 30s. per cwt.; Stone colour, 34s.; Celestial Blue, 6d. per lb.; Quick-drying Carriage Varnish, 14s. per gallon; French Polish and Spirit Varnishes, 20s.; Naphtha do., 11s. 6d.; Burning Naphtha without smell, 6s. 6d. per gallon; Best Stockholm Tar, 21s. per barrel; Coal do., 10s. 6d. do.

Every description of Colour Brushes, &c., of the best quality, at the lowest prices for cash, at Nixey's, 22, Moor-street, Soho.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

LITERARY FUND, for the PROTECTION and RELIEF of AUTHORS of Genius and Learning and their Families, who may be in Want or Distress. Instituted 1790. Incorporated by Royal Charter, 1818.

Patron—Her Most Gracious Majesty THE QUEEN.
President—The Marquis of LANSDOWNE.

The ANNIVERSARY DINNER of this Corporation will take place in Freemasons' Hall, on WEDNESDAY, MAY 11.

His Royal Highness PRINCE ALBERT in the Chair.

The List of Stewards will be Advertised in a few days.

OCTAVIAN BLEWITT, Sec.

73, Great Russell-street, April 14.

THE DIRECTORS OF THE NEW ZEALAND COMPANY hereby give notice, that despatches having been received from Captain Arthur Wakefield, R.N., reporting that the NELSON SETTLEMENT has been successfully planted on the south-eastern coast of Tasman's Gulf, Cook's Straits, New Zealand, preliminary ALLOTMENTS of LAND in the said settlement are now ON SALE to intending colonists and others. The district is described as containing an abundance of good fertile land, available at once for agriculture and pasture, the country being less thickly wooded than in other parts of New Zealand. The haven of Nelson forms a natural basin, in which ships may be in good shelter close to the shore.—Applications from intending colonists, and from persons of the labouring class desiring a free passage, are received daily at the Company's House, where full information may be obtained on application to the Secretary.

New Zealand House, By order of the Court,
Broad-street-buildings, March 24, 1842. JOHN WARD, Sec.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

PRODUCTIVE LIFE ASSURANCE SOCIETY and MARITIME FUND empowered by Acts of Parliament. Offices, 29, Moorgate-street, Bank, London.

Board of Directors.

John Blogg, Esq., Guildford-st., Russell-square.
Donald Grassick, Esq., Bedford-place, Kent-road.
Hyam Hyams, Esq., Cornhill.
George Rose Innes, Esq., Billiter-street, City.
J. Linnit, Esq., Argyll-street, Regent-street.
W. T. Smith, Esq., Public Office, Southampton-buildings.

(With power to add to their number.)

Treasurer.—Hyam Hyams, Esq.

Auditors.

Robert Dover, Esq., Cornhill.
Amos Hodgson, Esq., Ordnance Office, Tower.
James Walton, Esq., Grocers' Hall.

Arbitrators.

Charles Compton, Esq.
Peter Ellis, Esq.
John Tidd Pratt, Esq.

Bankers.—The Bank of England.
Physician.—William Brewer, M.D., F.R.S., &c., 21, George-street, Hanover-square.
Surgeon.—David Lewis, Esq., 28, Artillery-place West, Finsbury.
Solicitors.—Messrs. Chatfield, Wingate and Hart, Cornhill.
Actuary.—Francis G. P. Neison, Esq.
Chief Agent for the Maritime Fund.—Thomas Bull, Esq., 91, Minories, London.

This Society is established on the principles of Mutual Life Assurance, with a division of the whole amount of profits among all the assurers, to whom the books of the Society always lie open for inspection. A General Meeting takes place annually, at which is given a detailed account of the business of the Society. No policy stamp duty charged on assurances above the term of ten years.

The Maritime Fund is a department of the Society which affords to captains and mariners the same facilities and advantages of life assurance which residents in England have hitherto enjoyed. Upon this fund, at a comparatively small cost, a member (should he be lost at sea on a particular voyage) will provide an annuity for his wife as long as she lives, in proportion to what he has paid.

Every particular may be known, and Prospectuses and "Observations upon the Maritime Fund" obtained, by applying to Mr. Bull, any of the country agents, or the Secretary, at the offices, 29, Moorgate-street. GEORGE B. SCOTT, Secretary.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES—Green, 1*s.* per lb.; White, 1*s.* 2*d.* per lb.; or from 2*s.* 6*d.* to 24*s.* per dozen. Cucumber Tubes, all lengths, from 6*d.* to 4*s.* each. Grape Shades, from 2*s.* 6*d.* each. Irish Globes, from 1*s.* 6*d.* each; ditto for Fountains, with solid bottom and hole, 2*s.* 6*d.* per lb.—APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars, where every description of Table Glass China is on show. Days for viewing the Works—Tuesday, Wednesday, and Thursday.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, Borough.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS.

The Committee of the Benevolent Institution have the pleasure of adding the following list of new Subscribers to those published in February last, viz:—

	£.	s.	d.
Brampton, John, Esq., Albion-road, Stoke Newington	1	1	0
Cleave, —, gardener to the Hon. George Fortescue, Bocannock, Lostwithiel, Cornwall	1	1	0
Coates, —, gardener to — Hibbert, Esq., Denmark-hill	1	1	0
Donoughue, —, Heachum, near Lynn, Norfolk	1	1	0
Edwards, Mrs., Carshalton-grove	1	1	0
Everest, Jas., at Mr. Waterer's nursery, Bagshot	1	1	0
Godfrey, Robt., at Mr. Waterer's, Knapp-hill	1	1	0
Flanagan and Co., seedsmen, Mansion-house-street	1	1	0
Hirst, Evan, at S. Hole's, Caunton Manor, near Newark	1	1	0

Young, J. F., Esq., Kennington-lane	1	1	0

J. J. Bowler, Hon. Sec.

⁂ The Committee beg leave most respectfully to remind the Subscribers whose subscriptions are unpaid, that by the Rules of the Institution, no person can vote at the ensuing election on the 2d of June next, unless the subscription be paid before that day. And that the Rules, &c, with a full and corrected list of the Subscribers, state of the Funds, &c, may be obtained on application to the Secretary, to whom all post-office orders are requested to be sent, payable at the General Post-office, St. Martin's-le-Grand; and that, as the Secretary is exerting himself to save as much as possible the expense of collection, the Committee trust that Subscribers will kindly assist by transmitting their subscription at their earliest convenience.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

Game and Cattle Fencing in variety.

THE CONICAL HOT-WATER BOILERS invented by J. Rogers, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. Shewen having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

SALE POSTPONED.—CHOICE SHRUBS, &c.—Mr. Lahee respectfully notifies that this Sale is postponed to WEDNESDAY, the 20th inst.

TO BE DISPOSED OF.—A NURSERY, SEED, and FLORIST BUSINESS, situated at Henley-on-Thames, Oxon. For further Particulars apply to Messrs. W. & J. Noble, Seedsmen, 152, Fleet-street, London; or to the Proprietors on the Premises.

THE VALUABLE BOTANICAL LIBRARY OF THE LATE A. B. LAMBERT, ESQ.

MR. SLEIGH SOTHEBY will sell by AUCTION, on the Premises, 26, Lower Grosvenor-street, on Monday, April 18, and two following days, the fine and valuable BOTANICAL LIBRARY of the late A. B. Lambert, Esq., F.R.S., F.S.A., &c., of Boyston House, Wilts, Author of the "Genus Pinus," and "Genus Chincona." The Collection will be on public view, on the Friday and Saturday preceding the sale.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public Competition at the Mart, Bartholomew Lane, on THURSDAY, APRIL 21st, 1842, at Twelve o'Clock, a splendid collection of CARNATIONS and PICOTEES, the Surplus Stock of a much-esteemed Amateur. Also a fine assortment of DAHLIAS, GERANIUMS, and other Plants in bloom. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

MR. T. ANSELL, Jun., is instructed to SELL by AUCTION, at the Auction Mart, Bartholomew Lane, on TUESDAY, 19th inst., an Extensive Collection of DAHLIAS (in about 150 choice varieties), in Pot-Roots, well adapted for Exportation. Likewise several new and choice Varieties in Plants: a Miscellaneous Assortment of GREENHOUSE PLANTS in bloom. Also a Collection of New Fuchsias, Monypenii, Humboltii, &c.; and a variety of Plants suitable for turning out in the flower-borders. May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneers, Camden Nursery, Camden Town.

FOR THE FACE AND SKIN.

ROWLAND'S KALYDOR, a preparation from Oriental Exotics, is now universally known as the only safe and efficient protector and beautifier of the Skin and Complexion. Its virtues are commonly displayed in thoroughly eradicating all Pimples, Spots, Redness, Tan, Freckles, and other unsightly Cutaneous defects, and in rendering the most rough and uneven skin pleasantly soft and smooth. To the complexion it imparts a juvenile roseate hue, and to the Neck, Hand, and Arm, a delicacy and fairness unrivalled.

It is invaluable as a renovating and refreshing Wash, during travelling, or exposure to the sun, dust, or harsh winds, and the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving.

Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

Caution.—Ask for "Rowland's Kalydor," and see that these words are on the envelope, with their signature and address in *red*, "A ROWLAND and SON, 20, Hatton Garden, London;" the same are engraven on the Government Stamp affixed over the cork. Sold by them, and by respectable Perfumers and Medicine Venders.

WANTS a Situation as GARDENER in a Nobleman or Gentleman's Family, a Married Man, of sober and industrious habits, who has a thorough knowledge of his business. Can have an unexceptionable character from the family he has just left. No single-handed place will be accepted. Direct to H.M., Mountjoy and Son's, Nurserymen, Ealing, Middlesex.

WANTS a SITUATION as GARDENER, a Single Man aged 27, who from infancy has been employed in Situations in various parts of England, where every branch of Gardening is carried on very extensively; with an unexceptionable character from his last situation.—Address, A. B., at Mr. Whitehorn's, Horticultural-place, Turnham Green. Wages, 70*l*.

WANTS a SITUATION as GARDENER, a respectable Married Man, with no incumbrance, aged 36, and has a practical knowledge of his business; can have an excellent character of three years from the gentleman he has just left. Wife would not object to the care of a Lodge, if required.—Direct, C. S., Mr. Gardener's, Greengrocer, &c., Upper Tooting, Surrey.

WANTS a SITUATION as GARDENER, a Married Man, aged 30, with One Child; who understands the culture of Pines, and his business in all its branches; can have an excellent character from the gentleman he is about leaving. His wife can take the charge of Poultry, or a Dairy, if required.—Address, W. W., Post-office, Woodford, Essex.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a steady, active, Married Man, aged 38, who has a general practical knowledge of his business—Flower, Kitchen, and Forcing Departments; well acquainted with most kinds of soils; Breeding and Rearing of Stock; Nursery and Forest Cultivation. Can be well recommended from a family of great respectability whom he last served.—Direct to P. M., care of Mr. Ellens, Grocer, Kingston, Surrey.

WANTS a SITUATION as GARDENER, a Married Man, without a family, 35 years of age, has a practical knowledge of his business in all its various branches, Grass land, &c. &c. His wife as COOK, as both have lived in the above capacity the last six years; unexceptionable character will be given from their last situation; they have just left. A weekly place will not be objected to. Direct to J. A., Post-office, Parson's Green, Fulham, prepaid.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER—G. H. Nieman, Gardener to the Venerable Archdeacon Berners, and formerly Gardener to P. C. Labouchere, Esq., of Hylands, in Essex, who is competent to undertake a situation where every branch of Gardening is carried on; the advertiser is a married man, age 37, without incumbrance, and will be disengaged the 17th June, or before, if required. Satisfactory reference will be given. Address, G. H. Nieman, Woolverston Park, Ipswich, Suffolk.

WANTS a SITUATION as GARDENER, a Married Man, with no family, age 50, who has a general practical knowledge of his business, and can have a good character from his last situation, where he lived 22 years. He had under his management a Conservatory, Greenhouse, and Camellia-house, a Flower-Garden, Shrubbery, &c. The Forcing Houses were Pines, Grapes, Figs, Peaches, and Melons, with an extensive walled Kitchen-Garden. Letters addressed prepaid to F. G., George Place, South-street, Camberwell, Surrey, will be duly attended to.

WANTED, in a Small Family, to board in the House, a GARDENER for a small Kitchen, Flower Garden, and Greenhouse; to milk one Cow, and take charge of the Stock on a few acres of Pasture.—Letters, stating terms, where the applicant has lived, and to whom reference can be given, to be addressed to T. M., Mr. Mudie, Stationer, Coventry-street, who will forward them to the advertiser.

WANTED a SITUATION as GARDENER.—W. P. Ayres, author of Culture of the Cucumber in Pots, and of a Popular Illustration of the Principles of the Grouping System of Flower-Gardening, now in the Press, &c. &c., having nearly concluded his engagement as Gardener to John Dobede, Esq., Place, Soham, Cambridgeshire, is at liberty to enter into an arrangement with any Nobleman or Gentleman in want of a responsible servant in the above capacity, or as GARDENER and STEWARD. W. P. A. has had extensive practice in all the practical departments of his profession, as well as in Landscape Gardening and Garden Architecture, of which he can produce Testimonials of the highest description from his present esteemed employer, as well as from many of the first horticulturists of the day. He is married, and 30 years of age. Application, personal, (which would be preferred), or by letter to W. P. A. as above; to Mr. Malleron, Royal Gardens, Claremont; or to Mr. T. Rivers, Jun., Sawbridgeworth Nurseries, Herts, will meet with immediate attention.

MAWE'S GARDENER, BY MAIN.

Twenty-fourth Edition, with great improvements, and the whole brought down to the present state of Horticultural knowledge, 12mo, 6*s*. cloth lettered.

EVERY MAN HIS OWN GARDENER.—Being a complete Gardener's Calendar and General Directory; containing Directions for all Work necessary in the

Kitchen Garden,
Orchard,
Hot-beds,
Flower Garden,
Pleasure Garden,
Shrubbery,

for every Month in the Year; with Practical Directions for Raising, Propagating, and Forcing; and also Observations relating to Soils and Situations. To which is added a Complete Systematic Catalogue of Plants, proper for Cultivation in British Gardens, with Directions for their Culture. By THOMAS MAWE and JOHN ABERCROMBIE; and revised and continued by JAMES MAIN, A.L.S.

Longman, Brown, and Co.; T. Cadell; J. M. Richardson; Hatchard and Son; Baldwin and Cradock; J. G. F. and J. Rivington; S. Bagster and Sons: Hamilton and Co.; Whittaker and Co.; Sherwood and Co.; Duncan and Malcolm; Harvey and Darton; Simpkin, Marshall, and Co.; T. Hearne; Cowie and Co.; Smith, Elder and Co.; Houlston and Stoneman; J. Capes; E. Hodgson; J. Wacey; H. Washbourne; and C. Dolman.

LINDLEY'S ELEMENTS OF BOTANY.

Illustrated by many hundred Figures on Wood. In 1 Vol., 8vo, price 10*s*. 6*d*.,

ELEMENTS OF BOTANY, Structural, Physiological, Systematical, and Medical. Being a Fourth Edition of the First Principles of Botany. By John Lindley, Ph.D., F.R.S., Professor of Botany in University College, London.

"The skill of the wood-engraver has enabled the author to fill his pages with Illustrations, explanatory not only of the technical terms employed in Botany, but also of the natural orders of plants. An analysis of the latter upon the plan of Lamarck; an account of De Candolle's celebrated system of arrangement, into which a large number of woodcuts are introduced, and some new views, relating to natural classification, are added to the matter to be fo[illegible]d in previous editions."—*Preface*.

Printed for Taylor and Walton, 28, Upper Gower-street.

HORTICULTURAL SOCIETY OF LONDON.

THE ANNIVERSARY MEETING of this Society, for the Election of President, Council, and Officers for the Year ensuing, and for receiving the Annual Report of the Auditors, will take place at the House of the Society, No. 21, Regent-street, on Monday, the 2d of May. The Chair will be taken precisely at One o'clock.

The Gardeners' Chronicle.

SATURDAY, APRIL 16, 1842.

MEETINGS IN THE ENSUING WEEK.

	Linnean	8 P. M.
Wednesday	Geological	8½ P. M.
	South London Flor. Soc. (Horns Tavern) . . .	1 P. M.

On many recent occasions we have told our readers, in either express or implied terms, that they should so treat manure as to prevent its smelling; because, if it does smell offensively, the most valuable part of it is lost. Some of our correspondents do not seem to understand this, but appear puzzled to comprehend why so much importance should be attached to the odour of anything, and how the smell of one form of matter can contribute to the nutrition of another. It is because we find that misconception exists upon this plain and simple subject that we have thought of making it the object of more formal observations.

Among the common people air is supposed to be nothing because it cannot be seen; and when it is felt by being agitated, we suspect that many who are exposed to it imagine that the wind which blows upon them is something brought from a distance, and different from the air which constantly surrounds them. We are not sure, indeed, that, when they fill a bladder with air, and after tying its neck find it impossible to press it flat again, they understand it to be the air which becomes palpable; because, when the bladder is rent nothing is seen to escape again. It is a pity that air is not red or blue, or some other marked colour, in order that such persons might be convinced that it really is a something. And yet when a bladder half filled with this invisible impalpable substance called air is exposed to the fire and swells until it bursts with a loud report, one would think that such a circumstance would be a tolerably convincing proof that air is something enclosed within the bladder. We are afraid, however, that people are apt to fancy it to be the bladder alone which *somehow* stretches, although they know not how. We must, nevertheless, entreat them to believe that air, invisible, untouchable as it is, is something; and moreover, a most important part of our natural food, without which we could no more exist than without those solid and grosser matters which constitute our visible nutriment.

In its natural state air has no smell. When, therefore, it has a smell, it is because something is added to it; for if nothing were added it would always remain without smell. Now, that something which is added to the air, and causes an odour, must have had an origin; for nothing comes out of nothing. We all know that smells are of various kinds, oppressive, stimulating, caustic, or deadly; that the smell of violets acts upon the nerves and causes fainting, while that of hartshorn produces excitement. Why is this, unless because something imperceptible to our sight or touch is floating in the air? That something which is thus surrounding us in an invisible form was once solid, before it escaped from its prison to disperse itself through the air; and by the power of chemistry it may again be caught and imprisoned; as water which, when driven into the air by heat, and made invisible, may be condensed into its original fluid state.

Now, the nature of plants is such that they are unable to feed upon solid substances, like animals; they can only absorb their nutriment in a fluid or still more subtle condition; and it appears certain that many substances can be best received into their system which most readily pass into the form of air. Such, among other things, is ammonia, that invisible matter which makes our eyes water when drawn into the nostrils from a bottle of smelling-salts; and which is beyond question one of the most powerful parts of all manure, forming, in combination with other air-like substances, that which gives it its offensive smell. In its ordinary state it is extremely volatile,—or, to use a more English expression, it is always flying away from whatever produces it, and losing itself in space; so that unless there were some means of arresting it in its progress, plants would be deprived of it, notwithstanding the prodigious abundance with which nature provides it for their use. In general it is caught up in mid-air by rain, which dissolves it, and carries it back to the earth; and so, strictly speaking, none of it is lost: but although our planet may not lose any of it, yet, under natural circumstances, it is dispersed to places where it is not wanted, and so wasted. The business of the husbandman should be to prevent this waste, by catching and saving it for those particular purposes for which it is really needed. His only mode of saving it is by destroying its volatility, or power of flying away, in doing which he also destroys to a certain extent the smell of the bodies from which it proceeds; for to diminish their smell is to diminish their loss of ammonia.

This is the reason why gypsum, green vitriol, sulphuric and other acids should be poured over or mixed with dunghills as soon as they are made up. Those substances catch the ammonia, and keep it in the manure—no matter how. But they so catch it that when manure decays and is mixed with the soil, it is able to restore the ammonia to the water which falls upon it, by which means it is instantly conveyed to the roots of plants, which thus are enabled to feed upon it.

We trust that, after this homely explanation, there will be no one of our readers to fancy that the odour of a substance is nothing; and, on the contrary, that they will fully understand that to arrest the odour of the offensive substances necessarily employed in agriculture is not merely to consult our own feelings of comfort, but also most effectively to improve the manuring quality of the materials so employed; while on the other hand, to purify manure, by allowing the odour to fly away, is to destroy all the most valuable part of it.

It may be useful to the exhibitors of Pelargonium at the ensuing meetings in the garden of the Horticulr tural Society to know that the table on which theis plants will be placed will be of the same dimensions and form as in former years, but not more than six inches off the ground; so that the plants will all be below the eye of the observers.

Some months since we mentioned the important fact that nitrate of soda is a most valuable manure for Fir-trees. Mr. Rivers, of Sawbridgeworth, had applied it at the rate of 1½ or 2 cwt. per acre, at the time when Spruce Firs were making their shoots; and the change produced in the appearance of the trees operated on was most remarkable. From a pallid, yellow hue, the leaves became of the richest and deepest green, and the trees grew twice as fast as those not nitrated. We are the more anxious to remind our readers of this fact, because the time for applying the nitrate is arriving, and because it is the only form of manure that, as far as we know, it has ever been found possible to apply to Coniferous plants with advantage. Common farm-yard manure is well known to be fatal to them; and we apprehend that other complicated manures, such as Guano, will be found to be equally deleterious.

IS THE MALE ASH OF GREATER VALUE AS A TIMBER TREE THAN THE FEMALE AND HERMAPHRODITE ASHES?

(*Concluded from page* 236.)

Many instances in support of these propositions must on reflection occur to all. It may, however, be as well to mention two or three facts in illustration. If a Melon plant is allowed to bear fruit at a very early period, and before a sufficient supply of true sap has been prepared and stored up for its support, the Melon will shortly prevent the extension of the roots and stem, by absorbing the sap as fast as it is formed by the leaves; and it will finally destroy the plant by exhaustion, as was proved by Mr. Knight. The valuable treatise on the culture of the Vine by Clement Hoare abounds with illustrations on this point. As an extreme case of the exhausting effects which the production of a large crop of fruit has on the vital energy of a plant, I select the following:—Mr. Hoare suffered a Vine which was in the highest bearing condition possible to retain as much bearing-wood and fruit as was supposed would either kill or cripple it for several years to come. The result was, the Vine could not bring the fruit to maturity. The shoots ceased to grow, and the leaves withered and fell much sooner than those of other Vines which had not been so treated. In the following spring, not a single bud unfolded till nearly a month after the usual time, and the largest shoot it made that season was only 26 inches in length, and no thicker than a packing-needle, although in the previous year it had emitted very vigorous shoots 25 feet in length. After the lapse of eight years, with the best treatment, the plant had not acquired its former vigour. On the contrary, if an annual is not suffered to flower and seed, it will live two or more years, and the stem will acquire somewhat of a shrubby character. If we plant an Onion, and allow it to blossom and seed, the bulb will be absorbed, and no fresh one formed. But destroy the flowers as they appear, and the formation of other and larger bulbs will be the result. By plucking off the blossoms of the Potatoe, the weight of the tubers is considerably increased. If a gardener has a new shrub, or, in fact, any other description of plant, which he wishes to propagate, he knows that one of the most effectual means of increasing its strength and vigour is to prevent the formation of flowers and seeds. There can be no doubt, then, that the true sap which enters into the composition of fruit or Seeds will, if the growth of these be prevented, promote the growth of bulbs, tubers, and wood. And consequently, if a vigorous tree, like the male Ash, does not naturally produce seeds, it must have much more disposable matter for the extension of roots and branches, and to deposit in its wood, than a tree of the same kind which bears seeds freely.

It is probable that no difference will be observed in the growth of the male and female Ashes in their youth, nor for some years after the females have borne seeds; but as they grew older, and the female became more prolific, there can hardly be otherwise than a manifest difference in their appearance. There must be some visible sign of less vigour in the female trees.

The size of the buds in spring, the size and depth of colour of the leaves in summer, and the time at which they fall in autumn, afford, as I have observed in the case of fruit-trees, most excellent criterions whereby to judge of the comparative vigour of different trees of the same variety, grown under similar circumstances. The larger and the deeper the colour of the leaves, and the longer they continued green and in an efficient state in autumn, the more healthy, vigorous, and strong I have found the plant to be. Have we any such evidences of the comparative vigour of the male and female Ash-trees? Gilbert White, in his delightful "Natural History of Selbourne," observes, "Many Ash-trees bear loads of keys every year; others never seem to bear any at all. The prolific ones are naked and unsightly; those that are sterile abound in foliage, and carry their verdure a long while, and are pleasing objects." Philip Miller, also, observes, "that the female Ash-trees generally exhaust themselves so much by bearing keys or fruit, that their foliage is scanty, and their appearance unsightly. The trees, however, which bear male flowers only have a full and verdant foliage, and make a handsome figure, though late in the season." Mr. Loudon has a similar observation in his Arboretum Britannicum. May we not then conclude, that the more abundant foliage of the male Ash, as compared with that of the female, is a satisfactory proof of the superior vigour of the male tree? It seems, from an observation of Gilbert White's, that the male Ash also retains its leaves later in the season than the female. In speaking of the falling of the leaf, he says, "One of the first trees that becomes naked is the Walnut. The Mulberry, the Ash, especially if it bears many keys, and the Horse-Chestnut, come next." Should these observations be hereafter proved correct, and of which there can be little doubt, the difference caused by the non-production of seeds, the greater breadth of foliage, and the gain consequent on retaining the leaves later in autumn, must make such a difference in the trees, that the wonder will be, not that there should be any difference in the male and female trees, but that it has not been observed by every one who has had aught to do with the growth or felling of the Ash.

I have not met with any remarks on the Ash in support of the opinions mentioned by Billington, that the male Ash makes a larger tree than the female. Gilbert White, however, has noticed a difference in male and female Yew-trees. He says, "As far as he has been able to observe, the male trees become much larger than the females." In Loudon's notices of remarkable Yew-trees, the sex of three only is mentioned, and they are all said to be males.

I will now make one or two quotations, showing that the strength or solidity of wood is probably lessened by the production of seeds. Many observations bearing on this inquiry may be found in Mr. Knight's admirable paper "On the State in which the True Sap is deposited during Winter." Mr. Knight was evidently of opinion that the production of seed by a tree must affect the value of its timber. The blossoms of trees, he observes, receive their nutriment from the alburnum, particularly as the blossoms of many species precede their leaves, and as the roots of plants become weakened and apparently exhausted when they have afforded nutriment to a crop of seed. We may suspect that a tree which has borne much fruit in one season becomes in a similar way exhausted and incapable of affording proper nutriment to a crop in the following year; and he adds, "I am much inclined to believe, that were the wood of a tree in this state accurately weighed, it would be found specifically lighter than that of a similar tree which had not afforded nutriment to fruit or blossoms in the preceding year or years." The difference in the value of the timbers of fertile and barren trees appears to have been understood in Evelyn's time, for he says, "Trees of the wilder kind and barren are esteemed better than the overmuch cultivated and great bearers." And more conclusive still, when speaking about felling Ash-trees, he says, "The very axe will tell you the difference of the sex, the male being so much harder and browner than the female."

I think I have now shown sufficient reasons for concluding, that it is highly probable that the male plants of the Ash and Yew, or of any other diœcious or polygamous species of trees, grown with a view to timber, will in the end be much more valuable than the female or hermaphrodite trees. From the many useful purposes to which Ash timber is applied, it may be considered, of all our forest-trees, next in value to that of the Oak. And if it be true that the male plants will make a greater quantity of more valuable timber in a given time than the females, it is desirable that the fact should be determined and supported by direct experiments, so that it may be generally known and believed, and turned to a useful account. I trust that some one will be induced to make experiments on the subject.

It is well known that Mr. Knight was of opinion that considerable advantages would arise by obtaining vigorous varieties of the Potato, which would not naturally blossom and seed, because he had proved that the same sap gave existence alike to the tubers and blossoms and seeds, and therefore, whenever a plant of the Potato affords either seeds or blossoms, a diminution in the crop of tubers, or an increased expenditure of the riches of the soil, must necessarily take place. He succeeded in raising many varieties of Potatoes which did not seed; and I have no doubt whatever that the time will come when endeavours will be made, by means of cross-breeding, to obtain similar varieties of the Oak and Chestnut, and of other trees which have a union of the sexes in the same flower or on the same tree.

As it is now some time since Mr. Billington's attention was directed to the difference in the male and female Ashes by the old wheelwright, he may have observed them more critically since then, and may consequently be able to communicate some further information respecting them. —*John Townley.*

ON PLANTING AND MANURING POTATOES.

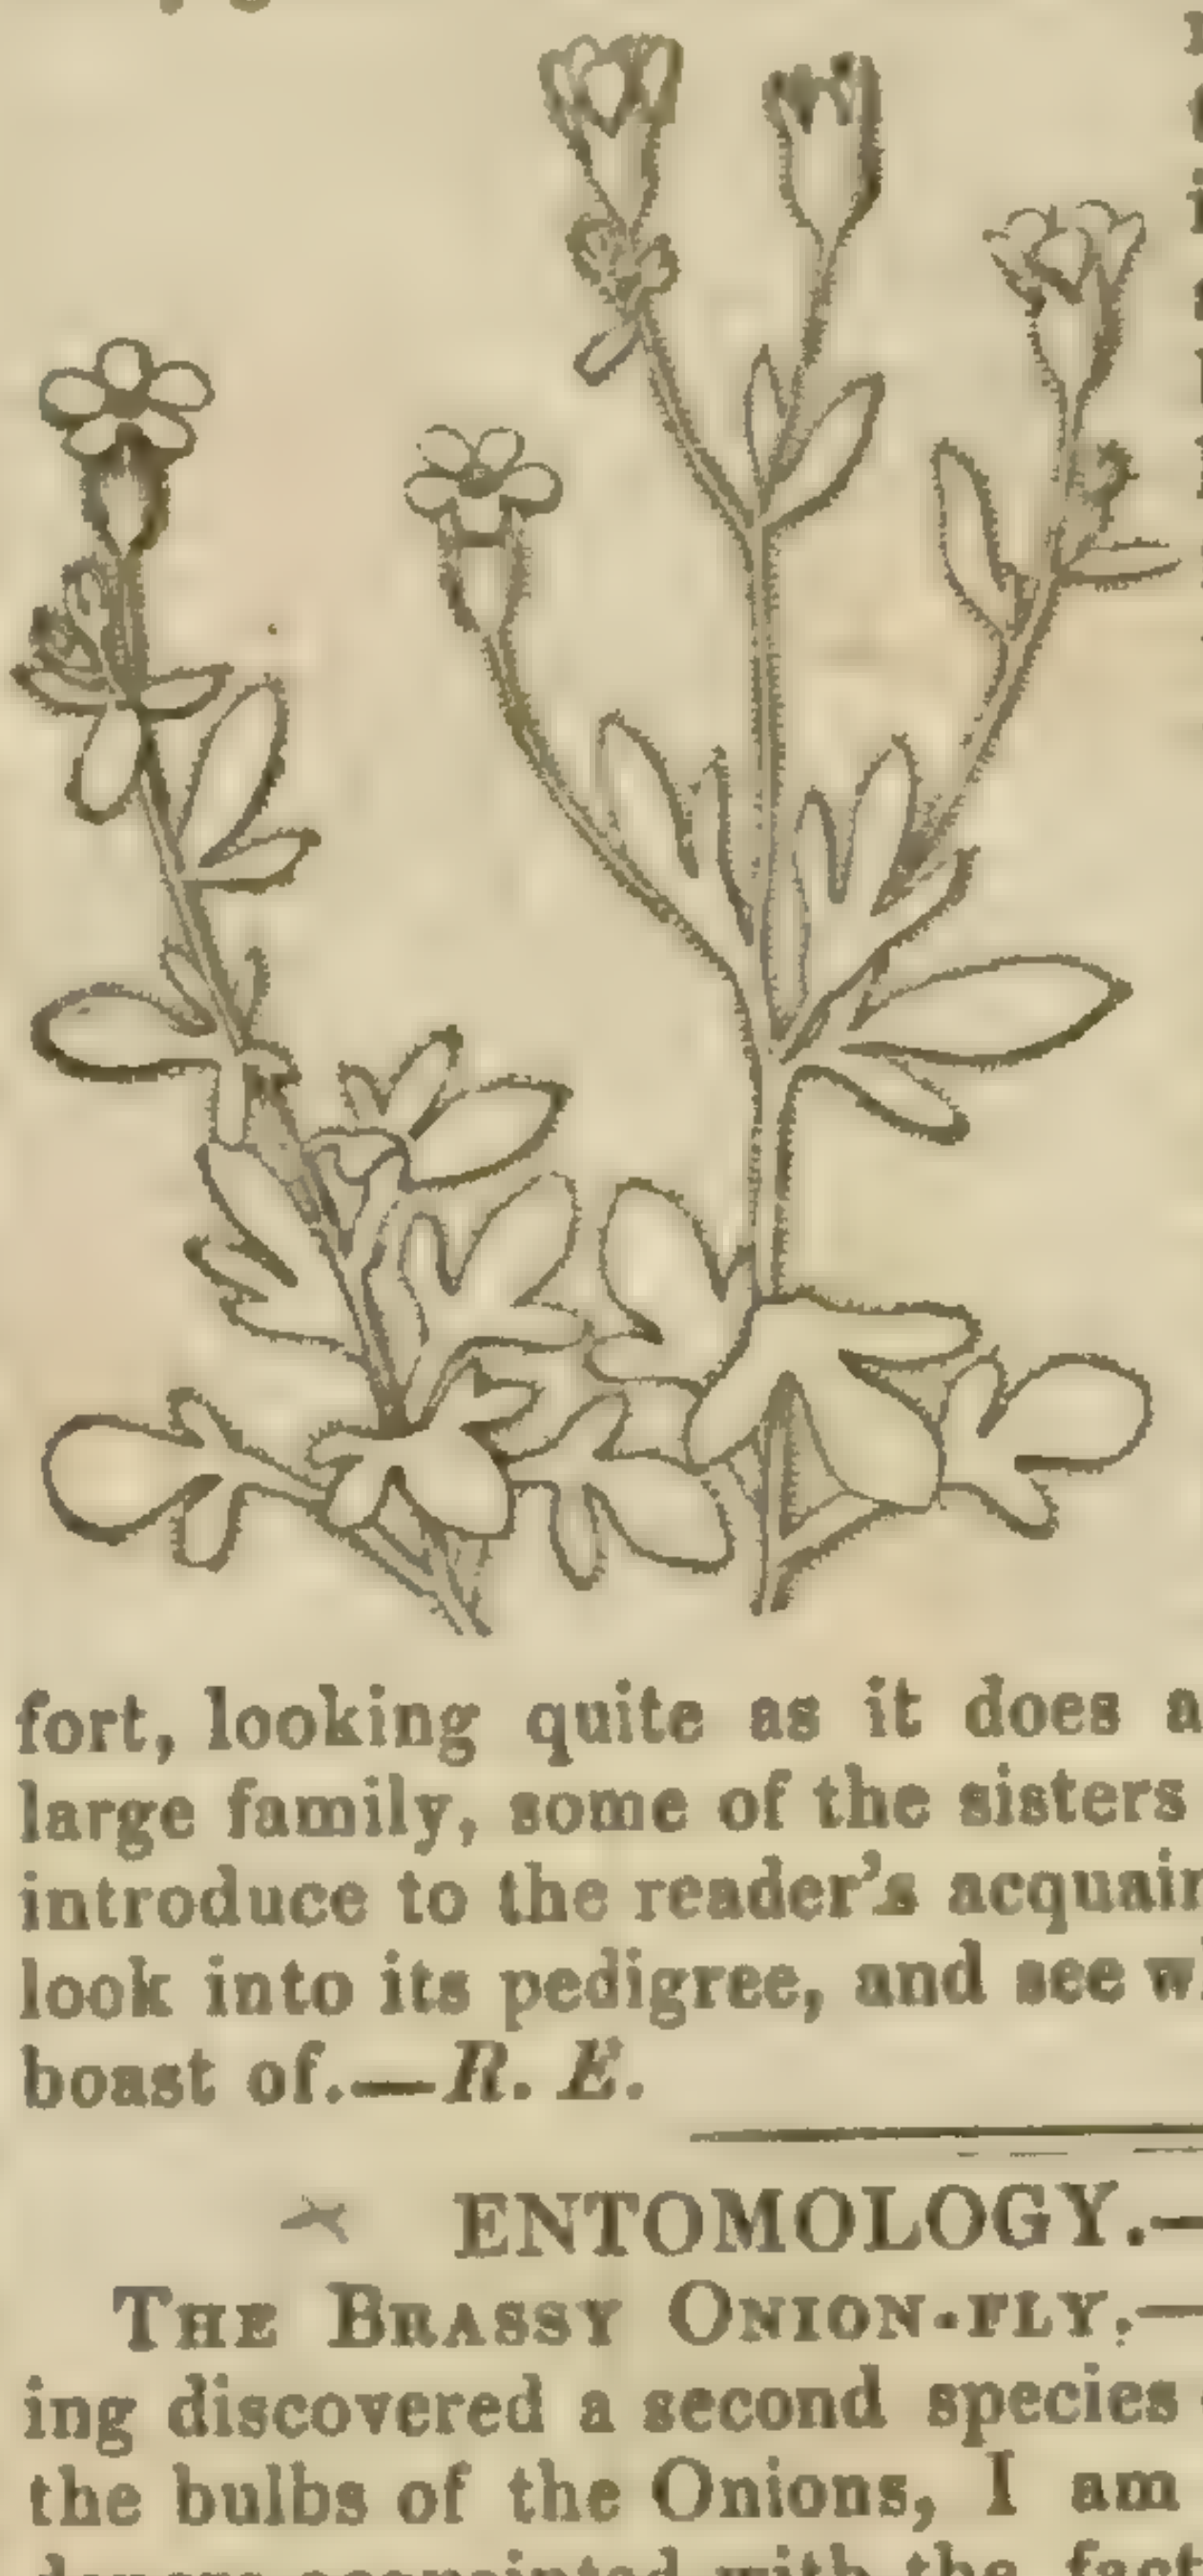
A NUMBER of articles on the culture of Potatoes having appeared in the *Chronicle*, some may think that the subject is exhausted; but I have not seen any reference to a mode of planting that I think a very good one; at least, I have often planted them in that way, and with the greatest success. In the early part of winter, the sooner the better, the ground must be dunged and ridged in the usual way, making the ridges the same width as the potato-drills are meant to be. In this state the ground must lie until the spring. At the proper season of planting, deepen the space between the ridges a little, making a drill with the hoe; and in this plant the Potatoes. They must be covered with the hoe by drawing from each side of the ridge as much of the fine soil, mellowed by the winter frosts, as is sufficient to cover them properly; the ridges may not be completely levelled, but what remains is peculiarly useful when they come to be earthed up. I need scarcely mention the great advantage of planting in a soil well prepared; and although Potatoes will grow, and may grow well in a soil not so well wrought, yet they will grow better when it is well dug and properly pulverised; and no way of preparing the ground is more easily or sooner done than that which I have described; and as to planting, you may plant much more in a given time than by any other method. It is, probably, well known to many, although I do not recollect of ever seeing it noticed, that woollen rags are an excellent manure for Potatoes. The rags are cut up into small pieces, and put under the sets at planting, and the effect produced is wonderful; it is a long time since I planted any in this way, nor did I ever at the time make any particular observation as to the quantity produced; but this I can say, that they far exceeded those that were manured in the usual way. The time for planting Potatoes may be over in the south, but it is not so in the north; nor is it too late in any quarter to try the experiment, if any of the numerous readers of the *Chronicle* choose to do so. It might heighten the effect if the rags were dipped in, or saturated with, ammoniacal gas liquor; at least it might be interesting to make the trial.—*Wm. Falla, Lisswood House, near Haydon Bridge.*

FAMILIAR BOTANY.—No. V.

> We will entangle buds, and flowers, and leaves,
> Which twinkle on the fountain's brim, and make
> Strange combinations out of common things.—*Shelley.*

The Three-fingered Saxifrage.—Poor little flower, born on the bleakest walls, and starving among crumbling ruins, how grand a name is thine and apparently how little commensurate with thy power! The Stone-breaker!—for so they have chosen to call thee, as the little learned can explain—one would have expected, at least, a giant among flowers, armed with mallet raised aloft on sinewy branches, ready in its fall to crush the rocks beneath it. To nothing less than the giant Pine-trees of the Western World does the name of Stone-breaker seem applicable, colossal trunks springing from the ruined mountains which they split as they grow, and rend beneath their weight when they fall in the helplessness of age. But thou, poor little flower! why art thou called Saxifrage? Is it in mockery of thy feebleness, or why? Rouse thyself, poor fragile child, and tell the scorner that the battle is not always to the strong nor the race to the swift; point to the time-worn masonry on which thou sittest, to the fragments of cement yearly displaced by thy little roots, and boldly say that thou, too, art a stone-breaker. Feeble are thy powers, invisible to our senses are the steps by which thou pursuest thy quiet course, but not less certain are the effects for the fulfilment of which thou art appointed. Iron is destroyed by the viewless air, and rocks are crumbled by the agency of powers such as thine.

Such were the musings of a dreaming botanist one early day in April, when, after scrambling to the top of old Richborough Castle walls, he found the crest of the ruins studded with Saxifraga tridactylites, opening its first flowers and sparkling as it were with crimson dew. It was not without cause that somebody, in days long past, called this the "Three-fingered," for not only are its leaves pretty uniformly divided into three parts, but in dry places they are thick and firm as the fingers of a stout glove. In fact, they partake in no inconsiderable degree of the property of those plants we commonly call succulents; and hence its power of establishing itself in places where most others would perish of drought. Old dry walls of all kinds are its favourite resort, especially the crest, where no water can lodge, and where, consequently, all that can be had in the form of food for vegetation must be the air and dew of heaven. It is a hairy little fellow, sunburnt, and dwarfish. Two or three inches are its usual height, and its surface is entirely covered with reddish brown specks, standing on the end of short stiff hairs, and glittering in the sun. The lowest only of its leaves are really three-lobed; as they rise upon the stem they become undivided, and gradually diminish in size until the topmost are not a quarter the size of those at the bottom. It is from the bosom, or, as botanists say, the axil, of the topmost leaves that the flowers grow on slender stalks, drooping at first, but afterwards erect. They have a short brown cup or calyx, whose brim is neatly clipped into five short divisions. From the inside of the brim five small white petals rise up. Within those we have ten very short stamens, each tipped with a golden point; and in the centre of all stand a pair of styles, spreading away from each other in opposite directions. They lead us to the ovary or little chamber where the young seeds lie; for the ovary is always at the bottom of the style. In our little Stonebreaker this part, so important to it, is hidden up in the bottom of the cup of the calyx, which has actually grown over it and guards it from all danger of perishing under the dryness the plant inhabits, until its allotted time shall have arrived. It then opens by two small chinks in its head, dries up, and out fall myriads of seeds too fine for the unassisted eye to examine.



Small as is this little wild flower, it is a great traveller. It is found in plenty on the Pyrenées and the Alps of Piedmont; and even in Mesopotamia, on the banks of the Euphrates. Col. Chesney found it sitting among the stones of an old Turkish fort, looking quite as it does at home. It belongs to a large family, some of the sisters of which I may some day introduce to the reader's acquaintance, when we may also look into its pedigree, and see what sort of relations it can boast of.—*R. E.*

ENTOMOLOGY.—No. XXVII.

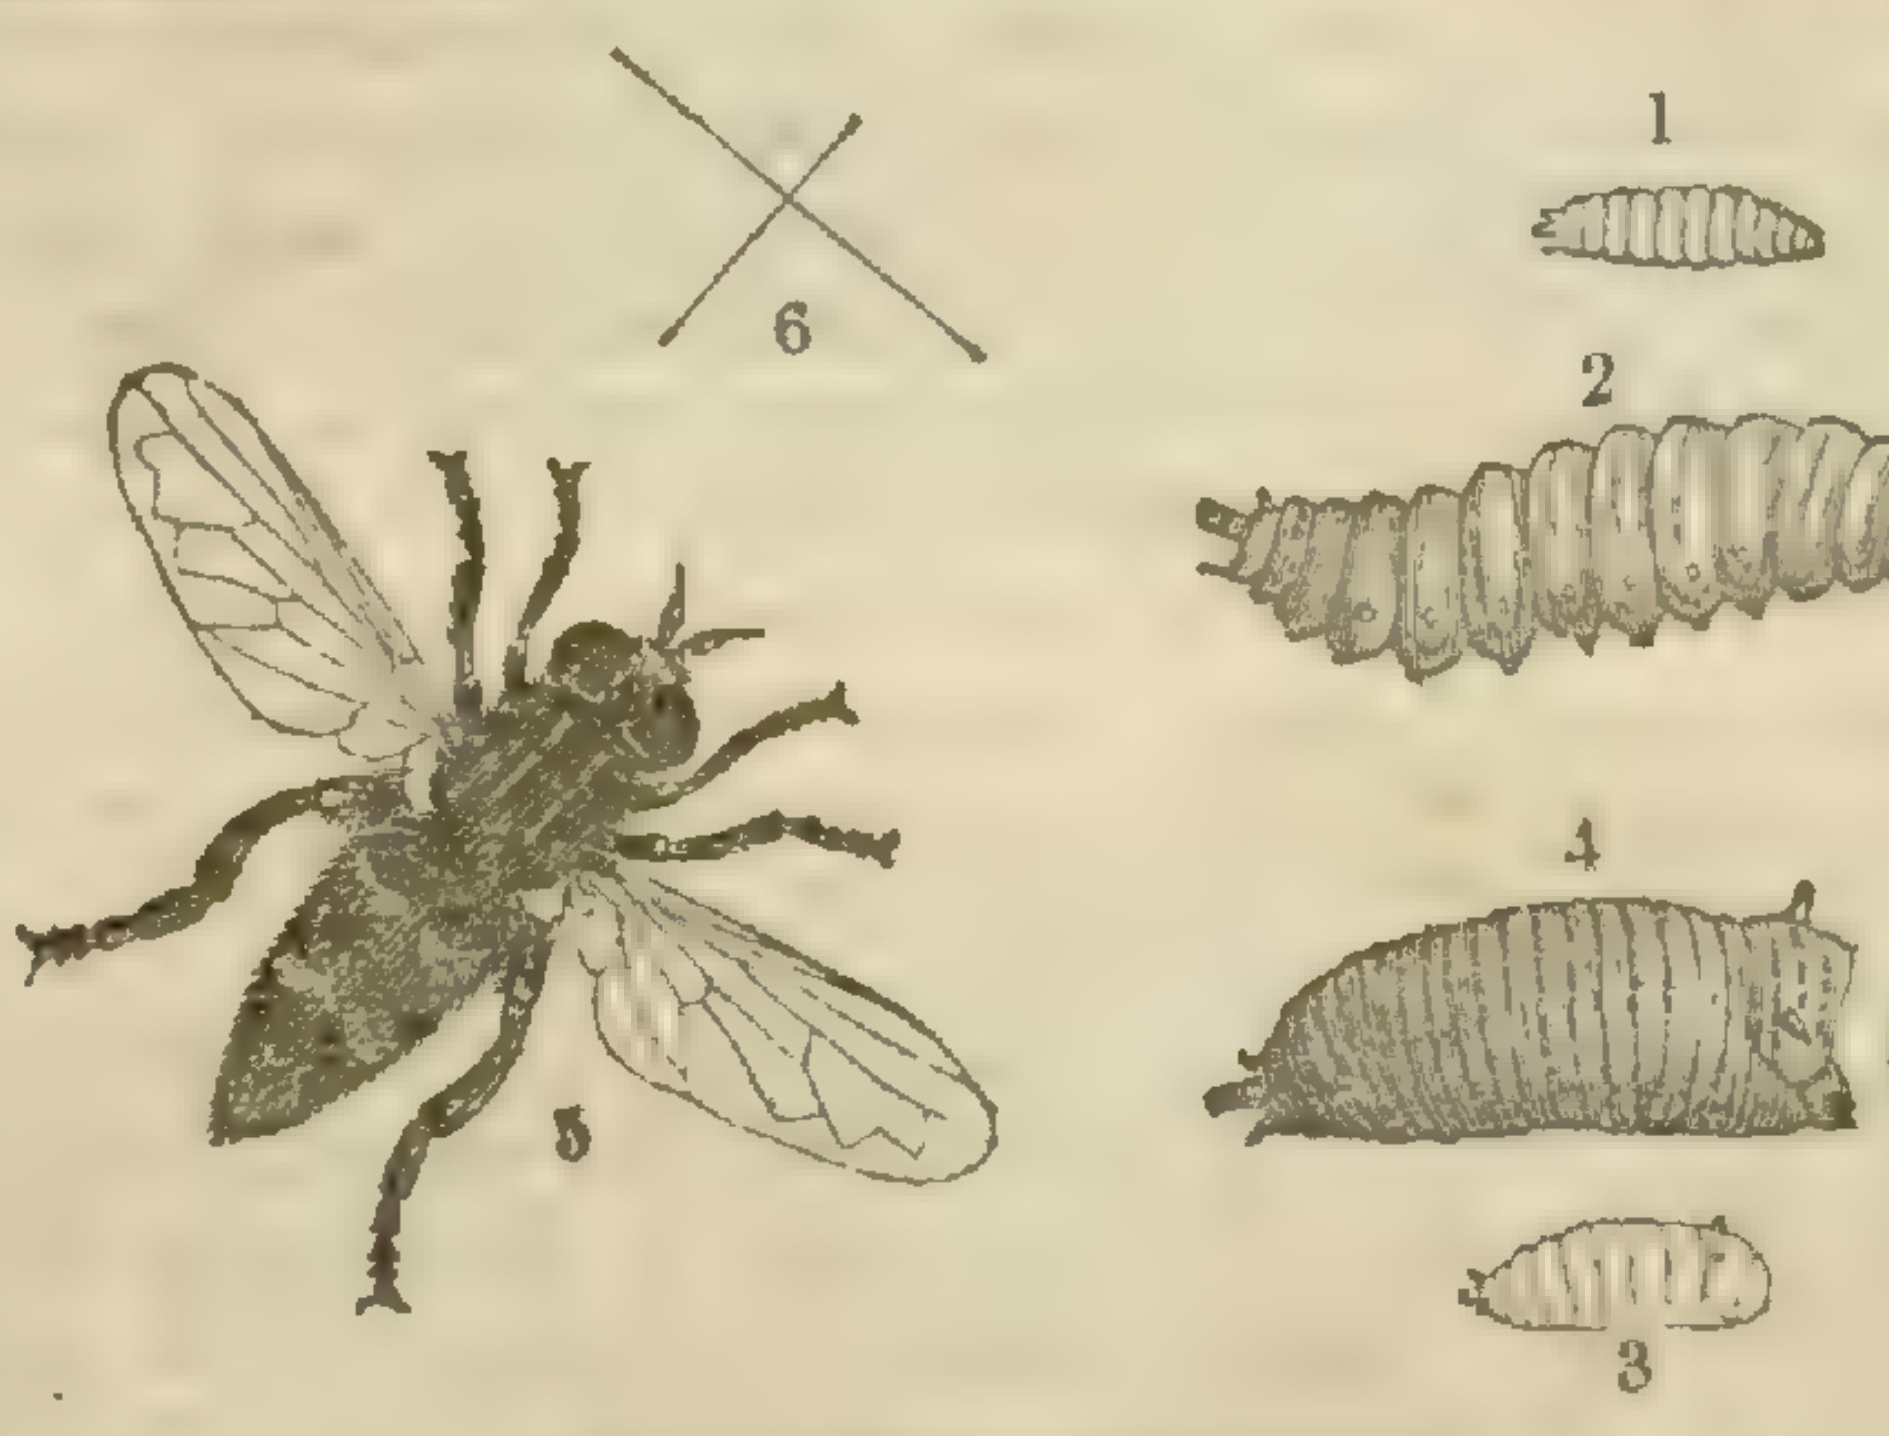
THE BRASSY ONION-FLY.—*Eumerus æneus.*—Having discovered a second species of fly whose larvæ destroy the bulbs of the Onions, I am desirous of making gardeners acquainted with the fact, and even to those engaged in the study of Entomology it will prove interesting, as the economy of the genus Eumerus has remained a secret until the present time, notwithstanding the attention which has been paid to the Diptera. During the autumn, when I was rearing and investigating the common Onion-fly, whose history has already been given in the *Gardeners' Chronicle*,* I detected in a box containing some Onions which had become putrescent a considerable number of maggots (fig. 1), which at once appeared to me as being different from those of the Anthomyia ceparum: instead of being smooth they were very rough, from a multitude of short spines or rigid bristles which covered their skins, especially towards the tail; they were ferruginous or brownish, from the slime of the Onions in which they were living; their heads were obtuse; on the belly the segments were provided with tubercles, which served as feet when they wriggled and crawled about, but they were much less active than maggots generally are; similar tubercles were also distinctly visible under the apical segments, and the last had two short spines on each side with a horny truncated process between them (fig. 2 magnified); the head was never stretched out like many other maggots whenever I observed them, but the spiracles down the sides were more visible than usual. In December I found most of them had died, owing to the remains of the bulbs having dried up, but a few of them were transformed into pupæ (fig. 3); the skins of the maggots had now become indurated, more cylindrical, and somewhat elliptical, but slightly curved at the tail; they were of a reddish ochre colour freckled with dark brown, and there were two spiny processes like short horns upon the thorax, in the female at least, for I did not see them in the male; but it is possible that the piece to which they are attached might have been lost when the male flies made their escape from the pupa-case; for when the period arrives for the flies to issue forth, they burst open the head-piece, which falls off as represented at fig. 4, which is magnified, and discover a beautiful interior, which is clothed with a delicate membrane of a pearly colour, like the interior of an oyster-shell: the tail exhibits spines and a process similar to those of the maggots.

About the last week of April, both sexes of this handsome fly hatched; the male is smaller than the female (fig. 5), and is readily distinguished by the eyes meeting on the forehead. These insects belong to the family Syrphidæ; several species are recorded as inhabitants of this country,† and the Brassy Onion-fly appears to be described by Macquart under the name of

Eumerus æneus.—It is densely clothed with short hairs, thickly and distinctly punctured, and of an olive-green colour, with a brassy tinge; the antennæ are entirely black, the seta naked; the face is very hairy, simply convex, and silvery white; eyes dark brown and slightly pubescent; rostrum very short; thorax with two whitish lines down the back; scutel semiorbicular, the margin thin and somewhat denticulated and ciliated; abdomen linear in the males, the segments coarctate or constricted at the base—attenuated to the apex in the female, with six grey lunulate marks, three on each side and nearly meeting on the back; wings transparent, the nervures piceous, the apical transverse one somewhat bilobed; poisers yellowish white; legs rather short and stout, especially the hinder, the thighs being incrassated and serrated beneath with a double row of minute teeth; tibiæ all bright rust-colour at the base, the hinder curved; tarsi 5-jointed and black, the hinder orange-colour on the inside; the claws are small and the suckers bilobed. Fig. 6 shows the dimensions of the female.

The maggots of this fly do not seem to be confined to the Onion, for I bred one in the middle of May from Cabbage-roots, and specimens have been taken flying about hedges in June and July in the neighbourhood of London and Bristol. As it often happens, the female has not been observed depositing her eggs; the spot that she selects is, therefore, yet unknown; from the larvæ dying in considerable quantities in the box, where the Onions had dried up, it is pretty evident that drought does not suit them; it may, therefore, be presumed that the maggots luxuriate in damp seasons; but the same state of the weather would tend to check the increase of this insect by preventing the flies from pairing and laying eggs.

In addition to the remedies suggested at p. 296, &c., it is said that by putting soot above the roots, the Onions will be effectually protected from all maggots; and lime-water may be applied to such an extent that the lime may lie one-eighth of an inch upon the surface without injuring the crop. It is also believed by some gardeners that watering the Onions with gas-tar or any fœtid liquor, as stale soap-suds and a little old tobacco-water, will deter the flies from laying eggs; this is possible, but it cannot be that the odour is disagreeable to them, as nothing can be more offensive than the putrid Onions in which they live.—*Ruricola.*



FLORAL ANALOGIES.

1. Acrostichum aureum. Golden Acrostic Plant.—This beautiful West Indian Fern analogises particularly with the poet. It is said to be formed from the words *ακρος στιχος*, the beginning of a verse, and to have been so termed because the reverse of its leaves is traced over in a way resembling the commencement of lines of verse.

2. Gymnogramma pedatum. Pedate Gymnogramma.—This plant and others of its genus analogise with the Abecedarian; they are Alphabetical Ferns. Gymnogramma is derived from *γυμνος*, naked, and *γραμμα*, writing, as expressive of the disposition of the naked sori upon the forked veins of the frond, which appear to resemble Roman characters. In connexion with the Gymnogramma and the Acrostichum, the analogical etymologist will not forget the Delta Moth, so termed from its having impressed upon its wing, as though it had been a student insect, and had so loved inwardly in its heart the mystical triangular third letter of the Greek alphabet, that the Δ became outwardly expressed upon its body. Nor will the analogical conchologist omit to recollect the Harpa musica, or musical harp shell, on the exterior of which are most beautiful bars and notes of music, very distinctly visible.

3. Adiantum Capillus-Veneris. True Maiden's Hair.—Adiantum is derived from *αδιαντος*, dry. According to Pliny, however, if you plunge it in water, it returns out dry. In this it analogises with the human being, who is natured of Divine love. However such a being is plunged in the evil conditions around him, he yet retains unsullied his prior state, as does the true Maiden's Hair, however plunged in water, still remain as unwetted as before it was immersed in the circumambient element.

4. Balantium culcita. Smooth-stemmed Balantium.—The generic name of this plant is derived from *βαλαντιον* (balantion), a purse, on account of the purse-like shape of its indusium, or the membrane which encloses the thecæ of Ferns. It analogises with the prosperous wealthy man, who always carries his purse about with him, and whose ways in the present state of commercial existence are as smooth as are the stems of the Balantium.

5. Isoetes lacustris. Marsh Quillwort.—A cryptogamous plant which remains the same through all the seasons of the year, and therefore analogises with the human being, who is unaffected by climate.

6. Agaricus flammula. Flame-coloured Mushroom.—A species of fungus, gregarious and flame-hued, and therefore analogising with the intellectual light consequented by human congregation; or rather perhaps representing that warmth of feeling expressed by the flame colour, which is only found co-existent with society or a gregarious state.

7. Merulius lachrymans. Common Dryrot.—A plant which grows upon rotten wood, which it softens and ultimately destroys, as a parasite creeps into the confidence of one with some lachrymose tale, and feeds upon his foolish bounty, until he is ruined by him.

8. Dædalea quercina. Oak-growing Sphinx.—A fungus so called from its sinuosities being as difficult to penetrate as was the Dædalian labyrinth. It is the riddle of the vegetable world. We have therefore termed it the Oak-growing Sphinx.

9. Sistotrema confluens. Confluent Sistotrema.—This plant is fragile, scentless, and becomes yellow in age. It thus analogises, as yellow is the colour of gold, with the many persons who become misers when they are old. Miserism among moral evils corresponds with the jaundice among physical diseases.

10. Hedychium coronarium. Crowned Garland Flower.—A plant which requires large pots to make it flower freely, and therefore analogises with those individuals who

s worthy of credit." I beg to add, that all which I have written regarding the G. cardinalis is quite correct, and is "worthy of credit," both with regard to the number of trusses of flowers in the space mentioned, and also as to its being quite hardy, and able to stand our most severe winters without any protection, by following the directions I have given in the leading horticultural periodicals of the present day; but in no other way will it do that I am acquainted with. If your correspondent or any of your readers will pay me a visit when they are in flower (from the middle of July till the middle of August), or in any of the winter months, I think they will be satisfied with what I have said on these points. When Mr. and Mrs. Loudon were on a tour through this part of Scotland last summer, they honoured me with a visit, and were astonished at seeing such a profusion of blossom upon my Gladioli, and said (if I remember right) that they had never seen such a display either in this or in any other country; and it was at the request of Mr. Loudon that I wrote the article which appeared in the "Gardener's Magazine," which your correspondent has so largely quoted.—*A. Mackenzie.*

Salvia patens.—However hardy the Salvia patens may be said to be, I find that two strong plants left out here have perished this winter! although they were covered with at least three inches of decayed leaves. With the same protection Fuchsia Ricartonia, reflexa, grandiflora, virgata, inflata, and globosa major, are living and looking well; this proves S. patens not to be so hardy as those plants of Fuchsias.—*G. G. Watson, Stockton-on-Tees.*

Hybernia Brumata (No. 50, 1841, p. 812). The little destructive larvæ of this moth have just issued from the eggs, and are hanging by the finest threads from the branches of various trees on fine days. They are not above one-eighth of an inch long; the body is slender, and dull green; the head is rather large, and shining black. Syringing the trees at sunrise would now destroy multitudes.—*R.*

The Widgeon.—A few years since a pair of widgeons were kept in the river which bounds the Botanic Garden at Bury St. Edmunds. The male bird was shot during the winter, and in the following spring was succeeded by a wild one (no doubt attracted by the call of the female), by whom it had several young ones, which all left at the usual period of migration, except the pinioned parent. Last year a male bird again made its appearance, and another brood was the consequence. A small portion of their wings have been taken off, and they are now become as tame as any of the other waterfowl.—*N. S. Hodson.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 6th.—The council assembled for the first time at the society's new residence, 12, Hanover-square; his Grace the Duke of Richmond, K.G., in the chair. Twenty-five gentlemen were elected members.—Col. Challoner laid before the council a list of members whose subscriptions were in arrear for 1838, 1839, and 1840; and having stated that two letters had been addressed to each of those gentlemen—the first from the council, and a subsequent one from the finance committee, without effect—the council resolved—"That the President should be requested to address a final letter to each defaulter, and in case of failure on such application, that legal steps should be immediately instituted for the recovery of these arrears." Col. Challoner reported the amount of capital invested in the funds as 6,7[illegible]1*l.*, and the current cash balance in the hands of the bankers as 1,354*l.*—Resolved—"That Mr. Manning, of 251, High Holborn, should be engaged to erect the pavilion and show yards for the meeting at Bristol." Resolved—"That the society's house and property in Hanover-square should be insured at the Farmers' Insurance Institution." The following resolution was agreed to:—"That the Journal Committee be requested to take into their consideration the propriety of directing that all prize essays shall be published in the 'Journal' immediately after the prizes have been awarded." Also, "That the House Committee be requested to class and arrange all books, papers, implements, models, seeds, &c., for the inspection of the members: and that an alphabetical list be made of the same for general reference." Col. Le Couteur, of Jersey, transmitted 28 specimens of Wheat arranged in glass cases, and intended to form a consulting index for the council-room. The council directed the cases to be arranged with those of the specimens of diseased Wheat presented by Professor Henslow.—Capt. Stanley Carr, an honorary member, residing in the Duchy of Lauenburg, transmitted an interesting collection of specimens of wool from fleeces exhibited at Doberan in autumn last, at the great meeting of German agriculturists. These, classed and described by M. Jeppe, of Rostock, amount to 368 in number, and are beautifully arranged (on glazed black card-board) according to assortment of fleece, degree of fineness of wool, loss of weight on washing, and other particulars.—Mr. P. Barnes presented some New Zealand Flax seeds (with the pod), and also a supply of Spurrey seed (of the smooth seeded variety), transmitting, at the same time, an account of Spurrey, of which the following is the substance:—"Spurrey (in Latin, Spergula; French, Sperne; Flemish, Spurrie; and German, Spergel) derives its name 'Spergula' from the Latin word spargere, which signifies 'to scatter,' because it scatters its seeds abroad, to the great profit of the farmer in Holland, who obtains from it meadows affording the most delicious butter. In the Netherlands and Germany, it is sown on loam stubble, to supply a bite for sheep during winter. It may be sown and reaped in eight weeks, either in autumn or spring. It is said to enrich the milk of cows, so as to make it afford excellent butter; and the mutton from sheep fed on it is preferable to that from sheep fed on Turnips. Poultry eat Spurrey greedily, and it is supposed to make them lay a great number of eggs, whether given as hay or cut green, or in pasture. Von Thaer observes, that it is the most nourishing, in proportion to its bulk, of all forage, and gives the best-flavoured milk and butter. It has been recommended to be cultivated in England, but it is not likely that such a plant can ever pay the expense of seed and labour in this country, even on the poorest soil; or, at all events, as Professor Martyn observes, we have many better plants for such soils."—The Mayor of Southampton transmitted, on the part of the mayor, aldermen, and burgesses of Southampton, the offer of Southampton common, consisting of more than 300 acres, for the purposes of the great meeting of the society, in the year 1844.—Various foreign communications were then laid before the council. *Lands.*—Sir J. W. Lubbock having called attention to the importance of an exact acquaintance with the circumstances under which bones are applied as a manure to grass lands, Mr. E. Billyse, of Hayward Farm, Cheshire, favoured the council with the following information:—"When the landlord furnishes the bones, the land manured with them ought not to be mown after the first year. The bones which the landlord supplies his tenant with for his pasture-land are expected to retain their fertilising powers for upwards of twenty years; and, reckoning the money so expended at 4 per cent., and the interest charged to the tenant 7 per cent., the landlord gets his principal paid back in about 21½ years; and his land will then, I may venture to say, be 20 per cent. better than when the bones were first applied. But this would not be the case if the land was mown; eight or nine crops of hay would exhaust the bones, and it would not, therefore, answer the landlord to furnish them for mowing lands, excepting at such a rate of interest as would pay him back his capital in eight years; and I should not advise it then, for in the event of the tenant quitting the farm, after having taken five or six crops of hay, it would be hard upon the new tenant to have to pay the same for the last two or three crops. It is when the tenant pays for the bones that I recommend them for mowing lands. The reason I give for advising that no stock should be allowed to feed upon the land the year bones are applied is, that the bones may get in well and soon, as they do no good so long as they remain above-ground. On the very poor lands, hard stocked, they will not all disappear for two or three years. If the bones are applied at the end of April, and the land is not too poor to produce a crop of hay, I would mow it the first year; and if applied at the end of August, or at the latest at the beginning of September, then put no stock on the land the following spring. The Grasses I should recommend to seed land down with, that is intended for bones, are the following:—Dutch Clover-seed, 5lbs.; Rib Grass-seed, 5lbs.; Meadow Fescue, 5lbs.; Sweet Vernal, 3lbs.; and Perennial Rye Grass, 1 peck: to the statute acre. These are the Grasses which the Cheshire pastures are principally composed of. Our principal stock are dairy cows."—Mr. Dollond submitted an improved barometer for ascertaining the changes of atmospheric pressure. Mr. Dollond states the following as the principal advantages resulting from his arrangement:—1. A true and certain state of altitude in the column of the mercury from the highest to the lowest situation on the globe, without the necessity of applying the uncertain and tedious corrections required in ordinary barometers. 2. The uniformity of the observations, arising from the free and unobstructed condition of the mercury; all the advantages of the open-cistern barometer being thus attained, without the attendant difficulty of arranging the starting-point of measure. 3. The entire exclusion of air from the inner tube or cistern, and the consequent preservation of the surface of the mercury from oxidation. 4. The applicability of this new arrangement to barometers of any diameter, and with exclusive advantages obtained by no other mode. 5. The perfect security in carriage, when the barometer is either out of use or required to be conveyed from place to place.—S. Robinson, Esq., secretary to the Wrentham Farmers' Club, communicated the result of a discussion at that club on the feeding and keeping hoggets or tegs during the winter months so as to prevent loss from dropping:—"The gentleman introducing the question, who had in former years been a sufferer to a great extent from the above cause, had adopted the plan of drawing his Turnips two or three days previously to being used, and was induced to believe the system had proved effectual, as since having pursued it, he had lost none on lands where in past seasons his loss had been very great. It was, however, objected that this system was not decidedly practicable, as it could not be adopted in frosty weather, and it was thought that as much soil would be eaten with the food when the Turnips were drawn previously as there would be if allowed to remain in the ground. Another instance was stated, in which no losses had occurred for several years; the plan adopted was that of allowing the sheep to range on stubbles or pastures for a few hours during the day. In many subsequent statements the evidence was so conflicting that no conclusion could be arrived at, as the same method of keeping had frequently in different cases produced different results: high keeping had invariably been productive of the greatest losses, and it is remarkable that hoggets, badly kept, are seldom subject to this disease. The land in the above instances was considered quite sound for feeding sheep, a portion being a good mixed soil, and in some cases the greatest losses had been experienced on the best lands. The system of feeding in troughs, recently introduced here, had also failed as a preventive, and one gentleman who had adopted it had lost a great number of his hoggets. A proportion of chaff or other dry food is almost invariably given. The prevailing opinion appeared to be that the principal cause of dropping was from an excess of fluid in the gall, but commonly called 'overflowing of the gall,' producing scouring, and causing the death of the animal in a very short time. These observations would apply more particularly to hoggets, as but little loss from the above cause was often sustained in keeping older sheep."—T. Barton, Esq., of Threxton, near Watton, transmitted a horse-ball of a novel nature, by which liquids, such as turpentine, balsam of copaiba, &c., of an oily nature, may be given in a pure state. The "ball" had the appearance of a common glass phial filled with a liquid, corked and tied over with bladder; and it was only on tapping it with the nail of the finger that a person inspecting it could be induced to believe that the charge he held in his hand was not a phial of glass, instead of being, as its dull, hollow, and horny sound indicated, a bottle of semi-transparent isinglass or glue, prepared in a mould and dried. This gelatinous bottle could not, of course, long contain any fluid of a watery nature, which would slowly dissolve it; but it would permanently retain turpentine, balsams, or other liquids, which had no solvent action upon it; while, in both cases, the stomach would speedily dissolve the bottle, and set free its contents, as desired.—Various communications were referred to the Journal Committee.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LOPHOSPERMUM ERUBESCENTE-SCANDENS. Hybrid Climbing Lophospermum. Scrophulariáceæ. Didynámia Angiospérmia. (*Half-hardy Climber.*)—The present plant is a hybrid raised in 1840 by Mr. Turner of the Bury Botanic Garden, from seeds of the Lophospermum scandens fertilised by pollen of the L. erubescens; and it may be considered a decided improvement on the beauty of either parent. It is cultivated at Messrs. Henderson's nursery, Edgeware-road, and there called Hendersónii. Mr. Turner says of this hybrid, "it is remarkable for its strong growth, its bright-green foliage, and above all, the extreme abundance of its flowers, which are of a very superior colour and size, compared with either of its parents. In fact, numbers of persons who have seen it trained up against one of the old abbey walls have pronounced it to be one of the finest ornaments for a wall or trellis that our gardens can boast." It demands no peculiarity of management: if the roots be left in the open ground during winter, it must be covered over as a protection against frost.—*Botanist.*

PASSIFLORA MIDDLETONIANA. Mr. Middleton's Passion-flower. Passifloráceæ. Monadélphia Pentándria. (*Stove Climber.*)—The merit of introducing this plant is due to H. Middleton, Esq., who collected seeds of it and many other plants in South America or the West Indies (it being uncertain from which of these countries the present species was derived), and presented them to Mrs. Beckford, late of the Firs, Mitcham, by whose gardener, Mr. Swabey, they were raised five or six years back, and blossomed about 1838. One of the seedling plants was given to Mr. Upright, gr. to G. S. Ridge, Esq. of Morden, in one of whose forcing-houses it blossomed in fine pefection throughout the summer of 1841. Mr. Swabey says that the plant first blossomed in a pot, in the hothouse, and was subsequently planted out in the conservatory, where it did not succeed so well as in the moderate stove heat. A temperature between that of the greenhouse and the stove, with a somewhat close atmosphere, would seem to be the most appropriate; and if kept in a pot, it should be one of large dimensions. Planting it in a border or a prepared bed of a warm conservatory would most likely be preferable: or a similar situation in a cool stove is equally good. The species is of a luxuriant habitude, with strong stems, handsome dark-green shining foliage; and it bears a considerable number of its odorous blossoms. The calyx segments are pale green with numberless little pinkish dots on the inside. At a short distance the spots are not perceptible, and the surface appears entirely pink. The petals are narrower, with a whitish ground and similar spottings. The nectary or crown consists of two rows of beautiful purple and white filaments, and is particularly showy. It is grown in Messrs. Marnock and Manley's Nursery, under the name of P. fragrans.—*Paxton's Magazine of Botany.*

HIBISCUS CAMERONI. Mr. Cameron's Hibiscus. Malváceæ. Monadélphia Polyándria. (*Stove Shrub.*)—Mr. Cameron, the Curator of the Birmingham Botanic Garden, whose name this beautiful plant bears, had the good fortune to rear it from seeds sent from Madagascar by the Missionaries. It is a remarkably well-defined species, whether the leaves, the involucre, the calyx, or the corolla are considered. It flowers readily and for a long period during the summer; and in that season flourishes in the greenhouse: but in the winter it is best kept in the stove. Hitherto it has not produced seed, but it is increased by cuttings; and a young plant thus raised, presented to the Royal Gardens of Kew, soon produced its lovely blossoms, which are of a cream colour, tinged with rather deep rose, and with a rich purple spot near the bottom.—*Botanical Magazine.*

MISCELLANEOUS.

A Simple Means of Preventing the Failure of the Potato Crop.—It will be allowed by all practical farmers, that the Potato sets, when cut, discharge a large quantity of fluid or juice, the loss of which has a tendency to weaken the germinating powers of the sets, and at the same time exposes them to undergo fermentation in the heap. In 1833, we had our seed Potatoes from the parish of Pennycuick. When cut, I desired the women to riddle a shovelful of hot lime on every basketful of new-cut sets. They were turned over and over again, until the lime was taken up by the sets, when they were put into a heap three or four feet thick, where I have kept them for two or three weeks. The hot lime had the effect of stopping the flow of the juice, and of encrusting a strong skin on the sets. This crust, on the one hand, preserves the sap being drawn away from the sets in a dry season, among dry soil, and of repelling wet in a wet season, among damp earth. The sorts of Potatoes experimented on were dons and blues. The land was in a fine moist state, well worked, and the dung well made; and they were ridged in the last week of April. There was a regular braird, and the crop was fine. In 1834, our seed Potatoes, dons and blues, were obtained from the same parish, and treated in the same manner. The ground was very dry, the dung dry, and the heat great when they were planted: so dry, that the dust was flying from the strong clay soil, when drilled up. The braird was regular, and the crop fine, with the exception of eleven drills, which were planted without the sets being limed, and which proved a complete failure, and of some oxnobles which had also failed. In 1835 we did not change our seed Potato. One half of the land was dunged on the stubble in October, and the other half in spring, part of it on strong clay, and part on light loam. The dung was very dry in spring, the land not well worked, and the planting finished in May. The braird was regular, and the crop fine, although there was a general failure throughout the country. In 1836, the seed Potato was obtained from the neighbourhood of Edinburgh. They were buffs, and treated in the same manner as described above. The land, a fine dry, light soil, was in oat stubble after old grass, and full of wire-worm. The dung was very dry, the land well worked, the braird regular, and the crop fine.—There was none planted without the lime this season. In 1837, the seed Potato was obtained from Leader Water, dons and blues. A fine, light loam was well worked, and dunged with well-made dung. The crop was planted in the second week in May, and proved a fine one. No one planted without the lime this season. In 1838, the seed Potatoes came from Gala Water, dons and blues, which were planted in the last week of May, on land not well worked, and the dung very dry; but the braird was without a blank, and the crop fine. Two bolls of seed Potatoes from Peeblesshire were tried without lime, and proved a complete failure, the insects having eaten the sets to a shell. These were planted in the first week of May. In 1839, the seed Potatoes were from Gala Water, buffs, and which were planted in the last week of April, in strong clay soil, not well worked, and the dung very dry; but the braird was very regular, and the crop fine. There were none planted without lime this season. In 1840, again, the seed Potatoes were from Gala Water, dons and blues, which were planted in the end of May, in a light loam, full of wire-worm, but well worked, and the dung very dry. The crop was fine. A few drills were tried, as an experiment, without the lime, and they were so complete a failure that they were ploughed down.—*Transactions of the Highland Society of Scotland.*

Classical Fruit.—At a recent meeting of the Ashmolean Society, the Rev. R. Hussey exhibited some preserved fruit from the neighbourhood of Odessa, supposed to correspond with that mentioned by Herodotus as the produce of that district in his time; cf. Lib. IV. c. 23. Herodotus says, in speaking of the Argippæi, "that they subsist upon the fruit of a tree called Ponticum. It is about the size of a Fig-tree, and the fruit as large as a Bean, with a hard kernel. When the fruit is ripe, they squeeze the juice through a cloth, and drink it either alone or mixed with milk. It is dark-coloured, and thick, and their name for it is ἄσχυ. The pulp which remains is formed into cakes, which are likewise an article of subsistence." The preserved fruit has much the flavour of the Tamarind, without its peculiar sharpness, and the kernel is hard, resembling in substance that of a Date. The modern name for it is Kizil, and it is used in the present day exactly in the manner which Herodotus describes. Dr. Trithen, who procured the fruit from Odessa, described the tree as a branching shrub, not unlike a Gooseberry-bush, but he was not acquainted with its botanical name. [What a pity it is that gentlemen so learned in languages should not be acquainted with Natural History! This fruit loses all its interest because we are not told what it is—something it must be that is well known, but it is impossible to ascertain what from the imperfect description given of it. Probably it is either Zizyphus vulgaris, the Jujube, or Elæagnus orientalis, the Oleaster.]

Mr. Lambert's Botanical Library.—On Monday next commences the sale of Mr. Lambert's books. It is a long time since so many fine works have been brought to the hammer; and we presume there will be great competition for some of the lots, of which there are nearly 700. Among the more remarkable subjects are the following:—the author's Monograph of the Genus Pinus, two very fine copies in 3 vols. folio; the first six volumes of Sibthorp's Flora Græca; a presentation copy of Catesby's Carolina, in excellent condition; Sloane's Natural History of Jamaica; the unpublished plates of the Flora Peruviana; complete sets of the Botanical Register and Botanical Magazine; Blume's Flora Javæ, a coloured copy in 3 vols. folio; most of Jacquin's splendid works; Llave and Lexarza's Account of Mexican Plants, a work of extreme rarity; most of Humboldt's costly works; Martius' Palms; Plumier's work on West Indian Plants, in 5 vols. folio, extremely rare. We shall watch the progress of this sale with no common interest.

The Sunflower.—The proper season for sowing must in a great measure be regulated by circumstances; but the earlier the seed can be got into the ground the better, say the beginning of April, as the crops will be ripe and ready to harvest the latter part of August, which will be of the greatest importance to the grower. The necessary quantity of seeds required for an acre depends upon the condition of the soil, and varies from 4 lbs. to 5 lbs.; but of course it is advisable to sow a little more than is actually wanted, to provide against any unforeseen accidents which may happen to the seeds before germination. The seed should be drilled into the ground, and the distance from row to row 18 inches, and the plants to be thinned out to 36 inches from plant to plant; and the number of plants at this distance would be about 14,500 per acre; at 18 inches from plant to plant, 25,000 per acre; and at 12 in. from plant to plant, 32,000. The produce of this kind of grain, like that of most others, varies considerably according to the state of the soil, climate, and the cultivation that is employed; but the average quantity of seed is about 50 bushels per acre; 50 bushels of seed produce 50 gallons of oil; and the refuse, after the oil has been extracted, made into oil-cake, produces 1,500 lbs.; and the stalks when burnt for alkali give 10 cwt. of potash, besides paper, hemp, and other useful articles. The green leaves of the Sunflower, when dried and bruised into powder, form excellent fodder for all kinds of cattle, particularly milch cows, as it may be given them to great advantage by mixing the powder with chaff or bran.—*Mark Lane Express.*

Madia sativa.—There lately appeared in one of the French journals a paper by M. Boussingault upon the culture of the Madia sativa (an oleaginous plant in some repute in this country a few years since, but which from unsuccessful cultivation has been neglected), in which he endeavours to account for the results which have been obtained by different cultivators. The Madia undoubtedly possesses many advantages over other oleaginous plants, its oil being both of a superior quality and a more agreeable flavour. The results obtained in the two last years of cultivation are as follows: On the 22d April, 1840, the Madia, mixed with Carrot-seed, was sown on a piece of land which had previously received 54,000 kilograms of farm-yard manure. The same quantity of ground was dressed in like manner for Beet and Potatoes. The Madia produced this year 289 kilog. of oil, the net value of which was 323 francs 28 cents. After all the expenses incident upon the culture of each, the average value of the Madia was as 99, of the Potatoes 52, and of the Beetroot 34. After the land was cleared of the above crops, Oats were sown upon the ground where Beet had grown the preceding season, and upon that before occupied by the Madia mixed with Carrots. The produce of the latter piece compared with the former was as 46 to 41. So advantageous a result as that of 1840, says M. Boussingault, was sufficient to encourage us in increasing the cultivation of the Madia sativa, which was done, as will be hereafter seen, to our great loss and disadvantage. In 1841, the land having been manured in the same manner as in the preceding year, the quantity of oil extracted from the Madia was little more than 97 kilogs., the net value of which was 156 francs 40 centimes. In 1841 the Madia came to perfection in 122 days; the year before it occupied the ground, 127; the difference in point of time was therefore trifling. The mean temperature of 1840 during those 127 days was 17 deg. 2 min. Réaumur; that of 1841 was 17 deg. 6 min.; therefore the failure cannot be attributed to a cooler season, but to the abundance of rain which fell during the latter year, being double the quantity of the year preceding. Owing to the different results which have been obtained in these two attempts to cultivate the Madia, it is rather difficult to decide whether it is worthy of cultivation or not. In order to know how much dependence may be placed on the climate of France, we find, upon examining the valuable observations made at Strasburg by Professor Herrenschneider, that during 17 years there were only three, (1813, 1816, and 1824,) in which the quantity of rain which fell during the months of May, June, July, and August came at all near that which fell during the same months in 1841. M. Boussingault therefore concludes, that, admitting the failure of 1841 to have been caused by the abundant rains, he sees no reason why in average seasons the Madia sativa might not be profitably cultivated in the eastern districts of France.

Manure among the Chinese.—In arranging the various classes of the people, the Chinese place the literati in the foremost rank, as learning is with them the stepping-stone to honour; but immediately after the learned, the husbandman takes the precedence of all others, because being engaged in raising the necessaries of life, he is abundantly more important than the mechanic, who merely changes the forms of matter—and the merchant, who originates nothing, and only barters and exchanges commodities for the sake of gain. This honour put upon agricultural employments is evidently the result of design, and shows that the country, being overstocked with inhabitants, needs cultivating to its utmost extent, in order to provide the people with sustenance. The industry and skill of the Chinese, striving to produce as many of the necessaries of life as possible, would also argue a dense population, ever struggling against threatening want, and compelled to exert themselves for their daily bread. In tropical climates, where the ground is fertile and the population scanty, the natives find that, by a few months' labour, they can produce sufficient food for a whole year's consumption, and are therefore indisposed to exert themselves further. But in China, the inhabitants are incessantly employed, and every individual is obliged to be busy in contributing his quota to the common weal. Every one in the least acquainted with the manners of the Chinese knows that they are untiring in their exertions to maintain themselves and families. In the business of agriculture, they are more particularly active, raising two crops from the ground every year, extending their cultivation in every possible direction, and bringing the most unpromising spots into use, in order that nothing may be lost. Their skill in effecting these objects is not, considering their few advantages, contemptible. They thoroughly understand the importance of varying the crops; they know perfectly well the seasons and soils adapted for certain productions; and they are fully sensible of the importance of manuring the ground, in order to maintain its fertility. A stranger is struck with this on first setting his foot on the shores of China. Almost every individual met with in the paths and fields is provided with a basket and rake; and every evening the cottager brings home a certain quantity to add to the dung heap, which is a most important appendage to every dwelling. Having but few sheep and cattle, they are obliged to make the most of the stercoraceous stock of men and swine. This is carefully collected, and actually sold at so much per pound; while whole strings of city scavengers may be seen cheerily posting into the country every successive morning with their envied acquisitions; little heeding the olfactory nerves of the less interested passengers. Every other substance likely to answer the end is anxiously collected, and carefully disposed so as to provide for future exigencies; such as decayed animal and vegetable matter, the sweeping of streets, the mud of canals, burnt bones, lime; and, what is not a little singular, the short stumpy human hair, shaven from millions of heads, every ten days, is industriously gathered up, and sold for manure throughout the empire. In the high importance placed on stercoration, in China, we see an illustration of that passage in II. Kings, vi. 25, that when there was a great famine in Samaria, "the fourth part of a cab of dove's dung was sold for five pieces of silver."—*Madras Almanac for* 1841.

GARDEN MEMORANDA.

Royal Gardens, Claremont.—The pleasure-grounds which surround the mansion are very extensive and richly varied; before the south front there is a beautiful lawn where the mount rises, which has given the name of Claremont to the estate. The castellated building or tower which is built on this eminence commands an extensive prospect over a great portion of Surrey; the visitor has also a good view of Windsor Castle from other parts of the grounds. There is a pretty conservatory standing on the higher parts of the pleasure-grounds, which contains some fine specimens of greenhouse plants in excellent order. Those more particularly deserving of notice are Magnolia fuscata, highly valued on account of the delightful fragrance of its flowers; Acacia pubescens, armata; Banksia grandis and serrata; some of the finer varieties of Camellia, Kennedyas, Azaleas, Oranges, &c. At a little distance from the conservatory the stranger comes upon a very elegant Gothic building, which is particularly worthy of notice; it stands upon an artificial mount, and was originally designed by the Princess Charlotte for an alcove or open seat, but being unfinished at her death, it has been converted into a mausoleum to her memory. In the front of it in what is called her garden, there are two fine specimens of Cunninghamia sinensis, which were planted in 1816, and are now from 16 to 18 feet in height. They are perfectly hardy at Claremont, and have a very striking and ornamental appearance. Passing onwards through a finely-varied succession of lawns and shrubberies, a circular lake, having a luxuriantly wooded islet in its centre, interspersed with trees, is agreeably presented to the view; and the broad margin of turf which is surrounded with lofty trees and plantations, forming a beautiful glade or amphitheatre, gives an air of grandeur and retirement to the whole. In the months of May or June, when the Rhododendrons are in flower, which are here of great size and in the most luxuriant health, the whole scene must resemble some enchanted fairy land. In various situations in the grounds the following trees are conspicuous for their large size:—Juniperus virginiana, Abies canadensis and Picea, Pinus Cembra, P. Pinaster, Cedar of Lebanon, Quercus Phellos var. latifolia, Quercus Suber, Tulip-tree, Purple Beech, Deciduous Cypress, and many others. The Laurels forming the underwood in the plantations are particularly striking and fine, and must make the walks pleasant even in the midst of winter. The flower and kitchen gardens are at some distance northward of the mansion; the walls, which are of great solidity, were built by Sir John Vanbrugh, and enclose between seven and eight acres besides the slips. The forcing department consists of three vineries, two fruiting Pine-pits, two stoves, an Orchidaceous house, greenhouses, and various other pits and frames. The Muscat of Alexandria Grape is the kind which is chiefly grown here; the berries in the first house have just been thinned; both houses look extremely well, and promise fine crops. In one of the houses we observed some excellent Strawberries. One of the fruiting Pine-pits contains Ripley Queens, just out of bloom; the other is filled with the black varieties, for a succession. Both these and the others in the succession-pits are in excellent order, and very promising. In the stove are fine specimens of Cycas, Screw Pine, and many other plants, all in the best condition. The greenhouse was quite gay with flowers, among which were some fine varieties of Azalea indica. Sir John Vanbrugh sold the estate to Sir Tho. Holles Pelham, afterwards Duke of Newcastle, who made considerable additions to it, and enlarged the house and park, under the superintendence of Kent, the landscape-gardener. After the Duke's decease the estate was purchased by Lord Clive, who, when setting out on his last voyage to India, gave instructions to Brown, another celebrated landscape-gardener, after pulling down the old house to build a new one, and remodel the grounds. The undulated nature of the park and the judicious grouping of the trees produce the finest effect, and form an excellent study either for the young gardener or for the gentleman who is anxious to improve his park. Nature has done much for Claremont, and with the assistance of the best landscape-gardeners of the last century, it is now, indeed, a regal place, worthy of the favour and patronage of our gracious Sovereign, and of his Majesty Leopold, King of Belgium, to whom it belongs.—*R. F.*

Reviews.

A Dictionary of Science, Literature, and Art; comprising the History, Description, and Scientific Principles of every branch of Human Knowledge; with the Derivation and Definition of all the Terms in general use. Edited by W. T. Brande, and others. London: Longmans. 8vo. Parts I. to XI.

Although not very closely connected with the subjects considered in our columns, we nevertheless may be permitted to bring this book before our readers for the sake of its great utility to those who are interested in works on science.

One of the greatest difficulties which a general reader finds in understanding discussions upon technical subjects, however earnest the desire of the writers may have been to avoid "hard words," consists in his unacquaintance with common terms of science, for which ordinary language has no equivalent, and which therefore cannot possibly be dispensed with. In botany it is in vain to endeavour to avoid such words as stamen and pistil, ovary, ovule, and placenta; in vegetable physiology we must speak of stomates and epidermis, and the many forms of tissue, of tracheæ or spiral vessels, of parenchyma, alburnum, and the like. In the same manner the architect must introduce his voussoirs, epistyles, soffits, architraves, and intrados; the physician talks of strabismus, hepatic affections, and syncope; the lawyer cannot dispense with flotsam and jetsam, demise, distringas, and socage; the soldier must employ his gabions and fascines, curtains, parapets, and ravelins; and so of all the rest. Now where is a common man to find the meaning of such words? not in dictionaries most assuredly: it is only in encyclopædias that they are to be looked for. But the mass of readers have no access to encyclopædias, which are far too expensive for their means. It was, therefore, a happy thought which led to the production of the work before us, concerning which we can state that it fulfils the conditions required by its readers. The definitions are as brief as is consistent with accuracy, and the longer articles manifest great skill in the difficult art of condensing matter; added to which, a small but beautifully clear type has enabled the publishers to compress an enormous quantity of matter into the twelve or thirteen hundred pages of which the volume will consist when finished. We have taken the trouble to calculate what proportion the matter contained in the work bears to common octavos; and we find that the Dictionary of Science when complete will include as much matter as will be found in nineteen volumes of works like Liebig's Organic Chemistry, a book by no means loosely printed.

We select Starch as a specimen of the manner in which the work is written.

"STARCH. (Germ. stärke.) Starch is one of the commonest proximate principles of vegetables. It is characterised by its insipidity, and by insolubility in cold water, in alcohol, and in ether. It dissolves in, or at least forms a gelatinous compound with water, heated to 175°; and this solution, even when much diluted, is rendered blue by iodine. This admirable test of the presence of starch is not effective in hot solutions; and by boiling the blue colour disappears, but returns in strong solutions as they cool. The term starch is commercially applied to that obtained from wheat, which for this manufacture is ground and diffused through vats of water, where it undergoes a slight fermentation, and acquires a peculiar sour smell. A part of the gluten and albumen of the grain is thus separated in the form of a viscid scum; the starch being in the form of a finely-divided white powder, is gradually further separated by washing in large quantities of water, from which it is ultimately allowed to settle, and put into boxes lined with linen to drain; it is then cut into squares, which are dried first in airy chambers upon porous bricks, and afterwards rolled up in papers and stove-dried; it is in this latter operation that the starch acquires that peculiar columnar texture and fracture which is well exhibited on opening a paper parcel as it comes from the stove. A little smalt is generally added to the starch, by which it acquires a very pale blue tint, and is better adapted to conceal or cover the yellow tint acquired by worn linen. Starch may be obtained from many other grains, and from potatoes and several other esculent vegetables. Arrow-root is the starch of the Maranta arundinacea; sago, of the Sagus farinifera, an East Indian palm-tree; and tapioca and cassava of the Jatropha Manihot. Viewed under the microscope, the varieties of starch exhibit a more or less distinct globular appearance, and are said to be made up of little spherical particles of soluble starch, enveloped in an insoluble membrane, which protects the interior from the action of cold water, but which is broken or burst by hot water. In the process of germination, and by various chemical agents, starch may be converted into a species of gum and of sugar."

"Starch is charged with a duty of 3¼*d.* per lb.; and its manufacture is, consequently, placed under the control of the excise. Every maker of starch for sale must take out an annual licence, which costs 5*l*. Notice must be given to the excise of the erection, and of all changes in the construction of workshops, implements, &c. used in the manufacture of starch, under a penalty of 200*l*. All starch, before it is put into any stove or place to dry, must be papered and sealed, or stamped by the officer, under a penalty of 100*l*. Any person forging or counterfeiting such stamp or seal is guilty of felony, but with the benefit of clergy. Any person knowingly selling any starch with a forged or counterfeit stamp, &c. forfeits 500*l*. No quantity of starch exceeding 28 lbs. to be removed from one place to another, unless the word starch be marked on the package in legible letters three inches long, under forfeiture of the package, and of the cattle and carts conveying the same. Any dealer in starch receiving any quantity exceeding 28 lbs. not marked as above, shall forfeit 200. Starch-makers are to make weekly entries of the starch made by them, under a penalty of 50*l*.; and are to make payment of the duties within a week of such entry. Cockets granted for shipping starch to be carried coastwise are to express the quality, quantity, weight, the mark of the package, by whom made and sold, and to whom consigned; and if shipped without such cocket, it may be seized. No starch is to be imported, unless in packages containing at least 224 lbs. stowed openly in the hold, on pain of forfeiture, and of incurring a penalty of 50*l*. No starch is to be exported, unless the packages as originally sealed or stamped by the officer be entire, and unless the officer mark the word *exportation* upon it. The duties must have been paid on all starch exported; but the exporter is entitled to an excise drawback of 3½*d*. per lb. (*Burn's Justice of the Peace*, Marriott's ed., tit. Starch.)"

After this need we add that such a book, so full of the most useful kind of information, is one which is, of all others, the most worth having by those who read anything better than novels?

The History and Management of Bees, with Notice of a Newly-constructed Hive. By John Wighton, Gardener to Lord Stafford. Longman, London; Bacon, Norwich. Small 8vo.

As every good gardener is now expected to know something of the management of bees, a treatise on the subject, apparently the result of experience and careful observation, cannot be without its interest.

Of the work before us, the earlier chapters are devoted to a slight description of the Honey Bee, the construction of cells, on wax, propolis, Bee bread, the Queen Bee, the use of the cells, the swarming, and the situation in which hives should be kept. The chapter on the establishment of an apiary is one which will be looked to with much interest; the following is the author's advice on the method of choosing stocks:—"Place your ear close to the hive and give it a tap: if the inmates give a short and sudden buzz, all is right; but if it be a languid hum, or rather a purring sound, the hive must be rejected, for the bees are weak."

Mr. Wighton considers close Bee-houses objectionable, as harbouring injurious insects in summer, and being often too damp in winter. He recommends a shed, open at the sides, but with a roof low enough to shade the hives except the doorways in summer; in winter, when the sun is low, that object is effected by hanging a mat in front.

With regard to hives, the author has adopted one like those used in Poland, but improved by himself. He gives a figure of it as a frontispiece, and the following is his own description:—"The distinguishing feature of this hive is its simplicity; its approach, in fact, to the habitations which the Bees instinctively choose for themselves. It consists of the root-end of a Spruce Fir, nine feet long and three feet nine inches in circumference, from which the centre wood is hollowed out, and the planks removed for that purpose are sawn off to within three feet of the bottom. One of these is nailed on again at the back: the other being divided, fits into its place again as an upper and lower door. The interior, seven inches square, is separated by a slide into two compartments, the roof of each being provided with four slips of wood nailed north and south for the Bees to fix their coombs upon. By reducing the cavity, the heat is increased within, which enables the Bees to get on faster with their cells; also in winter they can be kept in one division, and they always choose the upper. In taking away the honey, if the operator be afraid of the Bees, he can force them with a little smoke from brown paper into one division: then putting in the slide, he will have it all his own way. I have found it useful also when replacing swarms. For example, this season I replaced the first swarm in the upper division, having previously divided the hive with the slide. The brood queens were below. The old queen and swarm settled, and after two more swarms had come off, I allowed the Bees to mingle together, and they went on in peace as if nothing had happened. It was curious to hear the young queens calling and the old one so near them. In the lower division there are two entrances, one at the bottom and the other at the top, made with an auger, having a slip of wood on the inside to keep out the mice; in the upper part there is but one, which is in the centre. They are of course made on the opposite side to the doors; the space out of which these last were sawed, being first filled up through its whole length by two glasses fixed into a moveable frame, gives the apiarian ample means of observing the proceedings of his Bees; while, when the doors are closed over it, the Bees are shielded from the light and from changes of temperature. The block-end of the hive is sunk two feet and a half into the earth to keep it firmly upright, and the top is closed with zinc, and surmounted by a block of wood."

In the chapter on feeding Bees, the author remarks that if this point was more attended to, failures would not so frequently occur. He advises the Bee-keeper to feed Bees during March and April when the weather is wet and cold, and our own experience entirely coincides with that of Mr. Wighton. The last chapter contains some remarks on the decline of Bee-keeping, which is attributed to these causes:—"1st. The remarkable fact that for several years past we have had long cold springs. 2d. That many tracts of waste land having been brought under cultivation has sensibly diminished the favourite wild flowers of the bees. 3rd. The quantity of foreign honey imported, which has lessened the demand for native produce. And 4th. The lower price which this circumstance has caused to be offered."

He then points out in what manner these may be remedied by apiarian societies, and shows the advantages of Bee-keeping to cottagers.

Of *The Book of the Farm*, Part IV. is before us. It is illustrated by two well-executed plates of animals and eleven woodcuts, and contains some excellent articles, upon most important practical matters—such as soils and subsoils, climate, inclosures, and planting Thorn hedges. We select the following observations upon soil, and the means of performing a mechanical analysis of it:—

"Soil, considered scientifically, may be described to be essentially a mixture of an impalpable powder, with a greater or smaller quantity of visible particles of all sizes and shapes. Careful examination will prove to us, that although the visible particles have several indirect effects, of so great importance that they are absolutely necessary to soil, still the impalpable powder is the only portion which directly exerts any influence upon vegetation. This impalpable powder consists of two distinct classes of substances, viz. inorganic or mineral matters, and animal and vegetable substances, in all the various stages of decomposition.

"A very simple method may be employed to separate these two classes of particles from each other, viz. the impalpable powder and the visible particles; and, in so doing, we obtain a very useful index to the real value of the soil. Indeed, all soils, except stiff clays, can be discriminated in this manner. The greater the proportion of the impalpable matter, the greater, *cæteris paribus*, will be the fertility of the soil.

"To effect this separation, the following easy experiment may be performed:—Take a glass-tube about two feet long, closed at one end; fill it about half full of water, and shake it into a sufficient quantity of the soil to be examined, to fill the tube about two inches from the bottom; then put in a cork, and, having shaken the tube well to mix the earth and water thoroughly, set the tube in an upright position, for the soil to settle down. Now, as the larger particles are of course the heavier, they fall first, and form the undermost layer of the deposite, and so on in regular gradation, the impalpable powder being the last to subside, and hence occupying the uppermost portion. Then by examining the relative thickness of the various layers, and calculating their proportions, you can make a very accurate mechanical analysis of the soil."

A Compendium of the Veterinary Art, &c. By James White. Seventeenth Edition. By W. C. Spooner. 8vo. Longmans.

When a work has passed through sixteen editions it is superfluous to offer an opinion upon its value, for such a sale is the best guarantee to the public that the book answers the expectations of buyers. We have, therefore, only to state that the three volumes of former editions are here combined in one, that much unimportant matter has been omitted to make room for new additions, that the original text has been in several cases re-written, and that this, the seventeenth edition, is in many respects a new work. It is illustrated by 56 excellent woodcuts, by Branston.

Baxter's British Flowering Plants—a work, with plates of all the genera, appearing monthly, and extremely useful to those who study wild plants—has now reached its 117th Number, and will soon be completed. The last Number contains Eriocaulon, Asperugo, Borkhausia, and Trinia.

The Florist's and Amateur's Guide. By J. Wakeling.—We noticed the earlier numbers of this work (p. 648 of 1841), and the favourable terms in which it was mentioned apply equally to the later numbers. The plates are the best representations of florists' flowers we have seen; they are well drawn and well coloured. The Auricula (Dickson's Unique) and the Dahlias (Bragg's Great Western and Spary's Conqueror of the Plain) corroborate our assertion. We fully enter into the feelings of Dr. Horner, in his letter to the author, "that Mr. Wakeling deserves well of the florist for having brought forward so opportune a work."

CALENDAR OF OPERATIONS *for the ensuing week.*

The subjoined directions for the summer management of Vines under glass will answer "A Constant Reader's" questions upon that subject, and possibly be of some service to other readers of the *Gardeners' Chronicle* who may not have had much experience in this matter; and for this reason, although late in the season, it is necessary to commence at the beginning. Whatever method of training might be adopted, whether the long-rod system, or the spur system, or any of their various modifications, it is always essential to obtain sound and mature bearing-wood; and this can only be done by proper summer management. When, therefore, the buds begin to push, select a sufficient number of the best-placed fruitful shoots, and destroy all that are not wanted. As the shoots advance in growth, pinch off all laterals below the bunches as soon as they appear; this prevents the lower portion of the shoots from becoming a tangled mass of confusion in their after-growth, and permits the proper leaves to receive a due share of light, without which the buds at thei base, destined to produce fruit the following year, cannot be perfectly formed. The reason usually assigned for retaining these laterals is, to furnish an outlet for superabundant sap, and thereby prevent the next year's buds from breaking prematurely; but of this there is no fear, so long as the laterals above the bunch are not taken away. Destroy all tendrils, and pinch off the end of the growing shoot one clear joint beyond the embryo bunch; after a time a shoot will push from the uppermost bud, and a lateral from the joint at which the fruit is situated, both of which should be stopped when they have made one leaf, and afterwards the weak shoots that spring from these may be pinched close off, or permitted to extend a joint further when the Vines are growing vigorously. There will thus be two well-developed leaves—one at and one beyond the bunch; and whatever theorists may say, experience has proved in a thousand instances that these (assisted, perhaps, in some degree by the smaller ones on the stopped laterals) are competent to manufacture plenty of food for a bunch of Grapes two or three pounds in weight. When the fruit begins to change colour, all laterals that obstruct the light should be cut off; but by no means destroy the principal leaves, for so long as these retain their green colour they continue to perform their functions of assimilating and depositing nutritive matter within the vessels of the wood. The foregoing instructions apply to fruit-bearing shoots which are meant to be cut back to two or three eyes at the next winter pruning. When the long-rod method is followed, the shoots for next year's bearing must not be stopped till they reach the point to which it is intended to shorten them when pruned; afterwards they may be allowed to extend as far as there is room. With respect to the proper quantity of fruit to be retained, no precise rule can be given, because the weight of the crop should depend upon the strength of the plants, but it is always better to under than to over-crop. One bunch upon each shoot will generally be sufficient; however, we would keep two bunches upon strong shoots in preference to crowding the latter one over the other in a confused manner.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Any late-potted plants that have not yet formed new roots had better be shaded in bright sunshine; such weather will also make a more liberal supply of water necessary, especially to growing plants. Close the houses while the sun shines strongly upon them, and at the same time fill them with vapour by lightly sprinkling the plants, and flooding the paths with water. A temperature of 55° in the morning will be high enough for the general stock; but plants that are in fruit, or wanted to fruit, should be kept 5 or 7 degrees warmer.

Vinery.—The late houses demand particular attention, as not only the present but the succeeding year's crop is in a great measure dependent upon their judicious management when the wood is forming. Try to proportion the moisture in the atmosphere to its temperature; when very warm, and especially if no air is given, wet the floor of the house frequently; when cool, keep it comparatively dry. Be cautious in admitting air while cutting winds prevail.

Peach-house.—In the second house (commenced in January) the stones will now be about forming; very regular management will therefore be necessary. As this is a process which requires time (generally from three to four weeks, according to the season) for its completion, it will be dangerous to attempt to hasten it; consequently, all undue excitement should be avoided. The night temperature may range from 55° to 60°, and air ought to be given when the sun has increased the heat 8 or 10 degrees. Cold water should not be used, either for washing the foliage or for watering the roots.

Cherry-house.—As the fruit approaches maturity, gradually diminish the supply of water, and let it have air whenever practicable, and all the light possible. Use means, also, to free the leaves from insects, if any exist, or the fruit will be much deteriorated.

Fig-house.—See that the watering of the borders be not neglected, or the loss of the crop will most likely be the consequence. The broad leaves of the Fig perspire an immense quantity of moisture in bright sunshine; therefore the roots will require a corresponding supply.

Strawberries.—The latest plants intended for forcing should now be brought forward. Moisten the leaves occasionally till the blossoms expand, but these must never be wetted. Take care that the plants are quite free from aphides before the fruit ripens; they cannot be fumigated afterwards.

Cucumbers and Melons need particular attention in such weather as we have lately had. It is better to partially shade the plants, and keep the frames close, than to permit very cold winds to blow directly upon them. Examine and protect the linings, that they may not be suddenly chilled. Sow some hardy sorts of Cucumbers for ridges; likewise Gourds and Vegetable Marrows. All these will more readily accommodate themselves to the climate of the hand-glasses when ridged out, if they are not brought up too tenderly.

Out-door Department.

Broccoli.—As the heads form, they should be sheltered from sun and frost by turning the leaves over them; or the plants may be taken up with balls and stored in a cool shed. Protect the young seedlings against Chaffinches.

Cauliflowers.—Those under hand-glasses should be uncovered every fine day. As they advance in growth, elevate the glasses on bricks, and earth up the plants.

Oxalis Deppei is said (see Vol. I., p. 68) to be a valuable addition to our esculent plants. This is the time recommended for planting the bulbs, which are stated to thrive best in light sandy soil enriched with decayed vegetable matter. Plant the bulbs singly, four or five inches distant from each other, and one inch deep, in rows.

Peas.—Earth up and stick as necessary. If cold weather should continue, a few Fir branches stuck between the rows of the earliest crop will in some degree screen them from the wind.

Potatoes.—Lose no time in planting the main crop.

Orchard.—The principal business in this department now is properly attending the wall-trees. Disbudding may be commenced upon any Peach and Nectarine trees that are forward enough; it is a bad practice, however, to reduce the shoots much at one time. The coverings of Fig-trees should be diminished, but not wholly removed.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Take care that plants with large broad leaves do not flag for want of water; give manure-water to such plants as Musas, Hibiscus, &c. Give air with caution so long as cold north-east winds continue. The young shoots must now be trained carefully into the desired form, for much of the beauty of creepers particularly will depend upon this being attended to.

Greenhouse and Conservatory.—In this cold windy weather, discretion is needed in opening the sashes of the house in which Pelargoniums, Calceolarias, Cinerarias, &c., are growing; air will be necessary, yet a current of chilling wind should be guarded against. Hard-wooded plants, being less delicate, must not be shut up too closely. The low-growing Cactaceous plants, such as Mammillaria, Melocactus, and similar genera, will require re-potting. If perfect drainage is secured, these thrive well in a more nutritive compost than is generally given them.

Pits and Frames.—Pot off rooted cuttings, always using small pots and light soil at first. Keep them close and rather warmer for a few days afterwards. Plants for the flower-garden should be kept dwarf and bushy by repeated stoppings. Annuals intended to flower in pots will not make large and showy plants if they are allowed to produce blossoms when young; Balsams especially should have the flower-buds removed.

Out-door Department.

Continue the protection of flower-pots to annuals that are just coming up in the flower-borders; they can be taken off in the day and replaced in the evening. Be careful, likewise, of choice Tulips, and other valuable bulbs. Prune Roses that have hitherto been left undone to induce late flowers. The shoots should be cut back to the buds near their base that are latest in breaking. In the reserve ground, sow seeds of perennial and biennial flowers, for transplanting.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Tender seedlings that are just appearing above ground might be screened from cold winds and frost by Fir branches; the beds must also be kept free from weeds. Oaks, Hollies, and many plants which are late in vegetating, may be grafted.

Forest and Coppice Woods.—As the season for felling Oak timber is now approaching, other work should be got out of hand as speedily as possible, that advantage may be taken of the first warm weather for this important business.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending April 14, 1842, as observed at the Horticultural Garden, Chiswick.

April		Barometer.		Thermometer.			Wind.	Rain.

The highest temperature during the above period occurred on the 24th, 1840—thermometer 75°; and the lowest on the 19th, 1838—thermometer 26°.

REPORT ON COVENT GARDEN MARKET,

For the week ending April 15, 1842.

The Market has been rather scantily supplied with Vegetables during the past week, owing to the continued cold winds. Most kinds of fruit are, however, plentiful; but trade has not been quite so brisk as last week.—*Fruit.* Pines are plentiful, not varying in price from our last Report. There are still a few Hothouse Grapes to be obtained. A few Peaches and Nectarines, which appeared to be tolerably good, were offered at 20*s.* per dozen. We likewise observed a small punnet of Cherries, for which 21*s.* were asked. Apples are rather increasing in price; good Nonpareils, fetch from 14*s.* to 30*s.* per bushel. Pears continue much the same. Strawberries are becoming more plentiful; those offered are generally of good quality. Cucumbers are tolerably plentiful, at a somewhat reduced price.—*Vegetables.* Broccoli is now becoming scarce, and the price of it is consequently raised. Kidney Beans are plentiful; the price of them still continues the same. New Potatoes remain much the same, fetching from 1*s.* 9*d.* to 2*s.* per lb. Asparagus is very good; the supply, however, is not abundant, and it has risen in price during the past week. Seakale is plentiful and excellent; it fetches from 1*s.* to 1*s.* 6*d.* per punnet. Plenty of Salading of all kinds may be obtained, and of a good quality. The supply of Rhubarb is fast increasing, not varying in price from our last account. Mushrooms may be had in tolerable quantity, but they are rather dearer than during the preceding week.

PRICES Saturday, April 16, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 7*s*
— Dessert, per bushel, 5*s* to 14*s*
Pears, dessert, per half-sieve, 5*s* to 24*s*
Strawberries, forced, per oz., 1*s* to 1*s* 3*d*
Peaches, per doz. 20*s*
Nectarines, per doz., 20*s*
Pine Apple, per lb. 8*s* to 12*s*
Grapes, hothouse, per pound, 15*s* to 20*s*
— Spanish, per lb., 1*s* to 2*s* 6*d*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s* 6*d*
— per 100, 4*s* to 16*s*
— Bitter, per 100, 6*s* to 20*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 5*s* to 16*s*
Cucumbers, per brace, 2*s* to 5*s*
Almonds, per peck, 7*s* to 8*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, per doz., 1*s* 3*d* to 1*s* 6*d*
Cabbage, Red, for pickling, 6*s*
Cabbage Plants, per doz., 6*s* to 7*s*
Broccoli, White, p. bnch., 1*s* 3*d* to 2*s* 6*d*
— Cape, 1*s* to 1*s* 3*d*
— Sprouts, per sieve, 1*s* 6*d* to 3*s*
Kidney Beans, forced, p. 100, 1*s* 6*d* to 2*s* 6*d*
Potatoes, per ton, 50*s* to 100*s*
— per cwt. 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 3*s*
— Kidney, per bush. 2*s* to 3*s*
— New, per pound, 1*s* 6*d* to 2*s*
Turnips, per dozen bunches, 2*s* to 2*s* 6*d*
Carrots, per doz. bunches, 6*s*
Parsneps, per dozen, 6*d* to 9*d*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 1*s* 3*d* to 1*s* 6*d*
— Turnip, per doz. bch., 3*s*
Chives, per pot, 6*d*
Leeks, per dozen bunches, 6*d* to 1*s*
Garlic, per lb. 8*d*
Shallots, per lb., 1*s*
Onions, per half sieve, 2*s* 6*d* to 3*s*
— for pick., per hf.-sieve, 2*s* to 2*s* 6*d*
— Green, per doz. bches., 2*s* to 2*s* 6*d*
— Spanish, per dozen, 1*s* 6*d* to 4*s*
Asparagus, per 100, large, 10*s* to 16*s*
— Second or Middling, 6*s* to 7*s*
— Sprue, or Small, 4*s* to 5*s* 6*d*
— Natural, 25*s*
Sea-kale, per punnet, 1*s* 6*d* to 2*s*
Lettuce, Cabbage, per score, 6*d* to 9*d*
Cos, per half sieve, 1*s* to 1*s* 6*d*
Endive, per score, 2*s* to 3*s*
Celery, per bundle (12 to 15) 9*d* to 1*s*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d* to 1*s*
Watercress, p. dz. small bunch. 7*d* to 8*d*
Parsley, per half sieve, 2*s* to 2*s* 6*d*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Sage, per doz. bunches, 3*s*
Mint, per dozen bunches, 4*s*
Basil, per bunch, 9*d* to 1*s*
Rhubarb Stalks, doz. bundles, 8*s* to 12*s*
Mushrooms, per pottle, 2*s* 6*d* to 3*s*

Notices to Correspondents.

Parties requiring copies of particular Numbers to make up their sets must order them through their regular news-agents, as we do not ourselves send copies direct from the office. This notice applies more directly to a subscriber at North Shields, but is equally applicable to all subscribers; and we would further recommend those who may have lost copies to complete their sets for this year at once, as we are nearly cut of print of most of the Numbers.

P. S. can have copies of Mr. Paxton's "Gardener's Calendar" for distribution.

A Correspondent says "the value of some Timber cut in the island of Trinidad is said to depend on the age of the moon, owing to its power of drawing up the sap; and practical planters there report great difference in its durability;" and he asks us if this is likely to be so or not? We think not. He then says, "As we do not grow Orange-trees in this country for the value of the fruit, but only for the sweetness of the blossom and the pretty evergreen foliage, why should they be grafted? What sort of Orange ought one to take the seed from, and at what time should we sow it?" We, nevertheless, advise him to buy grafted Orange-trees. In the first place, many sorts, as the Oranger de Nice, a fruit Charnu, multiflore, and Bigaradier multiflore are propagated because of their abundant flowering; and secondly, it will be so long before his seedlings flower at all that his patience will be worn out; or at least ours would be.

A Subscriber.—The seed of the Portugal Cabbage should be sown the last week in March. Want of space for the roots of your Vines to run in, is the cause of the leaves curling and becoming spotted. It is impossible for them to obtain sufficient nutriment from a border 1½ft. wide between two walls. To destroy the Coccus you must next winter peel the rough bark off your Vines, and brush the stems over with a thick mixture of flowers-of-sulphur and tobacco-water.

T. H. D.—The Portugal Cabbage requires the same treatment as the more common kinds, with this difference, that it must be sown sufficiently early to allow of its arriving at maturity before the autumnal frosts.

A Subscriber.—Nitrate of soda is used at the rate of 1 or 1½ cwt. per English acre. If Asparagus-beds are watered with salt and water as strong as sea-water, we should fear that Onions would suffer in consequence, but we are not certain. Wild Parsnep can only be destroyed by digging it up, or putting a large pinch of salt upon the wounded crown of the root.

W. D.—The reason why we recommend Asparagus to be watered only once with salt water, but then to be well soaked, is that we are ignorant of the quantity of salt this plant will bear, and of the quantity of salt in the sea on the coast of Guipuscoa. The proportion of salt in sea-water varies from less than 2 to nearly 4 per cent. in different places. The coarsest and most impure salt will be most fit for use. Give your beds as thorough a soaking as if they had been inundated.

Simon Trypatience.—When liquids effervesce on the addition of an acid, it is not because they contain ammonia, but because they contain carbonic acid or carbonates; a solution of caustic ammonia will not effervesce with any acid but a liquid containing carbonate of ammonia; soda, potash, or any carbonate, will effervesce, in consequence of the expulsion of the carbonic acid by the stronger acid. It is as well in adding acid to liquids containing ammonia for the purpose of fixing it, to add enough to expel all the carbonic acid of the carbonate of ammonia or any other carbonates present, as by so doing we are sure we add enough to fix the ammonia; when all the carbonate of ammonia present is converted into sulphate, no more effervescence can be occasioned by adding fresh acid; but if the solution is very weak, or contains very little carbonate of ammonia, the effervescence occasioned will be very trifling and hardly perceptible. The propriety of using such liquid alone, or diluted with water, will depend on its strength, no general rule can be yet given, but it is very desirable that experiments should be made with various strengths so as to discover the proportions proper to be used.

E.—Sulphate of Baryta is of no use whatever in fixing ammonia. Baryta has a more powerful affinity than any other substance for sulphuric acid; and hence neither ammonia nor any other base can decompose it. The effect of sulphate of baryta on plants is very little known, but is probably inconsiderable. It is perfectly insoluble in water, and, in consequence, has no action on animals, though all the other compounds of baryta are very poisonous.

Rusticus expectans.—The statement about Guano was given on the authority of Professor Johnston, who, no doubt, quotes wholesale prices. Salt cake, which is impure sulphate of soda, may be had cheap enough. You had better drill bone-dust soaked in gas-water with your Mangel-wurzel.

C. F. P. has a brick drain from his cow-yard and piggeries, which runs by the stables and receives the fluids from thence and elsewhere. Also the whole of the soap-suds and washings of the house, and contents of the closets in the house, are by this drain conveyed into a brick reservoir, about 12 or 15 feet deep: this reservoir is bricked over and has not been opened for the last six years. At a certain height in this reservoir there is an opening to allow the waste fluid to run off, and this, heretofore, has gone down a ditch and *has been lost!* He has now made an opening at the side of the ditch, sunk it about three feet to receive this superfluous liquid, and he wishes to ask whether we think this liquid is in a proper state to apply as a manure to the kitchen or flower garden? whether the soap-suds and washings from the back kitchen, brewery, &c., will not be sufficient (without its undergoing any chemical process) to render it a useful manure as soon as it runs down?—The fluid last mentioned is, doubtless, an active manure; but, if it smells, we should add powdered, not burnt, gypsum, until it ceases to be in any degree offensive. All the effluvium from the reservoir may be arrested if sulphuric acid enough, diluted with water, is added; by opening an aperture into the reservoir this agent may be introduced without poisoning the neighbourhood, and the contents of the reservoir will be twice as valuable.

N. D. H. R.—We advise you to examine the roots of your Lemon-trees; no doubt there is something wrong with them. You will either find them too dry, or the soil has got into a wet and sour condition. In either case remove the most of it, spread out the roots well, and add fresh soil. You may then prune them back; and if in tubs, remove them to a house which is kept warmer than the conservatory; if you cannot do this, they will probably recover where they are. The Camellia can be successfully inarched in the conservatory; although many persons do this in cold pits. We prefer inarching in the common way, where it can be done, to the inserting the end of the scion in a phial of water; but they succeed very well in the latter way. We fear you are too late for grafting Roses now; it is not worth while to do so with the Chinese and the varieties, as they strike so freely from cuttings. You will find various lists and descriptions of Coniferous plants by referring to our back Numbers. See pp. 340 and 564 (1841), and p. 52. The greater part of the Mexican kinds have not been long enough in the country to enable us to say whether they will prove hardy or not.

D. B.—We do not know what effect may be produced on plants by the refuse from pyroligneous acid works. Charcoal by itself would, no doubt, be advantageous to stiff land as a manure. We were not aware that the colour of blue Russian Violets changes to white at the end of the blooming season. Zinc would be applicable for lining a sink for washing purposes.

A Constant Reader.—Larch or any other timber, steeped in corrosive sublimate, gives out a vapour highly injurious to all plants that it comes into contact with. Several experiments that have been made in the Garden of the Horticultural Society have all led to the same result. See page 176 of the present volume.

H. G. K. B.—If you collect a large quantity of liquid manure, put it in tubs, and add powdered gypsum to it, it will be fit for use all the summer; but it is of no use to add sulphate of ammonia to it, because that will be ready formed in the mixture. Gypsum can be obtained of the drysalters or dealers in manure; the best to procure is the *unburnt*, broken or ground to powder.

J. S. S. S.—Your seedling Carnations are apparently dying from being placed in too damp an atmosphere. Your Tulips are, no doubt, too much drawn up from want of sufficient air, or some other cause; probably you cover them too much. Wakeling's "Florist's Guide" may be ordered of any bookseller.

X. X. X. will be fully answered next week.

W. D.'s maggots being dead, it is impossible to determine the genus to which they ought to be referred. They are probably the larvæ of some dipterous insect, and are in no way allied to the Raspberry-beetle, which we have not at present reared.—*R.*

A Countryman.—Victrix is Latin. There is no such word as Victress, except in your neighbour's vain imaginings.

A Subscriber.—We cannot tell what your plant is by the leaf sent, but it looks like Abútilon striatum.

G. W.'s flower is apparently Zephyranthes rósea.

J. S.—Platylóbium ovatum, Tweédia cærúlea, and Clématis azúrea would be considered proper greenhouse creepers at the shows of the Horticultural Society.

T. Rivers.—From the fragment sent, your Rose appears to be the Rosa rubifólia.

An Essex Subscriber.—The very handsome, somewhat pearmain-shaped Apple, with a broad shallow eye, is not known; but it well deserves cultivation.

A Constant Reader.—Sow your Prótea seed in a mixture of maiden loam, peat, and sand, taking care to drain the pots thoroughly. Cover the seed lightly, and plunge the pots in a hotbed. Your plants are—1, Andrómeda calycina; 2, Muscari comosum; 3, Aubrietia deltoídea.

John Goldie.—Pastel is the common Woad, or I'satis tinctória. Your plant is the Anemone quinquefólia of Linnæus, which is now regarded as a variety of A. nemorosa.

An Old Subscriber is answered in a leading article of to-day.

W. Stewart.—Stephanotus floribundus is a handsome stove-plant. Lindley's "Synopsis" contains all the flowering plants of Great Britain, but not the Cryptogamic. It may be obtained of any bookseller.

To *E. R.*—It is difficult to divide the colours of Pelargoniums satisfactorily, the gradation from one to the other being so slight. You will find a very agreeable variety in the following 24 sorts:—

White.
Annette.
Leila.
Witch.
Pink, Light Rose, and Rose.
Matilda.
Sylph.
Cyrus.
Clarissa.
Corona.
Florence.
Nymph.
Gaines's Prince Albert.
Bridesmaid.
Albion.
Alicia superba.
Orange.
Comte de Paris.
Orange Boven.
Erectum.
Emily.
Jewess.
Crimson.
Splendidum.
Gaines's King.
Grand Duke.
Arabella.
Purple.
Conservative.

Hopeless.—You say that seeds of Brachycome iberidifólia, Rhodanthe Manglésii, and Portulaca Thelussónii were sown in light rich earth in a good hotbed, though not in pots; and that many other seeds were sown at the same time, and in the same place, three weeks ago, and that all your seeds have germinated, and appear in full vigour, with the exception of the three first-named, which obstinately refuse to come up. You had better wait a little longer before you disturb them; if they do not appear soon, you may consider them fairly defunct. Your old Holly, for which you have a great regard, and which was severely injured by frost and salt winds some years ago, so that its branches are but sparingly covered with leaves, had better be cut back a little, and when it begins to grow, water the surrounding soil with nitrate of soda.

A Lady Subscriber.—Your plant is Fritillária meleagris; it may be obtained at any nursery.

Hortulanus.—No. 1 of your Heaths is so small a specimen, and there are so many which resemble it, that it is impossible to name it. No. 2 is Erica baccans. 3 is E. mutábilis, so called because the flowers become paler as they expand.

X. Y. Z.—The Pomegranate requires to be planted upon a dry subsoil, and in the warmest possible situation. If against a south wall, and the above directions be attended to, we have not the least doubt it will flower freely.

Ignoramus.—The botanical name of Fumitory is Fumária.

J. Jones.—The failure of your Hyacinths may, we think, be attributed to the copious rains which fell after you had planted the bulbs. The covering of dung and leaves would have suited them in a dry season, but in a wet one it merely served to prevent the bed from becoming dry.

J. H. S.—The plant you sent was Serissa fœtida.

To *C. W.*—The leaves of Pelargoniums frequently become spotted from the temperature of the house having been kept too low in winter, with a damp atmosphere; giving air immediately after syringing the plants will also cause it; and a similar effect may be produced by crude or stimulating manures. If the mischief arises from the first-mentioned cause, leave off syringing for a time, and get the temperature of the house into a more favourable condition; if from the second, keep the house closed after syringing: if it is caused by the reason last mentioned, repot into a milder compost, after shaking off the old soil.

Rochester.—The plant called Mercury (Chenopódium bonus Henricus) which you regard as an excellent vegetable, far superior to Spinach, and which in Lincolnshire is to be found in almost every garden, is a perennial; its young shoots peeled and boiled are eaten as Asparagus, while its leaves are dressed in the same way as Spinach. It is cut in the spring (very early), and after it has flowered is no longer fit for the table. It is then mowed down early in the summer. A little rotten manure is forked into the bed before it begins to shoot up, and it requires no further care, except to keep it free from weeds. It is not kept in the seedshops, but the seeds are easily collected from the wild plant, which grows in many places among rubbish. It is now out of cultivation, except here and there, in consequence of Spinach being preferred to it.

E. F. L.—If guano is used as top-dressing for meadow or pasture land, it must be in very small quantity. The best way will be to mix it with four times as much sand or fine mould, and to scale it with a shovel.

R. D.—We cannot advise you as to the quantity of Guano which it is safe to use for Pelargoniums. Experiments on the subject are wanted, and if you try any we shall be glad to be informed. This sort of manure, and many others of great power, require to be employed with much caution.

H. P. M. D.—Hibiscus esculentus is a tender stove herbaceous plant, easily cultivated in moist heat, but devoured by red spider if the air is allowed to be dry. Its pods are used as an ingredient in soups, which they render mucilaginous. We know nothing of the Cabul Melon.

Omikron.—The best course for you to take with your dried-up turf is to water it plentifully with the ammoniacal liquor of the gas-works, diluted with four or five parts of water. Nitrate of soda would hardly act so quickly or so energetically. Or, if you have any difficulty in procuring these substances, water it well with putrid yeast, diluted with water till it becomes as pale as small-beer. Should you prefer employing nitrate of soda, use it at the rate of 1 lb. to the square rod, dissolved in plenty of water.

Erratum.—In Mr. Major's Advertisement which appeared last week, the price of the set of six seedling Pansies ought to have been 30*s.*, and not 20*s.*, as printed.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The proceedings in the French Chambers still constitute the chief topic of interest in our news from Paris. In the adjourned debate on the supplementary credits, the question of the census, which gave rise to such serious disturbances last year, was brought under discussion, when the Chamber of Deputies negatived an amendment of the Opposition for a new mode of estimating the assessed taxes, and voted the supplies required by Ministers by a large majority. In the Chamber of Peers an interesting debate has taken place on the right-of-search treaty, in connexion with the seizure of two French vessels by English cruisers, on suspicion of being engaged in the Slave-trade. The remarkable feature of the debate was the decided manner in which M. Guizot announced the intention of the Ministry to maintain a good understanding with Great Britain: he protested against the continued attacks of the Opposition on the subject of the treaty, as having no other tendency than to keep up angry feelings between two great nations and Governments; he expressed on the part of the Ministry a profound esteem for the Government of this country, and declared that they would not permit their relations with it to be disturbed by animosities and public credulity. In regard to the Slave-trade, he said that the great task of effecting the abolition of that traffic was bequeathed to them by their predecessors, and no consideration should induce him to renounce the hope of completing so noble an undertaking. Advices of an unfavourable character had been received in Paris from Algiers, announcing the re-appearance of Abd-el-Kader at the head of a considerable force; the French Governor-General seems to have been taken by surprise, and the renewal of the war is no longer doubtful.—From Spain we learn that the Minister of Finance continues to meet with a strong opposition, and it is expected that the Regent will eventually be under the necessity of dissolving the present Cortes.—In Portugal, the commercial treaty with England, and the approaching elections, are the chief topics of interest. The Duke of Palmella has been appointed to conclude the treaty with this country, assisted by a special commission connected with the wine districts of Oporto, which are now suffering extreme distress from the decreased exportation. An extensive opposition to the Chartist Ministry has been organised, for the purpose of opposing the Government candidates at the new elections; but the Ministers are said to entertain little fear of the coalition.—Our German news announces that the Austrian Government are about to follow the example of England, and adopt a uniform rate of postage; and our advices from Belgium mention a serious mutiny which had broken out in one of the military prisons, and called for the interference of the troops before order was restored.—A few scattered rumours, relating to the late disasters in Affghanistan, have been published since our last, but they are somewhat contradictory in their details; one of these accounts states that Jellalabad had been attacked, and that a great battle had been fought, in which Akhbar Khan was killed; another mentions that the ladies, the hostages, and all the prisoners, continued to be treated with consideration; while a more recent report announces a further disaster at Ghuznee, which appears to require confirmation.

At home, the attention of Parliament has been occupied by the consideration of the new Ministerial measures. In the Lords, the Exchequer Bills' Commission Bill has been read a third time and passed, and the second reading of the Corn Importation Bill has been postponed until next week. In the Commons, a debate of some interest occurred on Monday, respecting the reception of a petition against the Income-tax: Sir Robert Peel opposed the motion for its admission, on the ground of the ancient usage, of 150 years' standing, excluding petitions against pending taxes; and on a division it was negatived by a majority of one. The question was again brought forward on Wednesday, when the feeling on both sides of the House appeared to be so strongly in favour of a relaxation of the custom, that Sir R. Peel gave way, when a series of resolutions, admitting petitions against pending taxes, but without discussion, were adopted. On the same night, after the debate on the Income-tax had been resumed, the House divided on the measure of Ministers and on the resolutions of Lord J. Russell, when the former was affirmed by a majority of 106.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Buckingham Palace. The Queen held a court on Saturday at Buckingham Palace, for the reception of Addresses on the Throne. On Monday her Majesty held, at St. James's Palace, a Chapter of the Order of the Garter; and on Wednesday a levee, the second this season. The Queen gave a state ball at Buckingham Palace last evening.—H.R.H. Prince Albert will direct the third Concert of Ancient Music on Wednesday next, on which occasion her Majesty will give a banquet to the directors at Buckingham Palace, and afterwards, it is expected, honour the concert with her presence.—The Viscountess Jocelyn has succeeded the Dowager Lady Lyttelton as the Lady in Waiting on the Queen, and Viscount Sydney and Gen. the Hon. Sir W. Lumley have succeeded the Earl of Warwick and Admiral Sir Robert Otway as the Lord and Groom in Waiting on her Majesty. The Hon. Miss Murray and the Hon. Miss Lister have succeeded the Lady Caroline Cocks and the Hon. Miss Cavendish as the Maids of Honour in Waiting on her Majesty.

Order of the Garter.—At a Chapter of the Order of the Garter, held by her Majesty at St. James's Palace on Monday, the Prelate of the Order, by her Majesty's command, read a new statute, whereby his Majesty the King of Saxony was declared a Knight of the Order. The Dukes of Buckingham, Beaufort, and Cleveland, and the Marquis of Salisbury were also elected Knights of the Garter, and invested by her Majesty with the insignia of the order.

Official Appointments.—The Marquis of Tweeddale has been appointed Governor of Madras, and also Commander-in-Chief of the forces in that Presidency.—The Government has appointed Sir Benjamin D'Urban Commander-in-Chief of the forces in India, and recalled Sir Jasper Nicolls, who was appointed in 1839. It is announced that Admiral Sir David Milne, G.C.B., will succeed Admiral Sir G. Moore in the Plymouth command; and it is understood in the naval circles that Admiral Sir Charles Rowley, G.C.B., will succeed to the Portsmouth command; and that Rear-Admiral Hyde Parker, C.B., will be the successor to Rear-Admiral the Hon. D. P. Bouverie, whose time will expire in July.—The Duke of Marlborough has been appointed Lord Lieutenant and Custos Rotulorum of Oxfordshire, in the room of the late Earl of Macclesfield.

Parliamentary Movements.—The petitions against the returns for St. Ives, the county of Tipperary, and Rochester have been abandoned. The Committee appointed to inquire into the Sudbury Election Petition have declared that the two sitting members, Mr. Villiers and Mr. Dyce-Sombre, were not duly elected for the borough of Sudbury at the last election; that the last election for that borough was void, and that the Committee had come unanimously to the following resolution: "That Mr. Villiers and Mr. Dyce-Sombre have by their agents been guilty of bribery at the last election; that the Committee are of opinion that a system of gross and extensive bribery prevailed at the last election, and consider it their duty to express their unanimous opinion that the borough of Sudbury ought to be disfranchised, and that a new writ ought not to be issued for that borough."

Gazette Announcements.—The Gazette of last night informs us that the Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignity of a Baronet of the United Kingdom unto the Right Hon. John Pirie, Lord Mayor of London. It also announces that her Majesty has been pleased to confer the honour of Knighthood upon James Campbell, Esq., Lord Provost of Glasgow; upon Henry Thomas De la Beche, Esq., F.R.S., Director of the Ordnance Geological Survey of Great Britain, and of the Museum of Economic Geology; upon William Drysdale, of Pittuchar, Esq.; and upon Major George Gun Munro, of Poyntzfield.

Foreign.

France.—*The Chambers.*—The Chamber of Deputies has been occupied since our last with the adjourned debate on the Supplementary Credits. The article granting one million francs for the expense of the census gave rise to an animated discussion; the Minister of Finance contending that its direction ought not to be left to the discretion of municipal councils. M. de Malleville argued against the system of the central administration, and proposed as an amendment, that in the session of 1844, and every succeeding period of ten years, a new estimate of the amount of taxes to be levied on doors, windows, furniture, &c., should be laid before the Chamber. M. Thiers supported the amendment in a speech which occupied two hours, and urged a number of objections against the present mode of taking the census. M. Duchatel, the Minister of the Interior, opposed the amendment, and after a lengthened debate M. Malleville's amendment was rejected, and the supplies required by Ministers were voted by a majority of 220 to 143.—In the Chamber of Peers, on Monday, an interesting debate took place on the subject of the right-of-search treaty, in consequence of the Marquis de Boissy bringing on his interrogation of the Ministry respecting the affair of the Marabout, a French vessel that had been seized by an English man-of-war on suspicion of being engaged in the slave-trade. All the Ministers were in their places, except the Ministers of Marine and Public Works. The Marquis de Boissy commenced by stating that he did not consider it possible for France to ratify the right-of-search treaty of Dec. 1841. He asked M. Guizot what must be thought of the current rumours, that the British Government had exacted this ratification? He then read at great length some reports relative to the capture of the Marabout, and complained strongly of the alleged ill-treatment of that vessel by the English officers, whose conduct on this occasion he considered as a violation of the treaty. He asked of the Minister of Marine (Admiral Duperré, who just then entered the Chamber,) if the reports which had been published respecting this transaction were correct; and if so, he demanded of the Minister of Foreign Affairs what steps he had taken to obtain reparation. The Prince of Moskwa (Marshal Ney's son) then ascended the tribune, and referred to the capture of another French ship, the brig Sénégambie, by British ships of war; a vessel which, he said, was employed in the transport of free negroes, engaged to be sent to the French colony of Cayenne. The Sénégambie was declared a lawful and proper capture by the Sierra Leone Court. The Prince contended that this was a violation of the treaty of 1833, because the vessels seized ought to be tried by the tribunals of the nation to which they belonged. He was of opinion that the Cabinet ought to have protested energetically against such a dangerous precedent. M. Guizot then rose to reply; and commenced by calling the attention of the Peers to the remarkable fact, that the Marabout affair was the first complaint that had been made since the treaties of 1831 and 1833. The Marabout, he said, had been seized on suspicion of being engaged in the slave-trade, and according to the stipulations of the treaties was conveyed to Cayenne to be judged. The crew was acquitted, and the tribunal awarded 260,000f. damages indemnity, due by the British Government for the seizure to the proprietors of the Marabout, and the latter thought this indemnity quite sufficient. The English Government had the right to appeal against the judgment, and all that the French Government could do was not to abandon its own. In respect to the affair of the Sénégambie, M. Guizot explained that it had been seized in British waters, and it was a principle of common law that anything that had taken place in the waters of a particular nation should be tried by the courts of that nation. France, continued the Minister, had only to complain of rigorous and bad actions, and she had done so with firmness, without disparaging the right which appertained to all nations, but at the same time protesting against unjust vexations, which nothing could justify. M. Guizot then repeated that France had not ratified the right-of-search treaty; that she had made no engagement to ratify it within any given period; and that since the first application, no solicitation had been made to the Government to ratify. The Ministry, he said, would at present confine itself to saying this, and not allow itself to be drawn into a more extended discussion. M. Guizot then proceeded to complain of the constant repetition of the same observations on this subject by the opposition, which had no other tendency than to keep up angry feeling between two great nations and governments. The Government had given up forming any particular and intimate alliance, but it was its intention to be on friendly and harmonious terms with all the European powers. "We are," he said, "serious in our ideas of the good understanding which it is our intention to maintain with Great Britain. We have a profound esteem for its Government, and we will not permit our relations with it to be disturbed by the contagion of animosities and public credulity. I do not say this with reference alone to our foreign relations; I speak also in the interest of a great question of a splendid cause now under discussion—the abolition of the slave-trade. France had the honour of first commencing this great work, and of imparting the impetus to it, before a religious party in England took it in hand. It is not for us to abandon so noble an undertaking. I have sometimes shown that I am not a man to hesitate at repudiating the errors of those who have gone before us, but no consideration should induce me to renounce the hope of completing the great undertakings which they commenced. The abolition of the slave-trade was one of them, and we are bound to continue it; we must not allow ideas and feelings which are opposed to it to take root. As regards the treaty of the 20th December, I will remain within just limits. The Chamber may be assured that we shall show no weakness or complaisance, but neither will we abandon the great work bequeathed to us by our fathers."

Boulogne.—Letters from Boulogne contain the report of an important trial which has taken place in that town, being the prosecution before the Boulogne Tribunal of First Instance of the courier employed by the "Morning Chronicle," "Morning Herald," and "Morning Post," to transport the late intelligence received by the Calcutta mail from Paris to Boulogne. M. Berryer, the most distinguished advocate of France, was engaged for the courier whose despatches had been seized. He made a most powerful speech, which produced considerable sensation in the court, but it extended to so great a length that our space will not admit of our giving even an outline of it. The main facts, however, of the case are these:—The Morning Papers have been in the habit, in order to ensure their readers an early publication of the authentic news brought by the overland India mails, of running extraordinary expresses from Marseilles to London. The French Post-office authorities, however, and the Administration of Finance, regarded these expresses as an organised system of competition with their "Malle Poste," which performs in 80 to 90 hours what the newspaper couriers did in 63 to 65 hours. On the occasion of the arrival of the India mail at Marseilles on the 23d Feb., despatches conveyed to Paris by the estaffette of the French Government were expressed in the usual way to London; but at Boulogne they were seized, and after being detained 24 hours, forwarded to their destination by the Post-office authorities of that town. This seizure was made the special subject of complaint to the British Ambassador in Paris, who has made representations to the French Government. The Post-office, however, relying on an old law, instituted the present prosecution against the courier who was the bearer of these despatches. After a most able and comprehensive argument, the learned counsel concluded by contending that this question of pretended contravention was connected with the most important interests; that its object was to contribute to the information and advantage of the public; and that the enemies and restrictors of the press befriended merely speculators. The Procureur-Général contended that M. Berryer's moral considerations were excellent, provided the law was under discussion; but the law was made, and the tribunal were bound to obey it. At the close of his speech, the President declared that the court would take time to consider the sentence, and would accordingly defer it for eight days.

Algeria.—Intelligence of an unfavourable character has been received from the seat of war. Accounts have been published from the Governor-General, General Bugeaud, dated Algiers, March 27, containing the report of an engagement between the French troops and Abd-el-Kader. The accounts of this affair, as given in the journals, are somewhat contradictory, but the following appear to be the main facts:—Gen. Bedeau, who had left Tlemecen, with three battalions, to execute a razzia upon a hostile tribe, had succeeded in his enterprise, and was returning to head-quarters with his booty, when Abd-el-Kader, who was supposed to have been abandoned by his adherents, and become a fugitive, suddenly appeared at the head of 3,000 to 4,000 infantry, and 1,500 regular cavalry. A battle ensued, in which, according to one version, the French had 60 soldiers and 7 officers killed; according to another, only 4 soldiers and 1 officer were killed. Some accounts state that Abd-el-Kader, after having re-captured all the cattle taken by General Bedeau, followed the army to the gates of Tlemecen, whilst others affirm that he fled with the loss of 150 men. The "Journal des

Débats" informs us that Gen. Bugeaud set out on the 29th ult. for Blidah and Medeah, with a body of 6,000 or 7,000 men, to act in the provinces of Algiers and Titteri, in the centre of the Regency, to bring about the pacification of the tribes, and overturn the authority of the three Kalifas of Abd-el-Kader. "These chiefs," the 'Debats' adds, "had some time since made overtures of peace, and Gen. Bugeaud had even repaired to Blidah, in the hope of following up the negotiations entered into with their emissaries: but he discovered that it was a new ruse of the Kalifas, to keep the tribes under their authority by holding out to them the hope of speedy peace. They claimed to treat on equal terms as power with power, required a large subsidy for maintaining tranquillity among the Arabs, and wished to exact the condition that the French troops should not advance on their territory. These overtures, however, were only a perfidious pretext; and it is even asserted that, under colour of an interview with the Governor-General, an ambuscade was arranged to carry him off." These despatches, announcing Abd-el-Kader's re-appearance, had caused considerable sensation in Paris, where the recent bulletins seem to have produced the impression that the war was drawing to a close.

Spain.—The Madrid Journals are unusually destitute of interest. The rumoured project of a marriage of the Queen with a Prince of Bavaria, noticed in our last on the authority of the "Morning Post," is stated to be without foundation. It is said that the Minister of Finance meets with a determined opposition in the Cortes; and some of the journals express an opinion that the Regent will eventually be under the necessity of dissolving the present Cortes. Some questions were put in the Cortes on the 1st inst. respecting an alleged misunderstanding between the garrison and population of the Balearic Islands, but the accuracy of the rumour was denied. A review of the National Guard of Madrid was held by the Regent on the 3rd inst. The 10 battalions of infantry, the cavalry, and artillery were drawn up on the Prado, and are said to have presented a fine appearance. They then formed into order of battle, after which the bands struck up the hymn of Riego; and when they had ceased playing, Gen. Valentine Ferraz, the Inspector-General, tied streamers to the colours, commemorative of the events of 1st September 1840, and 7th Oct. 1841, and afterwards caused a complimentary harangue on the courage and patriotism displayed by the civic guard on those occasions to be read to the different corps. The Regent next rode through the ranks, amidst loud acclamations; and, in his turn, addressed the soldiers in an energetic harangue. The Infante Don Francisco de Paulo was shortly expected to pass through Madrid on his way to Aranjuez. The Minister of Justice has sent orders to the authorities on the French frontiers to arrest, and remove to a distance of at least twelve leagues into the interior of the kingdom, the vicars of Elisondo and Zugarramurdi, and several other clergymen residing in the adjoining districts. M. Patricio Olavarria, former editor of the Republican journal *Huracan*, has addressed to the electors of Corunna his resignation of the post of deputy for their city, declaring that he should consider himself dishonoured by accepting a seat in such an assembly. The Barcelona journals of the 4th inst. state, that the Captain-General had given notice to the Ayuntamiento of his having received orders from Madrid to deliver arms to the three battalions of National Guards of that city, disbanded in 1841.

Portugal.—We have received, by the Braganza steamer, intelligence from Lisbon to the 4th instant. The commercial treaty with England, and the approaching elections, are the chief topics of interest. A strong representation in favour of the former, in which a serious picture is drawn of the distressed state of the wine districts, had been received from Oporto. A special commission, composed of persons connected with the north, had been appointed by the Queen to deliberate what was best to be done. The Duke of Palmella has been appointed to conclude the negotiations with Lord Howard respecting the Commercial Treaty, and also to negotiate about the Slave Trade Treaty, and has already had an interview with Lord Howard on the subject. The journals inform us that a triple league of Miguelites, Septembristas, and a few ex-deputies called Opposition Chartists, has been formed for the purpose of opposing the Government candidates at the ensuing elections. The Septembristas are said to form the strongest part of the league, which has published a circular to the electors, denouncing the Government in strong terms. It is also stated that Senhor Magalhaes and his friends, although still holding aloof from the Government, have refused to join the new coalition; and that the Government does not appear to entertain much fear of this new coalition against it. Efficient measures are said to have been taken by Senhor Costa Cabral, as Home Minister, to prevent the frontier districts being made the resort of intrigues against the Spanish Government. Copies of the despatches sent to the local authorities have been sent to Madrid, and satisfactory assurances have been received in return. Donna Maria's birthday, the 4th inst., was kept with the usual ceremonies; and there was a bull-fight, at which the King attended. Viscount Santarem, Minister of Foreign Affairs in the time of Don Miguel, has been appointed by Costa Cabral superintendent of the Royal Archives. The Viscount is consequently expected shortly to return from Paris, where he has been residing since the change of Government. An entertainment was to be given on the 5th inst. on board the Indus, to the French officers in the Tagus; for which upwards of 500 invitations are said to have been issued.

Germany.—Our German news is not of great importance. Private letters, dated Vienna the 1st inst., announce that the Austrian Government is about to follow the example of Great Britain, and adopt a uniform rate of postage. According to the present system, there are seven classes or rates of postage, varying from 2 to 14 kreutzers, in proportion to the distance. The Government, it is said, proposes to commence its reform by reducing these seven classes to two—one at 6, and the other at 12 kreutzers; and finally, to adopt a uniform rate of postage of 6 kreutzers, equal to about 2d. British. We learn from the same authority that the Austrian Government is also about to surrender the monopoly of stage-coaches, which it has hitherto held in its own hands, and allow the fullest liberty for private enterprise in every matter which relates to travelling, in the same manner as in Great Britain. The last accounts from Vienna state that Prince Augustus of Coburg Cohari has been promoted to the rank of Major in the Austrian army. It is announced that 30,000 men are to be discharged this year from the army, and that the new levies will not exceed 26,576 men; although the usual number is 40,000. Of this amount 7,200 are to be furnished by Bohemia. The operation of recruiting will commence in April, and terminate about the end of May.—The Berlin journals of the 2d inst. give a Cabinet order for the reduction of the interest on Prussian Treasury Bonds from 4 per cent. to 3½ per cent. They also state that the King of Prussia will stop some time at Konigsberg on his intended journey to St. Petersburgh, to inquire into the complaints made by the inhabitants respecting the Russian prohibitive duties; and they mention a report that Konigsberg is to become a fortified town of the first class, and that the works are to commence next summer. According to other accounts, Lotzen, in Prussian Lithuania, is also to be fortified. The publication of a decree restoring to the Rhenish Provinces the principle of trial by jury and public trials, although not without exceptions, has been celebrated at Cologne by a public festival.—The Leipsic journals mention the arrival in that city, from Russia, of a German who has attained the great age of 119 years. He was born near Friburg on the Unstrut, in Saxony, but when only 19 went to St. Petersburgh, and worked as a locksmith. He was afterwards admitted into the Royal manufactory of arms, where he remained until a short time ago, when the Emperor noticed him, and promised to confer upon him any favour he would ask. He desired permission to return to his own country, which his Majesty not only granted, but sent him in a private carriage, attended by a physician. After resting at Leipsic a few hours, he proceeded to his native place. It is stated that the French authorities surrendered, on the 4th inst., to the police of Hesse Darmstadt, a political refugee, implicated in the revolt of the Frankfort students in 1833, on an application from the Government of that duchy. Charles Ruthz, the refugee in question, had resided, it seems, in France since his emigration and earned a subsistence by working as a journeyman upholsterer, at Strasburgh and Colmar. The Hessian Government, having no chance of obtaining his extradition by claiming him as a political offender, founded a demand to that effect on an alleged charge of forgery, and the French Government, deceived, it is said, by the stratagem, ordered him to be delivered up.—It is stated that the Pope has accepted the renunciation of the Canon Arnoldi, who was chosen Bishop of Treves, and confirmed the appointment by the Government of another canon. It seems, therefore, that the bishopric will be soon filled up; but it is not said whether M. Arnoldi, as *persona grata*, can be admitted to the election.

Hanover.—Accounts from Hanover, dated the 5th inst., mention a report that the king, immediately after his return from Berlin, where he is at present on a visit, will go to St. Petersburgh, to be present at the fêtes on the 25th anniversary of their Imperial Majesties' marriage. His Majesty will afterwards pay a visit to England.

Belgium.—Accounts from Brussels, dated the 8th inst., state that on the 5th inst. a serious mutiny broke out in the military prison at Alost; which originated in the refusal to supply the prisoners with tobacco for smoking. They attacked the keepers, who were obliged to yield to numbers; upon which the burgomaster proceeded to the spot, and seeing the exasperation of the men, caused tobacco to be given them. This restored tranquillity for the time, but on the following morning they made further demands, which were refused. They then again mutinied, and tried to open the prison-doors, in which, however, they did not succeed; and the magistrates surrounded the prison with troops. The prisoners then got on the roof, and pelted the soldiers with stones, so that it became necessary to have recourse to arms, on which the roof was soon cleared. Ten of the prisoners were wounded, one mortally. Meantime troops were sent from Brussels and Ghent by the railway; and detachments of Lancers, in barracks at Malines, and several brigades of gendarmes of Brabant, also set out for the town. It seems, however, that order was restored before their arrival, as the gendarmes sent from Brussels received orders at Asche to return. The journals state that the physicians have advised his Eminence the Cardinal Archbishop of Malines to pass some time in Italy, for the recovery of his health, and that he will in consequence shortly leave Brussels for that purpose.

Holland.—Intelligence has been received from the Hague announcing that the solemnity of the betrothing her Royal Highness Princess Sophia of the Netherlands and the Hereditary Grand Duke of Saxe Weimar was performed in the Palace on the 5th inst. The King exchanged the rings of the parties in the presence of the Queen and other members of the Royal family, as well as of the members and officers of the Royal household.

Switzerland.—Private accounts from Geneva, dated March 20th, state that Switzerland seems to be comparatively deserted by travellers, and that Chamouni as well as Geneva has, during the last few years, had less visitors than formerly. Last year their number was estimated at 2,650, about 350 less than in the year 1840. The English still continue to form the majority of tourists; and there are also many Germans. There have been but few mountain excursions this season, owing, it is supposed, to the unfavourable and changeable state of the weather. Mr. G. Campbell, a Scotch gentleman, crossed the Col-de-Geant as late as the 1st of Oct., accompanied by two guides and a chamois-hunter. Besides stormy weather, they are said to have encountered considerable danger from falling fragments of the glaciers.

Russia.—The annual report of the police of St. Petersburgh for 1841 contains the following particulars:—Population at the close of last year—males, 303,232; do. females, 152,591. Total, 455,823. Compared with 1840, there was a decrease of 14,579. Deaths—males, 12,120; females, 6,473. Total, 18,593. Births—males, 6,182; females, 5,627. Total, 11,809. Excess of deaths, 6,784. There were 1,790 more births than in 1840: 11,118 children were vaccinated. Cattle brought to market:—Oxen, 109,633; cows, 30,639; sheep, 22,746.

Turkey and Egypt.—Private letters from Constantinople, dated March 16, mention a report that the English Government has asked permission of Mehemet Ali to march a body of troops over the Isthmus of Suez, for the purpose of facilitating their arrival in India. The Pacha is said to have answered that he could not make a concession of this description without the approbation of the Sultan, and one of the objects of Sami Bey's visit to Constantinople is stated to be to represent to the Sultan the inexpediency of granting a similar permission, and to suggest the propriety of erecting a line of forts on the coast of the Red Sea. Sami Bey has paid to the Sultan nine millions of piastres, as part of the tribute imposed on Mehemet Ali; and one object of his mission is understood to be to obtain a reduction of the arrears still due to the Porte. It is also reported that he is to request for the Pacha authority to enforce the duty of two per cent. on Austrian and English merchandise. Several thousand Albanians have been recently embarked at Volo, to reinforce, it is said, the army in Syria.—The French papers publish a letter from Constantinople, stating that "Baron de Bourqueney, the Minister of France at the Porte, had consulted all the heads of the different rites of the Catholic religion in the Ottoman empire, respecting the inconveniences and dangers which might accrue from the erection of an Anglican Protestant Bishopric in Jerusalem. All replied that they were without the least uneasiness on the subject, convinced that the Anglo-Prussian apostleship could only tend to strengthen the Catholic influence, and to cover with ridicule, in the entire East, this attempt at Protestant proselytism."—A report was current at Alexandria that Capt. Basil Hall had been upset on the Nile, but no lives were lost.

Persia.—The German papers state that accounts have been received by way of Berlin, affirming that a Persian army of 50,000 is on its march against Herat. It is added that the Shah was not to be dissuaded from executing the plan he had formed by the remonstrances of the British Ambassador, and not even by the threat that England would consider this step as a declaration of war against itself. It is even reported that a sum of two millions of silver rubles had been received by the Shah from a northern power as a subsidy to enable him to undertake this expedition; but it requires confirmation.

India.—As any information tending to throw light on the melancholy events which have taken place in Affghanistan will no doubt be read with interest by our readers, we subjoin one or two reports connected with this subject that have been published since our last, with the authorities from whence they are derived. The "Calcutta Englishman" of the 14th Feb. states, that intelligence had reached Lahore on the 27th Jan. "to the effect that Akhbar Khan, having come down upon Jellalabad in great force, and having been met by our troops on the plain, a battle was fought, in which he and a great many Affghans were killed." It appears very doubtful, however, whether there is any truth in this report, which, if authentic, might have been expected to reach Bombay before the 1st March, the date at which the last mail left. An extract, moreover, from a letter from Kurnaul of the 6th Feb., which has been published, makes no mention of such an event. The "Morning Post" of Tuesday published the following communication received from a correspondent: "In a letter received this morning from Major Skinner, of her Majesty's 31st regiment, on his way to join the army destined for Cabul, dated 16th Feb., he incloses a note he had just received from Mr. Hamilton, secretary to the government:—"My dear Major: In a letter from Capt. Lawrence, dated 29th Jan. (one of the prisoners,) he mentions Capt. Skinner as quite well, and all as comfortable as possible. The ladies and prisoners, and hostages, were well treated." The "Scotsman" of Saturday has the following short extract of a letter from India, which it subjoins without comment:—"Bellary, 22d Feb., 1842. Wild has forced his way to Ali-Musjeed with the four native regiments; I sincerely trust he may save Sale, and not be himself cut up."—The "Times" of yesterday states that a letter has been received, dated Bombay, March 1, from a General Officer to a relative in this country, which communicates the following intelligence:—"Accounts have come that Ghuzni has been taken, and the garrison, 1,000 strong, put to the sword. General Nott, it is also said, is preparing to retreat; although in Candahar, at the head of 12,000 men, he ought to hold good his position for years, as with such a force he might command the country round." The "Times" observes on this, "We cannot, of course, vouch for this intelligence, but it comes to us with considerable appearance of authenticity."—The writer of this letter is Gen. Brooke.

United States.—The packet-ship North America, Capt. Lowber, which sailed from New York on the 19th ult., arrived off Liverpool yesterday. She has, owing to easterly winds, been seven days in working up from Cape Clear. The papers received by this conveyance are three days later than those brought by the Hibernia, whose advices were reported in our last. Private letters state that the apprehensions of a war are beginning to subside, and that in the best-informed quarters a strong belief prevails that an amicable arrangement will be effected. Lord Ashburton had not yet arrived, but was hourly expected. His mission is said to be regarded by the Government and the intelligent classes as a pledge that the British Ministry is influenced by pacific views. A meeting of merchants and others had taken place in New York, for the purpose of urging upon Congress the necessity of promptitude in regulating the currency, and placing the country in a posture of defence; but it was supposed to be connected with ulterior political views. The Philadelphia banks have resumed payment. A letter had reached New Orleans, stating that a British steamer was ashore on Turk's Island.—The British steamer Medway was at Havannah at the last dates, and that vessel, together with the Tay, Solway, and Forth, had an aggregate amount of 490,000 dollars on board, from Honduras, Vera Cruz, &c., bound for England. Mrs. Fitzwilliam and Mr. Buckstone are playing at the Havannah; and Fanny Elssler is not as successful as she anticipated in the West India metropolis. Lord Morpeth and Mr. Dickens continue to be received in all parts of the States with distinguished honours.

Parliament.

HOUSE OF LORDS.

Monday.—The Earl of Ripon postponed the second reading of the Corn Importation Bill from Friday until Monday next.—Lord Campbell moved the second reading of the three bills by which he proposed to transfer to the House of Lords the power at present possessed by the Privy Council, of hearing appeals, to reform the appellate jurisdiction of the House of Lords, and to render permanent the office of Chief Judge to the Court of Chancery.

The Lord Chancellor opposed the bill. He could not, he said, agree to the proposition for extinguishing the appellate jurisdiction of the Privy Council, and converting the House of Lords into a general court of appeal, considering the proposed remedy to be of too sweeping a nature. He had heard many suggestions for improving the appellate jurisdiction, but he must say that, of these, the plan of his noble and learned friend was the most extravagant and the most objectionable. He, therefore, moved that the bill be read a second time that day six months.—Lord Brougham agreed in opinion with the Lord Chancellor; after which Lord Campbell replied, and was followed by the Duke of Wellington, who said that he would not occupy their lordships' attention on a subject which had been satisfactorily disposed of by the speech of his noble and learned friend on the woolsack; but he wished to say a word on one point, bearing on the great office of the Chancellorship, so important in the government of this great empire, and not merely from the judicial business despatched by its holder in the Court of Chancery and in that House. That office was most important from its station in the administration and in the law, the Lord Chancellor presiding over the debates of that House, and holding a high place in her Majesty's councils. Their lordships should take care, then, that there was not appointed to that office a person ignorant of the laws of this country, and of the daily practice of them in the Court of Chancery. If this question, then, were brought before the House in a future session of Parliament, he hoped the noble and learned lord would take care to provide that the Chancellor should be a barrister of 15 years' standing.—The second reading of the bill was then negatived without a division.

Tuesday.—After the presentation of petitions, Lord Melbourne gave notice that, on going into committee on the Corn Importation Bill, he would move that a fixed duty would be more advantageous than a graduated one.

The Duke of Wellington moved the second reading of the Exchequer Bills Commission Bill. He said that the necessity for such a step arose from the frauds which had been practised with regard to Exchequer Bills. Now, as there had existed for a considerable time a suspicion of the existence of those frauds, and that numbers were engaged in them, it was deemed desirable, in order to place the matter clearly before the public, that a commission should be appointed, with a view of making inquiry into every point which could lead to the elucidation of these transactions. This proceeding would not prevent the *bona fide* holders of these securities from proceeding against the party from whom they might have received them in due course of law, as the Bank had done in one instance, and might do again; but Government felt called upon to institute this inquiry for the purpose of seeing in what manner these transactions were conducted. The noble duke concluded by moving the second reading of the bill.

Lord Brougham had no objection whatever to the second reading of this bill, or, generally speaking, to its details. He should, however, in committee, propose a clause to protect persons against all pains and penalties consequent upon their exposing themselves, by their evidence, to action; and as an inducement to persons to disclose all they knew about these transactions, he should enlarge the usual clause by promising that they should be protected for all voluntary answers, even when the parties making them knew them to be actionable.—Lord Monteagle expressed a strong opinion in favour of the publication of the whole evidence.—The Duke of Wellington thought the suggestion worthy of consideration.—The Lord Chancellor urged the expediency of suspending the publication of particular parts of the evidence till the conclusion of the whole inquiry.—Lord Monteagle said that all he desired was, that at some time or other the whole evidence should be published.—The bill was then read a second time.

Thursday.—Lord Western, in presenting a petition from the farmers of Essex against the Corn Importation Bill, stated that the petitioners complained of being deceived by the right hon. Gentleman at the head of Government, and by their own representatives. The noble Lord said he could bear his testimony to the fact that the belief among the farmers was general that they had been deceived by the present Government, and they knew they had been deceived by their own representatives. The feeling which had been expressed on a recent occasion, that the Government measure had driven the farmers from the frying-pan into the fire, was universal in his county, and would, he added, be universally expressed, but that the Conservative landlords kept down the spirit of farmers to the utmost extent.

The Duke of Wellington rose and said, "I think, my lords, that it would be quite as well if noble lords would abstain from such harsh expressions as that the country had been deceived by my right hon. friend at the head of the Government, and that the people had been deceived by their representatives. My lords, I think that such expressions should be avoided—at least until the House came fairly to the question, and noble lords should have the opportunity of stating the when, and the where, and the how, and in what words my right hon. friend had deceived the public. I think it would have shown more candour in the noble lord (Western) if he had taken that course, than the making use of such an expression in presenting a petition. I say again, my lords, that the noble lord should have waited for the opportunity of stating the when, and the where, and the how, and in what words my right hon. friend had deceived the public. But, my lords, I deny the fact; and, as formally and emphatically as the noble lord has stated it, I say it is not true, and that's the end of it."—Lord Western explained. He did not say that the right hon. Baronet had wilfully deceived the agriculturists; but his conduct had led to the conception, on their part, that he would never have entertained the measures now before the country. The subject then dropped.

Lord Kenyon presented a petition against any further grant to the College of Maynooth. The Earl of Wicklow and Lord Cloncurry expressed an opinion that the grant should be enlarged, in order to induce the sons of the Catholic gentry to enter into holy orders, instead of leaving the priesthood to be recruited exclusively from the humbler classes of the community.

On the motion of the Earl of Ripon, the Merchants and Factors Bill was read a second time, with an understanding that the discussion should be reserved for the committee.

On the motion of the Duke of Wellington, the Exchequer-bills Bill was committed. It was reported without amendments, and ordered for a third reading on Friday.

The Irish Spirit Duties Bill went through committee, after some observations from the Earl of Wicklow and Lord Monteagle, who expressed their apprehension that the measure would lead to the increase of illicit distillation.

Lord Duncannon moved resolutions, with a view to the improvement of the management of the naval schools attached to Greenwich Hospital. The resolutions were opposed by the Earl of Haddington, and negatived without a division.

Friday.—The Exchequer Bills Bill was read a third time and passed.—The Marquis of Normanby presented a petition from Hull, complaining of the number of commissions of the peace issued by the Government, declaring that Sir J. Graham had already issued no less than 364 such commissions to Conservatives.—The Lord Chancellor contended that the late Government had acted from party motives in their appointments, and that the present Government were merely tempering an evil by restoring the balance of political parties.

HOUSE OF COMMONS.

Monday.—The Stanhope and Tyne Railroad Bill was read a third time.

The following private Bills were read a second time, and ordered to be committed:—The Forth and Clyde Navigation Bill, the Glasgow Police Bill, the City of Glasgow Life Assurance and Reversionary Company Bill, the Cumberland Roads Bill, the Ross and Cromarty Courts Bill. A debate then ensued respecting the reception of a petition from Finsbury presented by Mr. Duncombe against the Income tax. The subject, it will be remembered, was discussed by the House last week, when the motion of Mr. Duncombe was lost by a majority of 167 to 136. The hon. Member, however, again brought the question before the House on Friday, but the debate on it was adjourned till this day. Sir R. Peel now opposed the reception of the petition on the ground of the ancient usage excluding petitions against pending taxes. If that usage should be rescinded, great obstruction to public business might be the consequence. It was true that a resolution now existed against the debating of petitions, but that resolution had raised a usage of only five years, whereas the other was of 150. He was aware that much difference of opinion existed on this subject; but he thought himself bound not to abandon a practice of so long standing without taking the sense of the House upon it.—Lord Howick thought the old objection to these petitions was removed by the modern prohibition of discussion upon them. Sir R. Peel, he said, seemed to have no reason to urge against the change, except that it was a change.—Mr. Milnes supported the old practice, because he thought that if the House, by a large majority, should sanction a tax, while the country in general was petitioning against it, an opinion might grow up that the House did not duly represent the people.—Mr. F. Berkeley briefly supported Mr. Duncombe; and Lord F. Egerton thought that the doors of the House should be opened as wide as possible to the people's petitions.—Lord J. Russell, though reluctant to contravene a practice which had prevailed for 150 years, felt himself obliged, since the departure from the old usage of debating upon petitions, to support the motion of Mr. Duncombe. He could not consent to maintain the customs of antiquity only on the side of restriction. He thought that even if they should now shut out these petitions against the enactment of the pending tax, they could not shut out petitions next year for its repeal. The rational course, he considered, would be to allow the presentation of these like all other petitions; but, as in the case of other petitions, to exclude discussion.—After some remarks from Mr. S. Wortley, who said he should support the motion, Sir J. Graham observed, that this usage had originated soon after the Revolution, at a period highly favourable to the rights of the people, and had continued uninterrupted for a century and a half. The recent exclusion of discussion might perhaps be rescinded; and if that should happen, he thought that the supply might be effectually obstructed, and the Crown left without a remedy.—After a few observations from Lord J. Manners, Capt. Hamilton, and Lord Sandon, Mr. Goulburn deemed it highly important that the practice of the House should not be rendered uncertain, and above all that resolutions should not be left on the books and daily violated. If the practice ought to be changed, it should be done by a motion to rescind the ancient resolution establishing it.—Mr. Duncombe said, his object was to break down a practice which he regarded as an unconstitutional, however it might be an ancient, one. No antiquity could sanction such an injustice. If this petition should be rejected, another would be presented next day; so that Ministers would not be much advanced by their resistance. If they wished to exclude petitions, he thought the manly way would be to move a standing order to that effect. He concluded by saying that the people disliked the pending tax, and that the object now was to gag them. The House then divided, and the numbers were—For the exclusion of the petition, 222; for its reception, 221; majority for the exclusion, 1.

Several notices of motion were given, and the order of the day was then moved for the resumption of the adjourned debate on the Income-tax. Dr. Bowring declared, that though bound to vote against the proposition of the Income-tax, he could not vote for Lord J. Russell's resolutions without qualification. He decidedly preferred direct to indirect taxation, and hoped Sir R. Peel would show as much courage in attacking the large monopolies, as he had done in assailing the smaller ones.—Mr. G. Knight sketched a draught of the will of the late Ministry, bequeathing to John Bull a deficit of 5,000,000*l.*; item, a war in China; item, a war in India; item, an unsettled boundary in America. He reprobated their reduction of taxes for the sake of popularity, and their resort to the expedient of loans. Referring to an expression that had been used during the debate by Lord J. Russell, that the landed gentlemen had heads of clay, he avowed his opinion that they would deserve that sarcasm if they did not show that they had the sense to support their friends against their enemies.—Mr. Elphinstone endeavoured to show that the Income-tax would press very differently on the commercial as compared with the agricultural interest.—Sir W. James protested against the unnecessary protraction of the debate, and characterised the financial scheme of Government as a great and comprehensive plan.—Mr. Wallace objected to an Income-tax on account of its inquisitorial nature, but admitted that, if adopted at all, it ought to apply to all incomes, from whatever source arising. He, moreover, objected to the exemption of Ireland from the proposed impost, and stated his determination to take the sense of the House on this point.—Mr. Liddell commented upon the manner in which the Whigs had redeemed their pledges of reform, retrenchment, and peace. Reform, he said, they had carried; but what had been their retrenchment? They had retrenched income, and increased expenditure. And as to the peace they had procured for their country, he had only to refer to that expedition into Affghanistan against which the Duke of Wellington had so wisely and so early warned them. With respect to the measure now proposed for the repair of those evils, he gave it his cordial approbation.

Mr. Wason admitted the necessity of a Property-tax, but objected to an Income-tax, as pressing almost wholly on industry.—After some observations from Mr. C. W. Wynn, who said that after mature consideration he should support the Ministerial measure; Mr. Macaulay said that an Income-tax could only be justified by the last extremity, and that such a state of things did not exist at present. Was there ever, Sir R. Peel had asked, such a disaster, as the recent destruction of our Indian army? In one sense certainly, he admitted that catastrophe was deeply disastrous—deeply so, with reference to British honour and domestic feeling; but in a financial view, the only view material to the present question, the disaster was not of the same importance. The fact was not even known when the right hon. Baronet brought forward the present measure of taxation; and it certainly was not likely to require any greatly expensive armament. Ten or twelve thousand troops, he thought, would be an ample force; of which the whole charge would probably fall short of 400,000*l.* a year. He considered that nothing but prudence and firmness were required in the management of our eastern empire, and that the general state of our present affairs admitted of no comparison with those under which the former Income-tax was imposed. Foreign nations, he said, regarded its proposition as evidence of our downfall. Sir R. Peel was, in fact, not only exaggerating our difficulties, but making deficits as excuses for the Income-tax. Mr. Macaulay concluded by saying that it had been proved that nothing but the greatest extremity could vindicate a measure of this kind; that the country was not in such an extremity as alone could justify it; that the right hon. Baronet had greatly exaggerated the financial difficulties of the country; that he had dragged into the discussion subjects which were not connected with it, when he first formed the plan of the Income-tax; adding to those suggestions vague hints of great expenses hereafter to be occasioned by the necessity for supporting the credit of the India Government, but which expenses formed no part of the present deficit; and that the right hon. Baronet had neglected a plain, simple, and obvious mode of replacing that deficit, one that would be of the greatest benefit to the country, while he had at the same time voluntarily increased that deficit by throwing away a distinct source of existing revenue—he meant the duties on timber. Under all these circumstances he should cordially vote in favour of Lord J. Russell's resolutions.

Lord Stanley said, that whatever might be the difference between the two sides of the House in their conclusions, there was no disagreement in their premises; the greatness of the deficit was no matter of doubt; and the Opposition, now that they were no longer under the responsibility of having taxes to find, admitted likewise that the time for make-shifts was over, that the finance of the country must be repaired, that the burden could not be thrown upon the commercial and manufacturing interests, and that the budget of last year would not yield a revenue adequate to the occasion. On his own side it was equally admitted that a great emergency alone could justify such a tax. These were the points of general agreement. On the other hand, there were disagreements to be noticed even among the Opposition themselves. Some said, "Tax property, but not income;" while others, and Lord John himself, said, "If you tax property, you must needs tax income too." Lord John and Mr. Macaulay objected to the course taken upon the sugar and timber duties. Mr. Williams, of Coventry, took a wholly opposite view to both of them. Lord John had said, an Income-tax has hitherto been a war reserve—no great compliment, he considered, to his own government, which, after 20 years of peace, had placed our finance under difficulties equal to those of war. When, he would ask, had it been necessary before to hold 20,000 bayonets in Canada? Who could tell what cost would be entailed on England by the war which the late Ministry had stirred up in China? Talk of peace! Look at India. The Duke of Wellington had prophetically told them what would be the consequences even of success in that quarter. "A disaster certainly," Mr. Macaulay had admitted, "but," he had added "not a financial one." When the right hon. Member had thus estimated the lives of those brave men in pounds, shillings, and pence, who could calculate the further cost in which they might be involved by the spread of that insurgency against the *prestige* of England, which was but too likely to follow such an overthrow? He acknowledged the inquisitorial nature of a tax upon income, but the bill imposing it would contain alleviations of this objection. And what, he would ask, would the noble Lord, who proposed an increase of the assessed taxes, say to the inquisitorial nature of those assessments? The present call was made upon the country, not to pay off past debt, but to meet present annual expenditure; and so far from an unjust tax, he believed it to be both an equitable and a wise one. The noble Lord concluded by saying that the measure was one calculated in the best possible degree that circumstances would admit of to raise commercial credit, to relieve the financial embarrassments of the country, and one of its highest recommendations, to use the words of a strong political opponent of the present Government, was, that it was "short, honest, direct, and straightforward."

Mr. Labouchere, after defending Mr. Macaulay from what he complained of as a misrepresentation by Lord Stanley of that part of his speech which related to the disaster in India, contended that the necessity now alleged by Ministers was of their own creating, and that the country was becoming decidedly aware that the Income-tax was the price for the maintenance of the sugar and other monopolies; and he contended that the measures of the late Government would have superseded the necessity for it. He admitted the importance of the tariff, and expressed his regret that the most valuable portions of it had excited the strongest opposition.

Lord F. Egerton condemned, as being no longer a mere excusable party manœuvre, but a positive crime, the delays by which Members of Opposition were paralysing the trade of the country, and he read some passages of a petition from Lancashire, numerously signed, praying for the despatch of this measure. So far from thinking that the course of Ministers had lowered on the Continent the estimate of England's resources and spirit, he inferred from the foreign journals that the tone and measures of Sir R. Peel had impressed our neighbours with the highest respect for the country so governed. His right hon. friend should have his vote for the additional estimate for India which it would be necessary to propose. He thought that though it might not be advisable to do so at the present moment, the time might come when the people of this country would inquire whether the disasters which had occurred in India might not have been avoided by pursuing a different line of policy, and would visit with censure and distrust those who should be proved to have contributed to such grave and unfortunate results, either by misunderstanding or any other cause. The vote which he would give on this occasion would be in the nature of a vote of confidence. He would give it, because the present administration enjoyed the advantage of the counsels of a man whose name, both by himself and his kindred, was united with the brightest period of the most glorious cycle of Indian annals, and though age might have unnerved the arm which in the vigour of youth scattered like dust the sable hordes of the Mahrattas and the Mysore, the light of that clear sagacity which glanced over the field of Assaye still burned with unimpaired vigour. He wished the counsels of that great man had always been more attended to: at all events, they were now at the disposal of those who would give them due attention, and upon that ground he would give his support to the measures which the Government proposed for extricating the country from its present state of embarrassment.—Mr. Brotherton moved an adjournment.

Lord J. Russell imputed the delays complained of to the party opposite, who had thought it more material to displace the late Government than to discuss the import duties. As for the expedition to Affghanistan, he did not shrink from his share of responsibility; but the papers relating to it had been laid on the table last year, and no motion had been grounded on them by the opposite party. He was ready to identify himself with Lord Auckland in this matter.—Sir J. Hobhouse expressed himself to the same effect. He said that when the estimates for the supplementary force should be moved, he would take an opportunity to state the case of the late Government. Some desultory conversation took place, which occupied some time, after which the debate was again adjourned.

Tuesday.—Mr. C. Standish took the oaths and his seat for the borough of Wigan, in pursuance of the decision of the election committee.

The following bills were read a second time, and ordered to be committed:—The London and Croydon Railway Bill; [illegible] Road Bill; the Tyne Fisheries Bill; the [illegible] Railway Bill; and the New Cross Roads Bill.

After the presentation of several petitions, Mr. [illegible] [illegible] he proposed a petition from [illegible], against the Income-tax. The hon. Member hoped that, after the vote of last night, no opposition would be made to the reception of this petition.—Lord F. Egerton desired a postponement of the debate until Thursday, on which day he would submit a resolution having for its object to admit petitions against taxes, with a due precaution against their being debated.—Mr. T. Duncombe said he had no notion of letting Lord F. Egerton make a feather-bed for Ministers to fall easily down upon.

Sir R. Peel replied that he was in no fear of a fall, and therefore wanted nothing to break his descent. He had opposed the abrogation of an ancient rule, and the House having [illegible] his course by a majority of [illegible], he had also opposed the presentation of the [illegible] petition. The majority, however, having [illegible] [illegible] but that it would be difficult to maintain the practice. But it was surely desirable, if a change was to be made, that it should be made without irregularity; and he did, therefore, wish for a short interval to frame such a resolution as would effect the object in a safe and [illegible] manner. [illegible] [illegible] be [illegible] for the purpose of petitioning would be [illegible]. A desultory debate ensued, during which some Members on the opposition side of the House protested against what seemed to them a compromise, and other Members declared that there was no [illegible], [illegible] as the [illegible] had [illegible] that it would give way; and ultimately Mr. Cowper [illegible] to the adjournment of the debate till Thursday, which accordingly took place.

Mr. Wason called the attention of the House to the practice [illegible] by counsel before the election committees, with the view of providing a remedy, and made a motion for restricting election counsel to one committee at a time.—Sir J. Graham and Mr. [illegible] endeavoured to show the impracticability of any such regulation; and after a short debate, in which several Members joined, the motion was withdrawn.

The adjourned debate on the Income-tax was then resumed by Mr. Brotherton, who admitted that there was not such an opposition in Manchester and elsewhere against the Income-tax as he had anticipated. For himself, however, he [illegible] the tax to be unnecessary, and therefore he would oppose it.—Mr. [illegible] made a few observations in favour of the tax.—Capt. [illegible] [illegible] himself to the subject of our Indian finances, and endeavoured to prove that those finances were in a more flourishing condition than ever; they were [illegible]. The Indian empire, he said, rested on moral as much as physical power; and, so far as its condition was concerned, he saw no ground for the imposition of an Income-tax.—Mr. [illegible] [illegible], though aware of the [illegible] nature of a plea for any tax, was yet prepared to support the Income-tax, from a conviction of its justice and necessity. He felt the inequality of taxing [illegible] [illegible], but he considered that the [illegible] was not peculiar to this tax; it attaches just as severely to [illegible] and to [illegible].—Mr. C. Buller thought it was a [illegible] ominous that the tax, originally proposed for three years, was now spoken of by Sir R. Peel as very likely to last for five, and by no means sure to be removed even at the end of the latter period. Whatever objection was made to the tax, the answer of the Ministerialists was always that the Whigs had [illegible] [illegible] that [illegible]. He thought that such recriminations, even had they been fair, would not be logical; but they were not fair, for the present Ministers were the parties [illegible] [illegible] for many of the very evils now charged on their predecessors. For instance, the Canadian expenses, and the uneasy state of the negotiations about the American boundary; and even in the Indian war they had given a [illegible] sanction by stopping [illegible] of motion against the policy of the late Government regarding India. When the estimates were to be voted, the Conservatives had always recommended an increase of our armaments; and when the postage was to be reduced, they had given [illegible], as the Whigs had done, [illegible]. Why, he would ask, was the Indian war introduced into these debates? Was England to be charged with it? If not, it had no business in the [illegible] of the general debate. The articles on which Sir R. Peel was remitting duties were not such as the poor consumed; [illegible], he maintained, would have been relieved by Lord J. Russell's reduction of duties on corn and sugar. Sir R. Peel, he considered, had done just what was best for the landed interest, [illegible] [illegible] as much of the duty on corn as produced [illegible], without protection. After some further observations in condemnation of the Ministerial measures, the hon. Member concluded by saying that Mr. G. Knight had last night reported to the House what he called the will of the late Government. That was not the real will. The real legacies of that Government had been religious liberty to the Catholics and Dissenters, emancipation to the negroes, municipal freedom to the towns, and freedom of commerce to the whole people; but the [illegible] of that will were those who had been their constant [illegible], and for ten years had used all possible means to defeat them.—Mr. F. [illegible] then rose to speak amid great noise and [illegible], and not being heard moved the adjournment of the debate. [illegible] followed, but no division took place, and Mr. [illegible] continued to address the House. He attributed the [illegible] distress of the country, [illegible] to the Corn-law, [illegible] of the Continent, and warmly supported the interests of agriculture. He thought there might have been a better plan than that of Sir R. Peel, but it was the best that had been [illegible], and he should feel himself bound in duty to give his independent vote in its favour. The debate was adjourned, after some observations from Mr. Masterman, Sir W. James, Lord J. Russell, and Sir R. Peel, who expressed a hope that a division would close the discussion on Wednesday.

Wednesday.—Mr. Hampden took the oaths and his seat for the borough of Great Marlow, pursuant to the decision of the election committee.

On the motion of Lord G. Somerset, Mr. Bankes was discharged from the custody of the Sergeant-at-Arms, without the payment of fees, after Dr. Jackson, his medical attendant, had been examined at the bar in support of the allegation that he had been prevented by indisposition from attending to be sworn as a member of the Wakefield election committee.

On the motion of Mr. Tennant, the committee on the Copyright of Designs Bill was postponed till that day fortnight.

A motion made by Mr. T. Duncombe, that Richard Gibbons, committed to Newgate for alleged perjury before the Great Marlow Election Committee, be reprimanded at the bar and discharged, was, after some discussion, withdrawn.

Mr. [illegible] begged to ask Sir R. Peel whether it was the [illegible] of Government to recommend to the Crown that the [illegible] of a Baronetcy should be conferred on the Lord [illegible], as had been conferred on the Lord Mayor of [illegible], on the occasion of the birth of the Prince of Wales?—Sir R. Peel declined stating to the House the advice he [illegible] to the Crown with respect to the conferring of civil distinctions.

The adjourned debate on the Income-tax was then resumed by Mr. Aldam, who [illegible] opposed the measure, grounding his objection to an Income-tax on its inquisitorial character. Some parts, however, of the Ministerial measure, he said, had his approbation.—Mr. Escott thought that the Income-tax was required by the exigencies of the state, and that there was no [illegible] [illegible] the tariff [illegible] in the [illegible] of [illegible] [illegible] [illegible] affected by the new tariff.—Mr. [illegible] [illegible] said he would have been less disinclined to pass the present measure if the tariff had included the great articles of sugar and corn. The Indian disaster, he thought, was not an argument which Ministers were entitled to use, for the measure had been introduced before that disaster was known. He approved the general principle of the tariff as far as it went, but would not give his vote on behalf of the Income-tax.

Lord Sandon considered that whatever might be the commercial value of the propositions of the late Whig ministry, they were utterly useless as constituting a budget framed to meet an immediate necessity. The question, he thought, was not one of mere peace or war, but of emergency; while our disaster in Affghanistan was not to be measured by the loss of a given number of men, but by its influence over the whole of Asia. The first impression of the whole plan upon the House had been highly favourable; it was not till party had had time to get up objections that a murmur had been raised; and, after all, there had been but a partial discontent.—Sir C. Napier disapproved the Income-tax, but applauded the commercial part of the plan. He felt the severity of the late loss in India; and he trusted that Ministers would not carry on "a little war" there or in China. He was for more [illegible], and less tax. He hoped that when this resolution should have been carried, his own side of the House would offer no further obstruction.—After some remarks from Mr. [illegible] in favour of the Government measure, Mr. O'Connell addressed the House, and said that even though Ireland was exempted from the Income-tax, he would raise his voice against it on behalf of the British people. A Property-tax he would support, for on that point his opinions went almost to an extravagant length. There were, he thought, resources from which the deficiency might be made up, amongst the many taxes which had been repealed. He regretted the exaggerations of our danger in India. Such statements lowered the general opinion of our national strength, and prevented this country from taking the stand that it ought, suitable to her character. He admitted, indeed, that England was in danger, not only from India, but from Europe, and still more from America; but for those very reasons he would reserve the pecuniary resources of the country, lest when the real necessity should come, the people might, in disgust, refuse their aid. After enlarging on the inquisitorial nature of the tax, he concluded by saying that he was for a free trade; but he was for a real, not a bastard freedom: he was for a freedom which would leave the bread of the poor untaxed.

Lord [illegible] observed upon the injustice of imputing to the landed gentlemen that they struggled only for their own interests, and yet that they had deceived their constituents by leaving those interests in the lurch. He knew that there was some alarm about the admission of the duty on live cattle; but he was persuaded that the [illegible] would lead to no such importation as could materially lower the prices of meat in this country.—Mr. Hawes asked, if these apprehensions were unfounded, where then was to come that saving in articles of consumption which Sir R. Peel had said would compensate the Income-tax? The present Parliament, he thought, was legislating on principles quite opposed to those on which its majority had been returned. He [illegible] [illegible] that by the tariff Government were taking a step in the right direction. He considered there were gross inequalities in an Income-tax, which, after all, he said, was a device to maintain powerful monopolies at the expense of the weaker.

Sir J. Graham commented on the failure of the attempt to get up an opposition in the country against the measures of Government, and contended that those measures were wisely adapted to the circumstances of the time. The Income-tax, in conjunction with the tariff, was, he said, accepted by the country as a benefit. The right hon. Baronet then, following the arguments of Mr. C. Buller, in his speech of the previous evening, adverted to the state of our relations with foreign countries, and of our Indian finances. The supplies in time of peace must, he said, be raised within the year; no reduction of expenditure could take place; taxes on consumption were not expedient; and the cabinet were united in opinion that no other resource remained than the imposition of an Income-tax. He concluded by saying that Government had faithfully discharged their duty to the country, without courting popularity, or shutting their eyes to the consequences; and they would stand or fall by their measures.

Mr. F. T. Baring compared the simple and calm language of Mr. Pitt, when proposing his Income-tax, with the exaggerated style in which our present very moderate difficulties were depicted by Government. He warned the House of what would be the result of the imposition of the Income-tax; and reminded members that these debates had in no way interfered with the progress of the tariff, inasmuch as it was only the previous day that the amended edition of it had been produced by Government. He had, he said, been considered a sanguine financier, but he thought he was thrown into the shade by Sir R. Peel, who expected, from his tariff reduction, to be able to dispense with the Income-tax in three or five years. No doubt there could be no tax which would not press unequally; but the Income-tax must be judged by experience, a tax which, at the end of the war, was the very first the people of this country threw off.—Mr. Ferrand said, the working classes of Yorkshire and Lancashire were blessing Sir R. Peel for cheapening food to the poor, and exempting them from taxation; and contrasted this with the conduct of the free-trade manufacturers, who, he said, were reducing wages in proportion to the reduction in the price of provisions.—Lord Worsley said he could neither support the measure of her Majesty's ministers nor the resolutions of Lord J. Russell.—Col. Sibthorp made a few remarks, after which the House divided, when there were—For the bringing up of the report, 308; for Lord J. Russell's resolutions, 202. Majority for Ministers, 106.

Mr. Elphinstone then moved that the debate be adjourned till the following day; but on the remonstrance of Sir R. Peel, in which Lord J. Russell joined, the hon. member withdrew his motion.—After much desultory conversation, chiefly respecting amendments which different members intend to propose, Sir R. Peel, in answer to a question from Mr. Blewitt, said he would bring on the tariff after the second reading of, or at furthest after the committee on, the Income-tax Bill.—Mr. Labouchere deprecated that delay.

Sir R. Peel said that his opponents needed not fear his carrying the tax and then abandoning the tariff; should he be defeated on the main points of his tariff, he should feel it as much his duty to resign as if he were defeated on the tax.—The report was then agreed to, and leave given to bring in a bill founded upon it.

Thursday.—Mr. Redington, the chairman, brought up the report of the Sudbury Election Committee, which unseated the sitting Members, pronounced them guilty of bribery, declared that the election was void, and recommended the disfranchisement of the borough, on the ground of gross, systematic, and extensive bribery. The hon. Member then moved that the Speaker do not issue his warrant to the clerk of the Crown to make out a new writ for the borough of Sudbury before the 7th May.—Agreed to.

On the motion of Mr. J. O'Connell, it was ordered that Mr Mark Blake be discharged from the custody of the Sergeant at-Arms, after some remarks from Lord G Somerset, that Members who failed to attend to their duty on election committees should be charged with the expenses incurred by the parties, in addition to the fees of 25*l.* or 30*l.* on their discharge from custody.—The Speaker announced that the election petitions against the returns for Tipperary and St. Ives had been abandoned.—Lord F. Egerton, pursuant to notice, brought forward a series of resolutions, seven in number, relative to the presentation of petitions to the House. The [illegible] resolution [illegible] provided for the reception of petitions against taxes for the current service of the year; and the seventh proposed that these resolutions should become a "standing order" of the House.—Mr. Wallace objected to the first resolution, which [illegible] the [illegible] practice of discussion on the presentation of petitions, and declared his determination of dividing on it. After a short debate, a division took place, when the first resolution was carried by 268 to 46. The rest of the resolutions were then put, and after some discussion on the last one, which proposed that the resolutions should become a "standing order" of the House, they were carried without a division.

Mr. Wakley made a complaint to the Speaker that his seat, on the previous evening, had been taken possession of by Sir J. Easthope, during his temporary absence.—Sir J. Easthope explained that he was not aware the seat had been taken by the hon. member; and the abrupt manner in which it had been demanded to be given up induced him to refuse.—The Speaker briefly explained the usual practice in such cases, and the subject dropped.

Some unimportant business was then transacted, including permission to Mr. A. Campbell to bring in a bill to regulate the exercise of Church patronage in Scotland, and the considering, in committee, of the Colonial Passengers' bill.

Lord Stanley moved the second reading of the Australian and New Zealand Bill.—After a few remarks from Mr. [illegible] O'Brien, Lord Stanley said that the bill did not extend to the Cape of Good Hope, because the good land there was but a small portion, and [illegible] [illegible] that it was not the intention of Government to interfere, [illegible] [illegible] [illegible], [illegible] [illegible] anticipate the [illegible] fund for many years; and that they did not mean to [illegible] any [illegible] between persons of different religious persuasions, whether Catholics or Protestants.—Mr. [illegible] gave his cordial assent to the second reading of the bill, which was founded on the report of the committee of last year.—The bill was then read a second time.

Friday.—Capt. [illegible], on the third reading of the Mutiny Bill, moved a clause prohibiting corporal punishment in the militia and army during peace, except for offences committed on a line of march, or for theft. A conversation ensued, in which nearly all the military members present joined, when the House divided on the motion, [illegible] [illegible] [illegible] to [illegible]. The House then went into Committee on the [illegible] Corn [illegible] Bill. Mr. Labouchere moved as an amendment that the clause imposing a duty of 1s. the barrel on wheat flour imported across the American border into Canada be omitted, and that the old law, admitting it duty free, be still adhered to. On a division, the amendment was negatived by 62 to 34.

CITY.

Money Market, Friday.—The account in Consols shows a further improvement in price. Consols for money closed at 91⅞ to ½; and for the account, [illegible]; Bank Stock closed 165½ to 166½; Exchequer-bills, 39s. to 41s. premium; Three per Cents. Reduced, 90¾; Three-and-a-half per Cents. Reduced, 99⅞ to ¾; New Three-and-a-half per Cents., 100⅝ to ¾; India Bonds 18s. premium; and India Stock, 241½ to 242½.

Metropolis and its Vicinity.

Metropolitan Improvements.—It is stated that the Commissioners of Woods and Forests have decided on limiting the improvements consequent on the removal of the ranger's lodge in the Green-Park to the formation of a gravel-walk, in continuation of the present one from Hyde-Park-corner, and the substitution of an iron railing and dwarf wall instead of the present brick wall. There is no intention, it is said, of erecting a terrace, as has been reported, from Hyde Park-corner to Devonshire House, on the site of the Green-Park.

Public Meetings.—At a recent meeting of the Council of the College of Surgeons, after the election of the officers for the year, it was announced that the receipts and expenditure for the past year were as follows:—The receipts, including the proceeds of the Court of Examiners, fees on admission to Council and on certificate, amounted to 14,158*l.* 6s. 4d., exclusive of 1,299*l.* 4s. 4d. dividends on investments in Government securities. The disbursements amounted to 14,503*l.* 6s. 5d., of which sum 6,357*l.* 12s. 7d. was expended on the college department, 2,929*l.* 5s. 11d. on the museum department, and 778*l.* on the library department. The permanent income of the college is stated to be 1,2[illegible] 4s. 4d., the incidental 12,8[illegible] [illegible]; while the permanent expenditure is 3,241*l.* 10s. 1d., and the incidental 11,[illegible] [illegible]. The council have resolved that no provincial hospital will in future be recognised by the college, which contains fewer than 100 patients, and no metropolitan which contains fewer than 150 patients.—At a Court of Aldermen held on Tuesday for the despatch of business, the Lord Mayor presented to the Court letters from Sir R. Peel and Sir J. Graham, announcing that her Majesty had conferred on him the rank of Baronet, in consideration of his holding the distinguished trust of Lord Mayor at the period of the birth of the Prince of Wales. The court received the communication with loud cheers. The letters were ordered to be entered on the journals, with the intimation that the court felt highly gratified that Mr. Pirie was the individual upon whom the honour fell.—On Wednesday, a Court of Directors was held at the East India House, when the Marquis of Tweeddale was appointed Governor of Fort St. George. A ballot was then taken for the election of six directors in the room of Mr. H. Alexander; Major-Gen. Sir J. Bryant, C.B.; Mr. W. S. Clarke, Mr. J. Shepherd, Mr. P. Warden, and Sir W. Young, Bart., who go out by rotation. At the close of the ballot, the election was declared to have fallen on Mr. W. Astell, M.P.; Mr. W. B. Bayley, Mr. R. Ellice; Major-Gen. Archibald Galloway, C.B.; Sir R. Jenkins, G.C.B.; and Mr. J. Masterman, M.P.

Exeter Hall.—The first great choral meeting of Mr. Hullah's musical classes was held on Wednesday at Exeter Hall, for the purpose of showing the proficiency which they had acquired by Wilhelm's system. The appearance presented at the commencement of the performances was an imposing one, the body of the Hall being filled by all the male and female vocalists, 1,500 in number, who have followed Mr. Hullah's course of instructions. The orchestra was divided into reserved seats, for the more distinguished portion of the auditors, amongst whom were Prince Albert, the Duke of Wellington, the Archbishops of Canterbury and York, the Bishop of London, and Lord Wharncliffe, under whose sanction, as President of the Committee of Privy Council on Education, these classes were formed. The choruses, which were unaccompanied by any instrument, passed off well and with great precision, and received considerable applause from the crowded audience. Some of the pieces were encored. Prince Albert and the Duke of Wellington took their departure about ten o'clock, and were loudly cheered.

Metropolitan Roads. — We have noticed in former Numbers the subject of the darkness of the Metropolitan roads, in consequence of the discontinuance of the gas-lights by the commissioners, and the steps taken by the different parishes to remedy the evil. In the House of Commons on Thursday, Mr. Borthwick, after presenting a petition from Notting Hill and Kensington in reference to this subject, rose to bring forward a motion of which he had given notice, for leave to introduce a bill to enforce the better lighting of the Metropolitan roads by the respective parishes through which they pass. He thought the present bill was called for in consequence of railroads having diminished the tolls on the ordinary roads to such an extent that the commissioners had no longer the funds sufficient for repairing and lighting the roads. In his opinion, the parishes through which the roads passed, and not the passengers, ought to pay the expense, because the roads added considerably to the value of property in their neighbourhood. Not anticipating any opposition to his motion, he would merely state that he proposed to carry his purpose into effect, by making it compulsory on those parishes to light the roads, and that the inspectors should be empowered to call on the overseers of the poor to make a rate for that purpose. The Speaker asked if he proposed to levy a rate on the several parishes? Mr. Borthwick replied in the affirmative, when the Speaker said that the bill, in that case, would be partly of a public and partly of a private nature, and the hon. member would, therefore, have to give the notice required to be given in cases of private bills. Mr. Borthwick then said that with the consent of the house he would withdraw his motion, and give the proper notice.

University College.—The annual general meeting of the proprietors of this institution has recently taken place, when the report of the council and a statement of the finances of the College were submitted to the proprietors. It appears that in the session ended October last, the number of pupils in the College classes and in the school was 890; viz., in the arts, 145; in medicine, 344; and in the junior school, 401; this being exclusive of the class of schoolmasters, to which 45 students were entered. The fees amounted to 11,840*l.* 9*s.* 5*d.*, out of which there was payable to professors and masters, 8,553*l.* 7*s.* 6*d.*; to the college, 3,287*l.* 1*s.* 11*d.* Adding to this, the dividends on the unappropriated invested funds, profit on Exchequer Bills, and a few other receipts amounting together to 213*l.* 16*s.* 11*d.*, the income of the college was 3,500*l.* 18*s.* 10*d.* The ordinary expenses of the session were 3,255*l.* 18*s.* 1*d.*, and the extraordinary expenses 491*l.* 10*s.* 6*d.*; the whole expenditure thus exceeding the year's receipts by 246*l.* 9*s.* 9*d.* For defraying this balance, incurred in permanent additions and improvements to the property of the college and its means of education, the council had applied temporarily a further portion of the donation of Mr. Brundrett; and, until its repayment, the college is debtor for that amount to the Endowment Fund. Since the last general meeting, the council have instituted professorships of clinical medicine, architecture, and civil engineering. With respect to the examinations, the council reported that in this, as in former years, the large share obtained by students of this college, of the honours and rewards bestowed by the University of London and other examining bodies, has testified to the excellence of the course of instruction. Of five exhibitions, four were gained by them, as well as the three medical scholarships, and eleven out of fourteen gold medals. Of the prizes offered by the Society of Apothecaries for the examinations in botany and materia medica, the gold medal for the former was obtained by Mr. Preston; and that for the latter, by Mr. A. B. Garrod; and one of the two silver medals was awarded to Mr. J. Thompson—students of this college. Another student, Mr. W. A. Hillman, was the successful competitor for the scholarship in comparative anatomy, founded by the Royal College of Surgeons. After some further remarks on the financial affairs of the institution, the report concluded by congratulating the proprietors on the present condition of the college, and its prospects of advancing prosperity.

Accidents.—A fatal accident occurred in Hyde Park on Thursday, to Robert Burton, Esq. It appears that he was riding a high-spirited horse, when by some accident he was thrown, and fell upon his head, by which concussion of the brain was produced. He was taken to St. George's Hospital, where he died shortly after. The deceased gentleman was an intimate friend of Prince George of Cambridge, who called at the Hospital soon after Mr. Burton had been taken there, for the purpose of inquiring after him; and this circumstance gave rise to a rumour that the accident had occurred to his Royal Highness himself.

Police.—The murder committed at Roehampton, noticed in our last, has continued to create, during the week, considerable excitement in the Metropolis, both on account of the circumstances attending it, and from the fact that the murderer has hitherto succeeded in evading the hands of justice. A variety of rumours have been current respecting him, and accounts of his having been seen in different places in the Metropolis and its neighbourhood; but though a reward of 150*l.* has been offered for his apprehension, and every exertion has been made by the police to trace him, no clue to his place of retreat has yet been discovered. An inquest has been held, which lasted three days. A number of witnesses were examined, whose united testimony proved that the body discovered was that of a female named Jane Jones, residing at South Street, Manchester Square, the reputed wife of Daniel Good. At the close of the inquiry, the jury returned the following special verdict:—"We find that the human body found on the premises of Mr. Sheill, in the parish of Putney, is that of Jane Jones, otherwise Jane Good,—that she was in good health at the time of her death, and that Daniel Good did wilfully murder her." The Coroner then bound the witnesses in heavy recognizances to appear at the trial, and issued a warrant for the committal of the murderer, whenever his apprehension can be effected.

Strawberry Hill.—The interest felt by the public with respect to the approaching sale of Horace Walpole's collection of curiosities and works of art at Strawberry Hill continues unabated, as is evidenced by the number of visitors who still crowd the house for the purpose of viewing its interesting contents. Among the valuable manuscripts included in the collection, we learn by the morning papers that a discovery has been made during the past week which is of interest to the statesman and the historian. More than sixty boxes of papers, inscribed "secret and important," have been found, and are said to consist of letters, which James, the first Earl of Waldegrave, wrote to the Ministers of his day. It is added that the rumour of this discovery having been communicated to Government, an official character belonging to the State Paper Office has been sent down to stop the sale until these documents are surrendered for the archives of the State.

Mortality of the Metropolis.—The following is the number of deaths that have occurred in the Metropolis from all causes, registered in the week ending Saturday the 2d inst.:—Total number, 832; average total weekly deaths in 1841, 912.

Provincial News.

Brighton.—It has been stated that among the numerous sufferers by the failure of Messrs. Wigney's bank in this town, the Queen was a loser to the extent of nearly 10,000*l.*, that sum having been deposited by Sir H. Wheatley, Keeper of the Privy Purse, a few days previously to the Bank's suspension of payments; but the report has been contradicted on authority.

Cambridge.—A local paper informs us that arrangements are in progress for the installation of the Duke of Northumberland as Chancellor of this University, which will take place at the ensuing commencement, unless some unforeseen event should lead to its further postponement. The Duke of Wellington and Lord Lyndhurst, it is added, have signified their intention of honouring this city with a visit on the occasion; and it is expected that a number of other eminent persons will also be present.

Liverpool.—A case has come before the magistrates of this town, which, from the unusual nature of the charge, and the singular disclosures made during the investigation, has excited much interest. It has been pending for some days, but we deferred noticing it until the result was known. The charge was one of abduction brought by a Miss Crellin against eight persons, Messrs. M'Gill, Jones, Quick, Rogerson, Duval, and Dunlevy; Mrs. Jones, and Mrs. Clayton. It appears that a plan was arranged by the prisoners to bring about a marriage between the prosecutrix, who is represented as possessed of considerable property, and the prisoner, M'Gill, who is said to be a medical man. It is stated that being unable to prevail on the prosecutrix to meet their views, they made her intoxicated while on a pleasure excursion, and having drugged what they gave her to drink, conveyed her in a state of insensibility to Gretna Green, where she was married to the prisoner, M'Gill, without her knowledge: that on being informed the following day, when she had recovered, of what had occurred, and finding a wedding ring on her finger, she insisted on having it removed, though it had to be filed off, and afterwards brought the present charge of abduction against the prisoners. A man named Copeland was at the same time charged with having defrauded Miss Crellin of 250*l.* It seems he had some time previously made offers of marriage to Miss Crellin, by whom his suit had been favourably received; but when it was proposed that the marriage should take place, Miss Crellin insisted on having all her property first settled on herself, to which Martin objected, and the match was in consequence broken off. He, however, threatened to bring an action for breach of promise of marriage, and working on Miss Crellin's fears, by the assistance of the prisoner, Mrs. Jones, succeeded in extorting 250*l.* from her. During the inquiry, which lasted seven days, a great many witnesses were examined, and sufficient evidence was adduced to lead the magistrates to commit all the prisoners to take their trial for the offence; M'Gill, Quick, Jones, and Mrs. Clayton for felony, as principals in the abduction; and Rogerson, Mrs. Jones, and Duval, for felony, as accessories. Copeland is committed for the fraud, and Mr. Dunlevy, who stands charged with being implicated in the conspiracy, having been present on the occasion of the marriage, was admitted to bail, to appear at the assizes to answer any bill of indictment that may be preferred against him.

Newton.—A serious explosion, whereby seventeen lives were lost, has taken place in the coal-pit worked by Messrs. Swere and Co., at Flowery Field, near Hyde, Cheshire. As soon as it was safe to descend, exertions were made to rescue those that were alive, when 25 men were found, seventeen of whom were dead, and the remaining eight so seriously injured, that, with one exception, little hopes are entertained of their recovery. An inquest was held in this town on Monday, when from the evidence it appeared that there were 66 men and boys in the mine at the time of the explosion; 25 being at work in the part where the explosion took place, all of whom, as stated above, were either killed or seriously injured. Little light, however, was thrown on the origin of the accident. Some of the witnesses attributed it to the falling in of a portion of the roof of the mine, and an escape of foul air in consequence, which coming in contact with the lighted candles, at once caused the explosion. Others referred it to a collection of foul air in an unfrequented part of the mine, which ignited on one of the workmen going to the place with a lighted candle.

Southampton.—On Monday, a special general meeting of the shareholders of the Southampton Dock Company was held for the purpose of considering a plan to complete the company's capital, by a sale of forfeited shares, and by the issue of debentures or otherwise, subject to the provisions of an Act of Parliament to be applied for, and also for the forfeiture of shares. The chairman, Mr. Liggins, stated that having failed in the accomplishment of the objects contemplated in their bill, through a noncompliance with the standing orders, the directors had prepared another plan, which he had no doubt would be equally approved by the shareholders, as it would effect a saving of at least 50,000*l.* in comparison with the former proposal. The secretary explained the scheme for raising the 100,000*l.* (to complete the original sum of 350,000*l.* for both docks), which was to re-issue about 1,800 forfeited shares, and an equal number of debentures, the former to be fixed at 20*l.*, and the latter at 30*l.* each, no call to exceed 10*l.* on each share and debenture, three months at least to intervene between each call, and an equal number of shares and debentures to be taken in conjunction, to bear an interest of five per cent., with option to the subscribers after five years if not repaid, of converting each share and debenture into 50*l.* stock of the company. On the chairman moving that the directors be authorised to take the necessary steps to carry the above scheme into effect, Mr. Richards spoke strongly on the management of the company, the excess in the estimate against the engineer, on the want of security with the present contractors, and the evils of the truck system. The secretary said that 10,000*l.* had been paid to the contractors out of the last 51,000*l.*, which latter amount Mr. Giles, the engineer, said would complete the tidal dock by Midsummer. After some discussion, the resolution was carried by a large majority. An additional forfeiture of 316 shares then took place.

Railways.—The following are the receipts of railways for the past week:—Birmingham, 14,903*l.*; Great Western, 11,858*l.*; Brighton, 2,740*l.*; Blackwall, 760*l.*; Birmingham and Gloucester, 1,662*l.*; Hull and Selby, 940*l.*; Eastern Counties, 829*l.*; Manchester and Birmingham, 336*l.*; Greenwich, 1,594*l.*; Northern and Eastern, 1,090*l.*; South-Western, 5,610*l.*; Birmingham and Derby, 1,098*l.*; North Midland, 3,886*l.*; Great North of England, 1,273*l.*; Midland Counties, 2,479*l.*; York and North Midland, 1,570*l.*; Edinburgh and Glasgow, 1,637*l.*—An accident, attended with fatal consequences, has occurred on the Eastern Counties Railway, at the works near Stanway, a few miles from Colchester, by the falling of a large mass of earth upon an excavator. It seems there were several men employed at the spot at the time, all of whom contrived to escape except deceased, who when dug out was found to be quite dead. An inquest was held, and a verdict of "Accidental death" returned. A serious accident has taken place on the North Union Railway, whereby a policeman lost his life. It seems that some persons passing along the line near the town of Capel found him lying, severely wounded and apparently dead, between the rails. He was taken up, and conveyed to the Capel station, where he died in a few minutes afterwards. From the evidence adduced at the inquest, there was reason to suppose that he met with the accident from a luggage-train that passed along the line a few minutes before he was discovered. Verdict, "Accidental death."—On Sunday, a serious accident occurred on the Northern and Eastern Railway to Mr. Layer, a master drover and butcher of Fakenham, Norfolk. It appeared that he had accompanied his men with a large drove of beasts on their way to Smithfield; and one of the oxen becoming tired, he put it into a truck on one of the trains, and proceeded with it himself. The beast, however, was frightened at the sound of the whistle of the engine, and becoming restive, kicked Mr. Layer out of the truck at the time the train was going at full speed, whereby his skull was fractured, and he received other serious injuries. He was conveyed to the London Hospital, where he lies in a hopeless state.

IRELAND.

Dublin.—His Excellency the Lord Lieutenant and the Countess de Grey have taken their departure for London, where they are expected to remain about a month. Her Majesty's letters patent have passed the Great Seal, appointing the Lord Chancellor, the Archbishop of Armagh, and Sir Edward Blakeney, K.C.B., Lieut.-Gen. commanding the Forces in Ireland, as Lords Justices during his Excellency's absence.—An inquest has been held on Sir Ross Mahon, Bart., whose sudden death we noticed in our last, when, from the medical evidence, it appeared that deceased died from congestion of blood on the brain. The jury returned a verdict accordingly.—A serious accident has happened to Sir E. Blakeney. It appears that while on a visit at Woodlands, the seat of Col. White, he expressed a wish to see a favourite grey charger, which he had some time previously presented to Col. White, and on going into the stable, he approached the horse, as he had been accustomed to do, familiarly; but the animal suddenly turned round and seized Sir Edward by the jaw, lacerating him severely. He proceeded home in his carriage, and the Surgeon-General, Sir P. Crampton, being called in, dressed the wound: and the latest accounts state that Sir Edward is going on as favourably as the nature of the accident will admit of.—Dr. Saurin, bishop of Dromore, expired on Saturday evening, at Kingstown. The decease of this prelate gives the revenues of another see to the ecclesiastical commissioners. Eight of the ten bishoprics suppressed by Lord Stanley's bill have been thus disposed of. They are the dioceses of Cork, Waterford, Ossory, Clonfert, Killala, Elphin, Raphoe, and Dromore. The two remaining bishoprics are Kildare, which, upon the demise of the present bishop, is to be united to Dublin, and Clogher, which is to be united to Armagh.—The disposition to emigrate is said to be very general at present in all parts of Ireland, more particularly in the northern provinces, in Munster, Clare, Kerry, Cork, Tipperary, and Waterford, where great numbers, chiefly consisting of small agriculturists, are constantly embarking for America and the Canadas.

Queen's County.—The stoppage of the firm of Messrs. Beale and Co. at Mountmellick, noticed in our last, appears to have produced considerable distress not only in the town and immediate neighbourhood, but to have spread general alarm throughout the counties of Galway and Roscommon, where the firm carried on an extensive traffic in the purchase of wool, and to be felt in its consequences from Clare and Limerick to Mayo. The individual losses are said to vary in amount from 300*l.* to 3,000*l.* Although, however, the liabilities of the firm are understood to be very great, the assets are stated to be considerable, and hopes are held out that the concern will be able to wind up its affairs satisfactorily, and shortly resume business.

SCOTLAND.

Dundee.—The spirit of emigration appears to be rife in this country; and every fresh emigrant ship for America takes out a great number of passengers. A few days since, a large vessel left this port for New York, with 140 passengers, and two more have sailed for Canada, one with 40 and the other with 18 passengers, most of whom are said to belong to the working classes. Another vessel sailed from the Broomielaw, Glasgow, on Tuesday, for Montreal, with a considerable number of emigrants.

SPORTING.

Newmarket First Spring Meeting.—These races commenced on Monday; and though the weather has been cold and unpropitious, the attendance of company was good, and the races went off with spirit. They commenced with

The Craven Stakes of 10 *Sovs. each, A. F.* (8 *Subs.*)—Duke of Richmond's The Currier (Rogers), 1; Mr. Ford's Heads or Tails, 2. The following also started, but were not placed: Mr. Osbaldeston's The Mountain Sylph, Duke of Grafton's Florence, Mr. Batson's Barbara, Lord Albemarle's Minaret, Capt. Daintree's b. c. by Mulatto, dam by Middleton, and Mr. Pettit's Michaelmas Day. Betting: 5 to 2 agst Florence, 7 to 2 agst Mountain Sylph, and 5 to 1 agst Barbara. Florence was first from the post, and led for a quarter of a mile; she was then passed by Heads or Tails, who, overpowering the lad, made strong running into the cords, where the Currier drew upon her, headed her half-way up, and won cleverly by a length; the third and fourth were very well up.

Handicap Sweepstakes of 20 *Sovs. each. D. M.* (8 *Subs.*)—Mr. Rogers's Tiptoe (Casidy), 1; Lord Albemarle's Buffalo, 2; Lord Orford's Young Quo Minus, 3; Lord Exeter's Scarf, 4; Duke of Portland's c. by Mundig, out of Thebes, 5; Duke of Grafton's Lisburn, 6; Lord Kelburne's c. by Muley Moloch, d. by Actæon, 7. Betting: 6 to 4 agst Tiptoe, 4 to 1 agst Scarf, 5 to 1 agst Buffalo, 7 to 1 agst the Thebes colt, and 7 to 1 agst Lord Kelburne's colt. Tiptoe jumped off with the lead, made all the running, and won easily by two lengths, the intervals between the others being wide enough to enable the Judge to place them all.

Handicap Sweepstakes of 25 *Sovs. each. T. Y. C.* (3 *Subs.*)—Mr. Thornhill's Menalippe. Walked over.

The Tavistock Stakes of 100 *Sovs. each. D.M.* (4 *Subs.*)—Lord Stradbroke's c. by Jerry, out of Marpessa (Nat), 1; Lord Albemarle's Robin, 2. Betting: 2 to 1 on Robin (taken), who led till near the cords, where the Jerry colt headed him, and won easy by a length.

The Riddlesworth Stakes of 200 *Sovs. each. Ab. M.* (11 *Subs.*)—Mr. Greville's Gunter by Bay Middleton (Nat), 1; Colonel Anson's The Puncher, by Bay Middleton, 2; Mr. Thornhill's Eusebia, by Emilius, 3; Mr. Bowes's The Lady of Silverkeld Well, 4. Betting: 6 to 5 agst Eusebia. The Puncher made the running to the bushes, where the others closed with him, and they ran together a short distance; half-way down the hill Gunter went in front, and won easy by two lengths; about the same space separated the others. The pace was good.

Tuesday. The Coffee-room Stakes of 50 *Sovs. each. R.M.* (*Six Subs.*)—Lord Orford's c. by Jerry out of Petulance (Nat), 1; Lord Chesterfield's c. by Muley Moloch, out of Dirce, 2; Lord Exeter's Revocation, by Reveller, 3; Mr. Batson's ch. c. by Plenipotentiary, Acacia, 4; Lord Albemarle's Robin, 5. Betting: 5 to 4 agst Dirce colt; 4 to 1 agst the winner (taken), 4 to 1 agst Revocation; 4 to 1 agst the Acacia colt, and 10 to 1 agst Robin. The Dirce colt made all the running, Revocation and the Petulance colt waiting on him. Revocation gave up at the top of the hill; and the Petulance colt, challenging in the bottom, caught the favourite on the post, and won by a head. Nothing else was up. The pace was good.

The Riddlesworth Stakes of 200 *Sovs. each. D.M.* (3 *Subs.*)—Col. Peel's Chatham, by the Colonel, walked over.

The Second Grillion Stakes of 50 *sovs. each. R.M.* (5 *Subs.*)—Mr. Thornhill's Equation, sister to Euclid (Pettit) 1; Mr. Batson's f. by Jerry, out of Revelry, 2; Lord Albemarle's Dorothy, 3. Betting: 5 to 2 on Equation, who made nearly all the running, and won easy by a length.

The Oatlands Stakes of 50 *Sovs. each. D.I.* (4 *Subs.*)—Duke of Rutland's The Genius, and Lord Kelburne's b. c. by Muley Moloch, d. by Actæon, divided the stakes, and Lord Kelburne's colt walked over.

Sweepstakes of 200 *Sovs. D.M.* (3 *Subs.*)—Mr. Thornhill's Equation, 8 st. 10 lb., walked over.

Sweepstakes of 100 *sovs. each. R.M.* (9 *Subs.*)—Duke of Grafton's Canadian, by Jerry (J. Day), 1; Mr. Faulconer's Astronomer (allowed 3 lbs.), 2; Lord Orford's Adelgund, by Bay Middleton (allowed 3 lbs.), 3. Betting: 11 to 8 on Canadian, 5 to 2 agst Adelgund. Canadian, who ran very awkwardly throughout, made play nearly the whole of the distance, and won easily by a length; Adelgund was beaten off. The pace was good for half a mile only.

Sweepstakes of 100 *Sovs. each, D.M.* (6 *Subs.*)—Lord G. Bentinck's b. c. Tedworth (Rogers), 1; Fulwar Craven's Don't-say-No, 2; Lord Orford's c., by Emilius, out of Wild Duck, 3. Betting: Even on Tedworth, 5 to 4 agst the Wild Duck colt. Won easy by a length; a fine race for second.

WEDNESDAY.—*Sweepstakes of* 100 *sovs. each. T.Y.C.* (5 *subs.*)—Mr. Thornhill's Espartero, by Emilius, walked over.

Subscription Plate of 50*l. T.Y.C.*—Mr. Byng's Garry Owen, 0; Mr. Thornhill's Eringo, 0. The following also started: Mr. Rush's ch. f. by Plenipotentiary, out of Obelisk's dam; Lord Exeter's Patchwork; Mr. Barnes's br. c. by Emilius, out of Benefit's dam; and Mr. B. Greene's ch. c. by Wiseacre, out of Zany's dam. Betting: 6 to 5 agst Garry Owen, 5 to 2 agst Eringo, 4 to 1 agst the Wiseacre colt, 6 to 1 agst Patchwork. A dead heat between Garry Owen and Eringo.

The Column Stakes of 50 *sovs. each. R.M.* (30 *Subs.*)—Lord G. Bentinck's Flytrap, by Bay Middleton (Rogers), 1; Mr. Batson's c. by Plenipotentiary, out of Acacia (allowed 3 lbs.), 0; the Duke of Portland's f. by Bay Middleton, out of Souvenir (allowed 3 lbs.), 0. The following also started: Lord Orford's f. by Clearwell, out of Chapeau d'Espagne's dam (allowed 3 lbs.); Mr. Thornhill's Eusebia, Col. Peel's Archy, and Lord Chesterfield's b. f. by Muley Moloch, out of Young Petuaria (allowed 3 lbs.). 7 to 4 on Flytrap, won by a head; a dead heat for second between the Acacia colt and Souvenir filly. Archy was a good fourth, and the others beaten off.

THURSDAY.—*Sweepstakes of* 100 *Sovs. each. D. M.* (15 *Subs.*)—Duke of Grafton's Canadian, by Jerry (J. Day), 1; Mr. Gregory's Barrier, bro. to Bulwark, 2; Mr. Pettit's Espartero, by Emilius, 3; Col. Peel's Chatham, by The Colonel, 4; Mr. Goodman's Rover, by Muley Moloch, 5. Betting—6 to 4 agst Chatham, 5 to 2 agst Barrier, 4 to 1 agst Canadian, and 6 to 1 agst Espartero. There was one false start, in which Chatham fell, rolled over Nat, and broke his collar bone; unaware of the extent of his hurt, Nat remounted, and rode him in the actual race. Barrier made the running at a steady pace, followed by Canadian and Chatham to the T.Y.C. post, where the latter was beaten, and Espartero took the third place. Canadian challenged at the ropes, and after a tolerable race won cleverly by a length; Espartero was a bad third, and Chatham beaten off. Rover gave in before he had run half the distance. The betting was heavy. Offers to take 15 to 1 about Canadian for the Derby.

Sweepstakes of 200 *Sovs. each. D. M.* (7 *Subs.*)—Col. Peel's Archy, by Camel (Chapple), 1; Duke of Beaufort's c. by Camel, out of Miss Craven's dam, 2; Lord G. Bentinck's Flytrap, 3; Lord Exeter's Albion, 4; Lord Chesterfield's Johnny Faa, 5. Betting—5 to 4 agst Flytrap, 3 to 1 agst Johnny Faa, 3 to 1 agst Duke of Beaufort's colt, and 5 to 1 agst Archy. The Duke's colt made all the running, followed by Flytrap and Archy to the ropes, where Archy passed Flytrap, caught the roan half way up, and won cleverly by a length; Flytrap a good third.

BETTING AFTER THE RACES.

Sweepstakes on Thursday.—Chatham was backed heavily at 2 to 1, 7 to 4, and 6 to 4, p. p.; and 1,000 to 10 and 1,000 to 15 (taken) that he wins it and the Derby.

DERBY.

17 to	1 agst	Lord G. Bentinck's lot (taken)	30 to	1 agst	Chatham
			50	1	Canadian
8	1	Attila	50	1	Policy
10	1	Frederica colt (taken)	50	1	Agreeable colt
16	1	Auckland (taken)	1000	15	Tripoli (taken)
23	1	The Lord of Holderness	1000	15	Master Thomas (taken)
25	1	Joanna colt (taken)	1000	15	William le Gros (taken)
30	1	Eleus (taken)	1000	10	Misnomer colt (taken)

OAKS.

8 to 1 agst Adela filly (taken) | 12 to 1 agst Dil-bar (taken)

14 to 1 agst Syren (taken)

Miscellaneous.

New Process of Dyeing.—A French paper informs us that the Russian Government has purchased for the sum of 1,000,000 roubles a new process of dyeing blue, by means of which the price of dyeing a piece of cloth is reduced to six francs from 32. M. Casimir Périer, the French Minister at St. Petersburgh, was in treaty with the inventor for the acquisition of his discovery, which would "have freed France from the tribute which she pays yearly to both Indies for indigo."

Gratitude of a French Lady. — Mademoiselle de la Champagne, a French lady of property, who recently died in the town of Avranches, in Normandy, bequeathed 1,200*l.* to the British nation, in grateful acknowledgment of the liberality and kindness which she had experienced from the Government and people of England during her residence there as an emigrant at the time of the Revolution. The Mayor of Avranches solicited permission of Sir R. Peel for the application of the money towards building a ward in the town hospital, to be appropriated to the relief of British sailors shipwrecked on the coast, or of other destitute English persons. The Premier consented. This spirit we should ever wish to see cultivated by both nations.—*Times.*

New Steam Frigate.—The Admiralty have given instructions for the building and equipment of a new steam frigate, which, it is said, will surpass in size and power everything of the kind yet afloat. She is to be of 650 horse power; to have engine-room for 600 tons of fuel; complete stowage under hatches for 1,000 troops, with four months' stores and provisions, exclusive of a crew of about 450 men; and is to be armed with 20 guns of the heaviest calibre, besides carronades. The Cyclops, Gorgon, Geyser, and other war-steamers of the first class, which have hitherto been regarded as remarkable for their magnitude, will be little more than half her size. The vessel is expected to be fully completed and ready for sea before the close of the present year.

Preservation of Iron.—Mr. Tregelles, of Neath Abbey, says he has found that coal-tar, mixed with one-third its weight of quicklime, and then boiled and used hot, protects iron in a surprising manner from the action of sea-water.—*Carmarthen Journal.*

Statistics of the United States.—A document of considerable interest, entitled the "Aggregate of the Statistics of the United States on the 1st June, 1840, taken by the Marshals in pursuance of order from Congress," has lately been published in the American Papers. The following general abstract of those portions which are included under the heads of Agriculture and Horticulture have been selected from it, and will perhaps prove interesting to our readers:—In the table of agriculture, the item of live stock is placed first: and according to this there were 4,355,669 horses and mules, 14,971,586 neat cattle, 19,311,374 sheep, 26,301,293 swine; while poultry of all kinds is estimated at 9,344,410 dollars. The wheat produced was 84,823,272 bushels; barley, 4,161,504 bushels; oats, 123,071,341 bushels; rye, 18,645,567; buck wheat, 7,291,743 bushels; and Indian corn, 377,531,875 bushels. The crop of wool yielded 35,802,114lb.; the crop of hops, 1,238,502lb.; the crop of wax, 628,303½ lb.; the crop of potatoes, 108,298,060 bushels; the crop of hay, 10,248,108¾ tons; the crop of hemp and flax, 95,251¾ tons; the crop of tobacco, 219,163,319lb.; the crop of rice, 80,841,422lb.; the crop of cotton, 790,479,275lb.; and the crop of silk cocoons, 61,552¼lb. The manufacture of sugar was 155,110,809lb.; 5,088,891 cords of wood sold, and the products of the dairy were in value 33,787,008 dollars. The value of the products of the orchard were 7,256,904 dollars; the manufacture of wine produced 124,734 gallons; and the value of family goods was 29,023,380 dollars. The table of horticulture comprises the value of the produce of market gardens, which is estimated at 2,601,196 dollars, and the value of the produce of nurseries and florists estimated at 593,534 dollars.

Logan Rock.—We learn from the "Cornwall Gazette" that this great natural curiosity, after being kept for the last several years by means of chains and props from falling off the rock on which it stands, is once more brought back to its former position. It appears that it had been gradually wearing away the part on which it stood until it had become a foot distant from its own basis. By the ingenious adaptation, however, of four screws, invented by Messrs. James Tregurtha and J. Hutchens, of the village of Treene, the rock has been forced back to its original place, and may now, it is said, be moved with greater facility than before, and with equal safety.

The Income Tax.—During one of the recent discussions in the House of Commons on the subject of the proposed income-tax, Sir R. Peel stated that the rules by which it was proposed to ascertain the incomes derived from trades and professions would be found in the Income Act of 1806. By reference to that bill the following appears to be an abstract of the rule which applies to trades, and which may be interesting to some of our readers:—1st. The duty to be charged shall be computed on a sum not less than the full amount of the balance of the profits of such trade, upon a fair and just average of three years, ending on such day of the year immediately preceding the year of assessment on which the accounts of the said trade shall have been usually made up, or on the 5th April preceding the year of assessment: provided also, that in cases where the trade shall have been set up and commenced within the said period of three years, it shall be lawful to make the computation for one year, on the average of the balance of the profits and gains from the period of first setting up the same. 2d. The said duty shall extend to every person or persons, bodies politic or corporate, fraternities, fellowships, companies or societies, and to every art, mystery, adventure, or concern carried on by them respectively, in Great Britain or elsewhere. 3d. In estimating the balance of profits and gains no sum or sums shall be set against or deducted from such profits or gains, on account of any sums expended for repairs of premises occupied for the purpose of such trade, nor for any sum expended by them for the supply, or repairs, or alterations of any implements or articles employed for the purpose of such trade beyond the sum usually expended for such purposes, according to an average of three years preceding the year in which such assessment shall be made; nor on account of loss not connected with or arising out of such trade; nor on account of any capital withdrawn therefrom; nor for any sums employed or intended to be employed as capital in it: nor for any capital employed in improvement of premises occupied for the purposes of such trade; nor on account or under pretence of any interest which might have been made on such sums if laid out at interest; nor for any debts, except such debts, or such parts thereof, as shall be proved to the satisfaction of the commissioners respectively to be irrecoverable and desperate; nor for any average loss beyond the actual amount of loss after adjustment; nor for any sum recoverable under an insurance or contract of indemnity. 4th. In estimating the amount of the profits arising as aforesaid, no deduction shall be made on account of any annual interest, or any annuity, or other annual payment payable out of such profits, except the interest of debts due to foreigners not resident in Great Britain, or in any of her Majesty's dominions.—In the case of professions, &c., the following rules will apply:—1st. The duties on employments shall be construed to extend to every employment, by retainer in any character whatever, whether such retainer shall be annual, or for a longer or shorter period; and to all profits and earnings of whatever value, subject only to such exemptions and allowances as are elsewhere provided by the act. 2. The duty to be charged shall be computed at a sum not less than the full amount of the balance of the profits of such professions, after making such deductions, and no other, as are allowed by the act, within the preceding year, ending as in the first case, to be paid on the actual amount of such profits, without any deduction, subject to the like provisions as are made in the first case in respect of the period of average, in the cases of setting up and commencing such profession, within the period herein limited. 3. The third and fourth rules in the first case shall also extend to the profits arising under the second case, as far as they are applicable.

The Amended Tariff.—The new commercial tariff, with the changes to which Government has been induced to accede by the representations and suggestions of those parties who have a practical acquaintance with the subject, was laid upon the table of the House of Commons on Monday night. Among these changes, which are few in number, the following are those which have been made in the articles which more immediately interest our readers:

FRUIT, viz.—Raw, and not otherwise enumerated, for every 100*l.* value, Foreign, 5*l.* Almonds, not Jordan, nor bitter, the cwt., foreign, 10s. Jordan, do., Foreign, 1*l.* 5s.; Bitter, do., Foreign, 2s. Apples, raw, the bushel, Foreign, 6d.; British, 2d. Dried do., Foreign, 2s. 6d.; British, 1s. Currants, the cwt., Foreign, 1*l.* 2s. 2d. Dates, do., Foreign, 10s. Figs, do., Foreign, 15s. Grapes, for every 100*l.* value, Foreign, 5*l.* NUTS, viz.—Chesnuts, the bushel, Foreign, 2s. Cocoa-nuts, the 1,200, British, 1s. Small Nuts, the bushel, Foreign, 2s. Walnuts, do., Foreign, 2s. ORANGES and LEMONS same as in the first tariff, with the exception that the duty on those of Foreign and British production are the same. PEARS, raw, the bushel, Foreign, 9d.; British, 3d. Dried do., Foreign, 3s. 9d. Plums (commonly called French Plums) and Prunelles, the cwt., Foreign, 1*l.*; Dried or Preserved do., Foreign, 1*l.* 7s. 6d. Raisins, the cwt., Foreign, 15s.; British, 7s. 6d. The duties on Linseed, Flax-seed, Mustard-seed, &c., will be reduced considerably more than was proposed in the original schedule of the tariff.

Law.

HOUSE OF LORDS.—APPEALS.—*Gurly* v. *Gurly.*—This was an appeal against a decree of the Lord Chancellor of Ireland, made in a case in which the question was as to the effect of the words of a will, which, construed in one way, disinherited the heir of the testator, and would pass certain freehold estates from him to devisees; and construed in another way, would not produce any such effect. There was a further question as to the effect of certain words in a settlement on a marriage in 1783, barring the testator's wife from her right of dower. The judgment of the court below was affirmed with costs.

JURY COURT, EDINBURGH.—*Robert Hislop, &c.* v. *Sir P. C. H. Durham, K.C.B.*—The action was directed at the instance of Robert Hislop, the father of Elizabeth Hislop, and her brother and sisters, against Sir P. C. H. Durham, on the ground that he had neglected to place a sufficient fence round the mouth of an old coal-pit; in consequence of which the young woman Elizabeth Hislop, while on her way home one night towards her father's house at Hinnybole, near Bonnyrigg, had fallen down the shaft of the said pit and was killed. For the defence it was urged that deceased was intoxicated at the time; and that she had not fallen accidentally into the coal-pit, it not being situated on any road leading to Hinnybole from the place where deceased on the night in question had parted from some companions with whom she was last seen, or on any public road at all, but was situated a little off a private road on the farm of Hopefield, quite in the opposite direction from Hinnybole: that, in fact, she could not have entered the grounds in which the pit was situated without committing a trespass. That, in addition to this, the pit was protected by a framework, called a crib or cradle, which, in place of being in a very insecure state as represented by the pursuers, was perfectly sufficient to prevent all risk of accident. The Lord President, in charging the jury, stated that the law of the case was with the pursuer; but the facts were very contradictory, and it was for the jury to dispose of them. The jury returned a verdict for the pursuer, Robert Hislop, the father—Damages 300*l.*

ASSIZE INTELLIGENCE.—*Doe dem. the Earl of Orford* v. *Sir William Kemp, Bart., and another.*—This was an action of ejectment, to recover possession of a farm of some value in this county. It appears that the Earl of Orford, being anxious to dispose of some estates in this county, entered into a negotiation with Sir William Kemp for that purpose. Not being able, however, to agree upon the purchase-money, the matter was dropped, but that portion of the estates comprised in this action was let by parol to Sir William Kemp for fourteen years, on the understanding that six months' notice to quit should be taken by the tenant in the event of the earl meeting with a purchaser. This state of things did not long continue before the contemplated change was rendered necessary, and notice to quit was accordingly served on the co-defendant of Sir William, his brother, who had occupied the farm under him, and to whom, as the lessor of the plaintiff contended, it had been let conjointly with Sir William Kemp. The question now submitted to the jury was whether Sir William was sole tenant of this farm, or jointly interested therein with his brother; for in the former instance the notice to quit was insufficient for the purpose of determining the tenancy, inasmuch as it was served on the brother alone; while on the other hand such a service would be binding upon both parties, if both were equally concerned in the occupation of the property. The steward of the noble earl was examined upon this point, but his evidence was very vague even in his examination in chief as to the terms upon which he had let the farm to Sir William Kemp, while on cross-examination enough was elicited to place the affair in a point of view consonant to the position of the defendants.—Verdict, accordingly, for the defendants.

The Apothecaries' Company v. *Roberts.*—This was an action by the Apothecaries' Company to recover several penalties from the defendant, a druggist, living at Cheltenham, for dispensing drugs and medicines as an apothecary, in contravention of the statute. The counsel for the plaintiffs stated the nature of the case against the defendant, admitting that Mr. Roberts was a respectable person, and that he had probably acted under a mistake as to the construction of the statute regulating the practice of apothecaries, and the effect of a similar case decided in the Queen's Bench in May last. The counsel for the defendant stated that after the candid statement of the plaintiff's counsel, he would not resist a verdict against his client: and a verdict was accordingly taken for one penalty, the defendant undertaking not to persist in dispensing medicines in future, and the plaintiffs agreeing not to issue execution in the mean time.

Stockport Riots.—Eleven privates in the 21st Reg. of Foot were indicted for a riot at Stockport, on the 28th ultimo, the particulars of which were given in this Paper at the time. It appeared from the evidence adduced on behalf of the prosecution, that on the evening of the 28th March a number of soldiers assembled in the streets of Stockport, in consequence, as is supposed, of some of their comrades being taken into custody on a charge of disorderly conduct, that they proceeded, armed with thick sticks, to several public houses, inquired for the police, against whom they made threats, and attacked the inhabitants, but particularly those whom they found in two public-houses, one called Cox's Vaults, and the other the Pack Horse. There were about forty who took part in the disturbance; and on their meeting a gentleman in the street, whom they took to be the superintendent of the police, they beat him severely. A number of witnesses were called to identify the prisoners, some of whom spoke to being struck with a bayonet, which was broken in the tumult; while on the other hand a great many witnesses were called by several of the prisoners, who proved that they took no part in the riot. The judge having summed up the case, the jury acquitted all the prisoners.

The Stockport Poisoning Case.—Robert Sandys was placed at the bar to receive sentence for the murder of his child, of which offence he was convicted at the last assizes, as noticed in this Paper at the time, when the circumstances under which the crime was committed were also given. Judgment, however, it will be remembered, was respited, by order of Mr. Justice Erskine, on a point of law raised by the prisoner's counsel, as to the formality of the indictment, it not stating that deceased died of the arsenic administered by the prisoner, but of a mortal sickness produced by the arsenic. The point was reserved for the consideration of the judges, who have decided that the indictment was in due form. The motive attributed to the prisoner for the commission of the offence was to obtain the fees allowed by a burial-club on the death of his children, three of them dying suddenly on their becoming entitled to the money. The prisoner being asked if he had anything to say why sentence of death should not be passed upon him, stated that he was innocent of the charge; and handed in two papers, one of which was a petition to the judge, setting forth the improbabilities of his being guilty of such a crime for so trifling a sum as 3*l.* 8*s.*, and the discrepancies in the evidence, particularly in that of the medical men; and the other was signed by a number of persons giving him a good character for humanity. His Lordship having put on the black cap, after adverting to the point of law which had been reserved for the consideration of the fifteen judges, said they had held the proceedings to be regular, and it now only remained for him to pass on the prisoner the sentence of the law. His Lordship then sentenced him to death in the usual form. It is stated that his Lordship ordered the prisoner's petition to be forwarded to Mr. Justice Erskine, who tried him, but fixed his execution for next Saturday.

Lucas v. *The Birmingham and Gloucester Railway Company.*—This was an action brought against the defendants as carriers between Bristol and Birmingham, to recover the sum of 7*l.* 5*s.*, the value of 21 lbs. of essential oil of lemons, leakage from a flask of that article, which the defendants carried from Gloucester to Birmingham, and which was damaged on its transmit. According to the evidence of plaintiff's witnesses, the flask in which the oil was contained, and which was of copper, had safely borne the voyage from Messina, packed in a stout wooden box; and after being imported at the Bristol custom-house, was carefully repacked in the same case, which was stuffed with straw, and then transmitted to Gloucester by waggon, where it was delivered at the company's station in good condition. It was addressed to the plaintiff at Birmingham, and "with care" marked on the package. Upon its arrival at Birmingham it was discovered that the package was leaking, and when delivered at the plaintiff's warehouse, the copper flask was much indented, and 21 lbs. of its contents were deficient. According to the witnesses for defendants, the injury was occasioned by the improper packing of the case, which it was sworn contained little or no straw, and nothing, therefore, to prevent the thin copper vessel from jarring and shaking against the sides of the box in the passage from Gloucester to Birmingham. It was shown that great care had been taken to place the box in the most secure part of the van in which it travelled; and it was urged that as the box was entirely uninjured, and free from indentation, while the flask was much battered and bruised, it was impossible that the loss could have been occasioned by any negligence on the part of the defendants. The flask was produced in court for the inspection of the jury, who found a verdict for the plaintiff for the amount claimed.

MARK LANE, FRIDAY, APRIL 15.—Since Monday the supply of English Wheat has been trifling, and the sales effected were at Monday's currency. The trade for free foreign is so exceedingly inactive, that scarcely any transactions have taken place, and in order to dispose of a quantity, a decline from Monday's quotations would be taken. There has been some inquiry for bonded Wheat, but at lower prices than demanded.—Barley, Peas, and Beans remain as on Monday.—Irish Oats are lower, but English are unaltered in value.—In consequence of an increased demand, Red Clover Seed has advanced 5*s.* from the lowest price.

GAZETTE OF THE WEEK.

INSOLVENTS.—S. J. Aldrich, Manchester-buildings, Holloway, chemist and druggist—T. Nutt, Eastcheap, London, plumber and glazier—W. H. Wells, Goldsworthy-place, Rotherhithe, bricklayer.

BANKRUPTCIES SUPERSEDED.—J. Lewis, Sedgley, Staffordshire, coal-master—W. M. Short, Martin's-lane, broker.

BANKRUPTS.—E. A. Dickinson, Pall-mall, money-scrivener—J. Dawson and W. Dawson, Tonbridge, Kent, builders—W. Payne, Hand-court, Holborn, victualler—H. Till, Moulsham, Essex, draper—R. Stringer, Great Yarmouth, wine-merchant—H. Edlin, Brighton, tavern keeper—T. Smith and T. Taylor, Worcester, retailer of boots and shoes—J. Pickering, Loughborough, Leicestershire, wine-merchant—R. Nutt, Frome Selwood, Somersetshire, maltster—E. Minty, Warminster, Wiltshire, maltster—J. Chaloner, Chester, currier—R. and G. Dransfield, Lees, Lancashire, cotton-spinners—J. Buckton, Darlington, Durham, grocer—W. Halliday, Liverpool, innkeeper—D. Cook, Liverpool, rope maker—J. Nutter and W. Eaiston, Cambridge, brewers—W. Morrison, Globe-street, Wapping, cooper—W. Burrell, Chingford, Essex, farmer—T. Thompson and J. Thompson, Newcastle upon Tyne, builders—J. Wallworth and T. Wallworth, Manchester, corn dealers—W. Hooper, Reading, Berkshire, tobacco manufacturer—M. Willis, Egham, Surrey, stage-coach-proprietor—C. Crock, George yard, Long-acre, livery-stable keeper—T. Kearsley, Tyldesley, Lancashire, cotton spinner—J. Hooley, Nottingham, miller—J. Smith, Nottingham, cabinet-maker—M. Redfern, W. Redfern, and J. Redfern, Ecclesfield, Yorkshire, file manufacturers—J. Abbott, Blackburn, Lancashire, cotton-manufacturer—J. Henshaw, Witton, Cheshire, ironmonger—G. Stokes, Bristol, innkeeper—W. Stewart, Ludgate-hill, muslin manufacturer—C. Long, Palace row, New road, glass-merchant—R. Duffell, Bow-common, tar distiller—G. Booth, Princes-street, Lambeth, lime-burner—G. Stephenson, Beverley, grocer—G. J. Green, Birmingham, glass-manufacturer—J. Bird, Coventry, fringe-manufacturer—C. Goodman, Northampton, cutler—C. O Reilly, Newport, Monmouthshire, timber merchant—J. Porter, Nantwich, Cheshire, tailor—W. Howarth, Swaffham, wine-merchant—T. Bull, Minories, London, grocer.

SCOTCH SEQUESTRATIONS.—A. M'Phedran, Greenock, cooper—A. Brown, Glasgow, iron founder—R. Duncan and Co., Greenock, ship-builders—J Campbell, Lettoch, Ross-shire, shipowner—J. Miller and D. Webster, Glasgow, machine makers.

BIRTHS.—On the 11th inst., in Curzon street, Lady Ernest Bruce, of a son—On the 4th inst., at the Rectory, Caversham, Oxon, the lady of E. Vines, Esq., of a daughter—On the 5th inst., at Homerton, the lady of B. Horsburgh, Esq., surgeon, of a son—On the 6th inst., at Brighton, the lady of Capt. T. Hilton, of her Majesty's 19th infantry, of a daughter—On the 8th inst., at Cheltenham, the lady of W. Chamier, Esq., of a son—On the 9th inst., at Whetstone, the lady of O. D Osborne, Esq., of a son—On the 9th inst., in New Millman-street, Mrs. R. Garland, of a daughter—On the 9th inst., in Cumberland terrace, Regent's park, the lady of J. Minet, Esq., of a daughter.

MARRIED.—On the 14th Feb., at Agra, T. K Loyd, Esq., Bengal Civil Service, to Annie Hirst, eldest daughter of the late Capt. J. Haig, of the Crescent, Bedford—On the 9th inst., at St. Giles-in-the-fields, G. Frere, Esq., jun., to Margaret Anne Corrie, third daughter of E. Corrie, Esq.—On the 11th inst., at St. Mary's Church, Cheltenham, the Rev. J. A Blackett, vicar of Heddon on-the-Wall, Northumberland, to Anne Jane, only daughter of the late Lieut.-Col. A. Hamilton—On the 11th inst., Mr. J. Davis, of Cheltenham, to Amelia, youngest daughter of the late Mr. J. S Friedeberg—On the 12th inst., at St. Mary's Church, Bryanston-square, F. D. W. Winn, Esq., Indian Navy, to Lucy, youngest daughter of the late J. Winckworth, Esq.

DIED.—On the 4th inst., at his residence, 12, Mount row, Lambeth, — Ellar, the most celebrated harlequin of his day, aged 62—On the 9th inst., — Conolly, the celebrated jockey—On the 28th ult., at Florence, Lord William Montague, younger son of the Duke of Manchester—Killed, in the pass of Khoord Cabul, Major H W. Bellew, Assistant Quarter Master General, Bengal Army, fourth and late second surviving son of the late R. Bellew, Esq., of Ballendiness, Castle Martyr, county of Cork—On the 6th inst., at Aberavon, Glamorganshire, Jane, widow of the late Rev. W. Rees, curate of Aberavon, and incumbent of Michaelstone—On the 10th inst., Miss Clarke, eldest daughter of C. E. Clarke, Esq., of Lower Grosvenor-place.

HOGG ON THE PICOTEE, &c.
Sixth Edition, with several coloured Illustrations, 12mo, price 6*s.*, cloth lettered,

HOGG'S TREATISE on the CULTURE of the CARNATION, PINK, AURICULA, POLYANTHUS, RANUNCULUS, TULIP, HYACINTH, ROSE, and other flowers; with a Dissertation on Soils and Manures; Catalogues of the most esteemed varieties of each Flower, &c.
Whittaker and Co, Ave Maria-lane.

LIEBIG'S AGRICULTURAL CHEMISTRY—SECOND EDITION.
In small 8vo., with numerous additions, including a NEW CHAPTER ON SOILS, price 9*s.* 6*d.*

CHEMISTRY in its Application to AGRICULTURE and PHYSIOLOGY. By JUSTUS LIEBIG, M.D., Professor of Chemistry in the University of Giessen. Edited from the Manuscript of the Author by LYON PLAYFAIR, Ph. D. "In the present Work Dr. Liebig has pointed out the path to be pursued, and has amply vindicated the claim of Science to be considered the best guide, by correcting the erroneous views hitherto prevailing, of the sources whence plants derive their nourishment, by developing the true causes of fertility in soils, and finally by establishing on a firm basis the true doctrine of Manures."—*Quarterly Review*, March 1842.—Printed for Taylor and Walton, 28, Upper Gower Street.

AMUSEMENTS OF COUNTRY LIFE.
In 8vo, illustrated with nearly 600 beautifully-executed Engravings on Wood, 50*s.* cloth lettered,

AN ENCYCLOPÆDIA OF RURAL SPORTS.
By D. P. BLAINE, Esq.

"A perfect library for all lovers of country sports, for all country gentlemen, and for all persons who delight in the manly and healthy recreations which are afforded to the inhabitants of no country in such perfection as to the inhabitants of the British Isles."—*Times.*
London: Longman, Brown, Green, and Longmans.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25*s.* each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3*s.* 6*d.* each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2*l.* 2*s.*

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25*s.* each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S BOTANICAL HISTORY OF ROSES, with Coloured Plates, price 21*s.*

5.

DR. LINDLEY'S ACCOUNT OF THE BOTANY OF SWAN RIVER, with Coloured Plates, price 10*s.* 6*d.*

6.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS. Illustrated by Drawings on Stone, from the Sketches of Francis Bauer, Esq., F.L.S., &c. Complete in Four Parts, beautifully Coloured, price 30*s.* each.

7.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21*s.* cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators; and on this account the present work should be in the hands of all gardeners and cultivators of plants; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16*s.*

SWEET'S BOTANICAL CULTIVATOR; or, Hothouse and Greenhouse Manual: giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By GEORGE BLISS, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit trees; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose: also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6*s.*

11.

THE FLORIST'S CULTIVATOR; or, Plain Directions for the Management of Florists' Flowers, Shrubs, &c.: select Lists of the most choice Flowers: to which is added the Monthly Operation usual for the Flower-garden, Shrubbery, and Greenhouse. By THOMAS WILLATS. Price 7*s* 6*d.* coloured and bound in cloth.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 16, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 17—1842. SATURDAY, APRIL 23. PRICE 6*d*.

GEOLOGY.—PROFESSOR WEBSTER, F. G. S., will commence his LECTURES on Monday, May 2, at 12 o'clock. The Course will consist of Thirty Lectures, and be divided into Three Parts:—1. The description of such minerals as enter essentially into the composition of rocks. 2. Geology properly so called. 3. The application of the above subjects to the useful arts. The subsequent Lectures will be delivered on Mondays, Wednesdays, and Fridays, at 12. Fee 3*l*.

The Course is open to gentlemen who do not attend any other Class in the College.

R. G. LATHAM, A.M., Dean of the Faculty of Arts.
CHAS. C. ATKINSON, Secretary to the Council.
University College, London, 13th April, 1842.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS.

The Committee beg leave most respectfully to acquaint the Subscribers whose subscriptions are unpaid, that by the Rules of the Institution, no person can Vote at the ensuing Election on the 2d of JUNE next, unless the Subscription be paid before that day; and that the Rules, &c., with a full and corrected list of the Subscribers, state of the Funds, &c., may be obtained on application to the Secretary, to whom all Post-office orders are requested to be sent, payable at the General Post-office, St. Martin's-le-Grand; and that, as the Secretary is exerting himself to save as much as possible the expense of collection, the Committee trust that Subscribers will kindly assist, by transmitting their subscription at their earliest convenience.

J. J. BOWLER, Hon. Sec.

THOMAS CRIPPS, FLORIST, TUNBRIDGE-WELLS, respectfully informs his Friends that Plants of the New White Fuchsia "VENUS VICTRIX" will be ready the first week in May, at 21*s*. each, with the usual discount to the Trade, if three or more Plants are taken at once. For particulars see Floricultural Cabinet for March, or Gardeners' Gazette or *Chronicle* of 5th inst. Orders for this will be received by Mr. George Charlwood, 14, Tavistock-row, Covent-garden; Messrs. Cormack and Co. New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood & Son, Maresfield Nursery; or addressed as above.

NEW AND SUPERB VERBENAS.

B. W. KNIGHT, FLORIST, &c., Tivoli, near St. Leonard's, Sussex, begs respectfully to inform the Public, that he intends sending out, the third week in May, the following Eleven New VERBENAS, which he can with confidence recommend as new and distinct Varieties; price, per set, 2*l*. 10*s*.; or by the single Plant, as under:—Davisoniana, rich shaded crimson; Majestica, very large, pink and white; Conspicua, light purple, with a white eye; Formosissima, rich shaded rose; Bride, fine pure white, very sweet-scented; Prince of Wales, fine rich scarlet, Tweediana habit—at 7*s*. 6*d*. per Plant. Leonora, fine lilac, sweet-scented; Brownleeana, fine large purple; Westongii, fine rich scarlet—at 5*s*. 6*d*. per plant. Ovid, fine purple; Chalmerii—at 3*s*. 6*d*. per plant.

NEW FUCHSIAS, CALCEOLARIAS, AND SPANISH CHRYSANTHEMUMS.

WILLIAM MAY, in tendering his grateful acknowledgements to his numerous Floricultural Friends for their former favours, is encouraged to announce to them that his descriptive List of SIX NEW HYBRID FUCHSIAS, of distinct character, and of very improved merit to anything yet before the public,—also his six new and superb CALCEOLARIAS, which he will warrant distinct and equal (if not superior) to any yet offered, the whole being perfect in shape, of superb size, and of exquisite colours—and also his fifty new and superior CHRYSANTHEMUMS, from the South of Spain,—is now ready, and will be forwarded, on post-paid application to his Nursery, Leeming Lane, near Bedale, Yorkshire. N.B.—Strong Plants will be ready to send out early in May.

NEW AND SUPERB FUCHSIAS.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias now ready to be sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s*. per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

CARNATIONS and PICOTEES.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL can supply the above Flowers at the following prices. Their collection is the most extensive and select in the kingdom, and for strength and healthiness are unrivalled. They beg to state that none but first-rate show flowers will be sent out.

12	pairs of fine Show Flowers,		by name	£1 10*s*. 0*d*.
25	do.	do.	do.	3 0 0
12	do.	extra fine	do.	2 10 0

Amongst which will be included a pair of that splendid Red Picotee ANACREON.—Great Yarmouth Nursery.

CARNATIONS AND PICOTEES.

TO GENTLEMEN, FLORISTS, and OTHERS.—R. ORSON, Florist, Florists' Agent, and Auctioneer, having made arrangements with one of the most celebrated Amateurs in the Neighbourhood of London for his Surplus Stock of CARNATIONS and PICOTEES, purposes Selling them by Auction at the Auction Mart, Bartholomew-lane, on WEDNESDAY next, 27th inst. The Plants are strong and healthy, including many new and very choice varieties, and well deserving the attention of admirers of these favourite Flowers.

May be viewed on the morning of Sale, and Catalogues had at the Auction Mart, *Gardeners' Chronicle* Office, the Crown and Anchor Tavern, Strand, and of the Auctioneer, 12, Hall Place, Kennington Lane, Surrey.—April 22, 1842.

AURICULAS, GERANIUMS, CARNATIONS, PICOTEES, and YELLOW PICOTEES.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment, Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine selection of the above Flowers, which he can offer at very moderate prices:—

	£.	s.	d.
Auriculas.			
25 Superfine Sorts, with their names, one plant of each	3	13	6
Geraniums.			
25 Superfine Sorts, with their names, one plant of each .	3	10	0
Carnations.			
12 Superfine Sorts, with their names, one pair of each .	1	15	0
Picotees.			
25 Superfine Sorts, with their names, one pair of each .	2	10	0
Yellow Picotees.			
12 Superfine Sorts, with their names, one pair of each .	2	2	0

A Catalogue of Geraniums can be had on application.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, DAHLIAS, FUCHSIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers is now ready for delivery, including Fuchsia, Conspicua arborea, raised by S. R. Prouse, Esq.; it is of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out an expanded bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Plants in May at 10*s*. 6*d*. Also two new and distinct varieties of the Verbena, from Texas—Ne Plus Ultra, a clear bright pink, with a rose-coloured spot surrounding the tube, which is white; a pleasing variety; colours very much resemble those of Phlox Drummondii: Elegans, a pale pink, with a delicate rose-coloured spot surrounding the tube; plants in May, the two, at 10*s*. 6*d*. Likewise Dahlia, Lady Ann Murray, a beautiful mottled white tipped with bright rosy purple, a well-formed flower, with a fine centre, one of the most constant Dahlias grown, and desirable to the most limited grower, 3 feet, 10*s*. 6*d*.

Hans-street, Sloane-street, Chelsea.

BELMONT NURSERY, STOKE, NEAR DEVONPORT.

JESSE ADAMS having purchased the entire stock of SEEDLING GERANIUMS raised by Charles Thurtell, Esq., begs to acquaint the Public that he has now a large stock of well rooted, healthy Plants ready for delivery. They comprise the following 24 varieties, viz.: Thurtell's—Britannia, Radical, Wonder of the West, Ne Plus Ultra, Surprise, Warrior, Masterpiece, Ultra Flora, Queen, Queen Consort, Queen Dowager, Ann, Armada, Lady Minto, Eclipse, Admiral, Collingwood, Nelson, Revenge, Bride, Elegans, Exquisite, Sir Graham Moore, Reform. J. A. has also the entire stock of another seedling Geranium raised by a different party, consisting of three plants only, two of which are for sale at 45*s*. each. This beautiful variety possesses all the qualities of a first-rate flower, and which J. A. proposes to name the "Beauty of Belmont;" never before advertised.

With respect to Mr. Thurtell's flowers, all of which are allowedly excellent, it is difficult to make a selection; but the four first named on the list are admitted to be splendid first-rate flowers; and of these, "Wonder of the West" is by competent judges said to be the finest Geranium ever blown. These four varieties will be sent out at two guineas each.

A very large variety of other healthy, well-rooted plants, on moderate terms.—Stoke, near Devonport, April 12th, 1842.

PLYMOUTH NURSERY.

ALEXANDER PONTEY begs to call the attention of the Public to his Stock of Hothouse, Greenhouse, and other PLANTS, especially to his new FUCHSIA TRICOLOR, a beautiful delicate blush white, with sepals tipped with green; a free grower and bloomer; plants of which are now being sent out at 10*s*. 6*d*. each. Also the following PELARGONIUMS:—

Lyne's Countess of Mount Edgcumbe .	21*s*.	0*d*.	each.
— Diadem, a large white . .	21	0	—
— Peri of the West	10	6	—

The sorts named under at 60*s*. per dozen:—Amethyst, Beauty, Bridesmaid, Corona, King John, Wildfire, Inez de Castro, Nymph, Lady Douro, Prince Albert, Vulcan, Comte de Paris, Sultan, Pince's Zenobia, Jupiter, Matilda, Lifeguardsman, Apex, Wonder, Pride of the Hill. Other good sorts at from 9*s*., 12*s*., to 18*s* per dozen.—Plymouth Nursery, April 4th, 1842.

MYATT'S BRITISH QUEEN STRAWBERRY.

J. and W. MYATT beg to return their sincere thanks for the very liberal patronage they have received from the Nobility and Gentry, and to inform those who have not yet favoured them with their orders, that the approaching season is most desirable for planting; they can supply plants of the British Queen and Eliza Strawberry, the former at 5*l*., the latter at 1*l*. per 100.

The unpropitious state of the weather for late autumn-planting induces them to inform those who have been purchasers, that they will be happy to reinstate any that have not succeeded, by direct application to the parties who have supplied them, such application to be limited to April. Plants carefully packed and forwarded to any part of England.

Manor Farm, Deptford, March 31, 1842.

GUANO MANURE.

W. SKIRVING, SEEDSMAN, QUEEN-SQUARE, LIVERPOOL, begs to announce to Landed Proprietors, and to Farmers and Gardeners, that the price of the genuine Guano has just been fixed by the importers as follows:—viz., 16*l*. per Ton for quantities under five Tons, and 15*l*. per Ton for any larger quantity.

W. S., from his experience with the Guano on various crops last year, and from the appearance of the crops of Grass at present where it was last year applied, can with confidence recommend it as a very good and, at the above price, a cheap Manure, for any garden or field crop. With this conviction, he has accepted an Agency for the Sale of the genuine Guano, and shall be happy to receive orders, which shall be promptly executed, direct from the Importer's Stores.

Terms of payment, ready money; a remittance or reference required.—Liverpool, 9th April, 1842.

NEW and SPLENDID DAHLIAS. — P. STEIN, having prepared a Catalogue of the New and Seedling Dahlias, amounting to nearly One Hundred, and added two or three dozen of the best of the established favourites, respectfully announces that it is now ready, and may be had on application. Miss Chester, the best White Dahlia in the world, having broken well, early orders will be executed with strong Plants the first week in May, price 10*s*. 6*d*. The King of Prussia, which took two first prizes and one third prize, against all England, will, although a Seedling of the same year, having broken well, be let out the first year, and be ready at the same time, at 10*s*. 6*d*.—Grove Nursery, Highgate.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,, 24 ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 48 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s*. 6*d*.

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s*. 6*d*.

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10*s*. 6*d*.

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class: and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant*.

FLORICULTURAL SEEDS.—The Undersigned begs leave to recommend the following choice Flower Seeds to the notice of his customers and the Public in general. The Asters, Stocks, Zinnias, &c. have gained Prizes in all parts of the Kingdom.

JAMES CARTER, Seedsman and Florist,
238, High Holborn, London.

GIOVANNI MARSANO has just received from his country, Genoa, 120 Italian, all Orange Trees. Nurserymen may be supplied at 5s. to 15s. each Tree. And likewise 500 Catalonian Jasmine Plants, at 60s. per 100 Plants. These beautiful Orange Trees may be seen, and orders will be thankfully received, at G. Marsano's, Italian Oil Merchant, No. 2, Beauchamp-street, Brook's Market, Leather-lane, Holborn, London.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.—WILLIAM WOOD & SON beg leave to draw the attention of Amateurs to a splendid New Seedling PETUNIA, Fielder's Magna rosea, price 3s. 6d. each; also two magnificent Seedling GERANIUMS, raised by C. W. Fox, Esq., of Truro, viz., the Princess Royal, 21s. each, and the Duke of Cornwall, 21s. each, ready for delivery early in May. For description see *Gardeners' Chronicle* of 9th April.

Plants of the above may be had at the Nursery, Maresfield; in London of Messrs. Warner and Warner, 28, Cornhill; Mr. J. Carter, 238, High Holborn; and at Tunbridge Wells of Mr. T. Cripps, Nursery. Usual discount to the Trade if three or more of the above are taken at once.

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leafed Kidney, but capable of being produced in perfection for table from November till June, is now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle*.

"We can only repeat, that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle*, Apr. 2.

⁂ Orders for sample baskets, enclosing 1s., will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

TO BE DISPOSED OF—A NURSERY, SEED, and FLORIST BUSINESS, situated at Henley-on-Thames, Oxon. For further Particulars apply to Messrs. W. & J. Noble, Seedsmen, 152, Fleet-street, London; or to the Proprietors on the Premises.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to PUBLIC AUCTION, at the Mart, Bartholomew Lane, on THURSDAY, April 28th, and following day, at 12 o'clock, a very choice Collection of DAHLIAS, a rich Assortment of CARNATIONS and PICOTEES, the newest Varieties of FUCHSIAS and VERBENAS; also a Variety of Plants in bloom. May be viewed the morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

NEW PLANTS, &c.

MESSRS. VEITCH & SON beg to offer to the Public the undernamed Plants.

Gloxinia Speciosa, var. Macrophylla Variegata. An imported plant from the Brazils, and of which a figure, &c. may be seen in the Botanical Magazine for April 1842. 2*l*. 12*s*. 6*d*. per plant.

*Begonia Coccinea, beautiful vermilion colour, from Brazil. 21*s*. per plant.

*Cycnoches Maculata, variety, 84*s*.

Stigmaphyllon Aristatum, 42*s*.

*Primula Denticulata (Hardy), from the Himalayas, fine, 10*s*. 6*d*.

Triptilion Spinosum (Hardy Perennial), from Chili, 42*s*.

NEW GERANIUMS.

Fair Maid of Devon (Veitch's). This flower was exhibited at the June exhibition at Chiswick in 1841, and pronounced by the principal Nurserymen and Amateurs to be one of the most splendid Geraniums ever seen. It is of large size and first-rate form, the upper petals beautiful bright crimson, with a distinct white margin round; the under petals light pink, with white centre. Extra fine, 63*s*. per plant.

Rose of Oxton (Swete's), raised by J. B. Swete, Esq., Oxton-house. The colour a fine bright rose, with clear white centre; fine form, abundant bloomer, and compact habit. A really good variety. 21*s*. per plant.

* Mulatta (Swete's). A beautiful clouded flower, upper petals being almost black, and the under petals deep crimson. An abundant bloomer, and a striking fancy variety, but the form indifferent. 15*s*. per plant.

⁂ A notice of the three plants marked * may be seen by reference to Proceedings of the London Horticultural Society's meeting of the 15th of March last, when a medal was awarded them; see *Gardeners' Chronicle*, No. 12, p. 190.

A part of the extra premium on unsound lives may remain as a debt on the policy. Application to be made to

EDWARD POWER, Sec., 25, Pall-mall.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES—Green, 1*s*. per lb.; White, 1*s*. 2*d*. per lb.; or from 2*s*. 6*d*. to 24*s*. per dozen. Cucumber Tubes, all lengths, from 6*d*. to 4*s*. each. Grape Shades, from 2*s*. 6*d*. each. Irish Globes, from 1*s*. 6*d*. each; ditto for Fountains, with solid bottom and hole, 2*s*. 6*d*. per lb.—APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars, where every description of Table Glass China is on show. Days for viewing the Works—Tuesday, Wednesday, and Thursday.

OILS, COLOURS, VARNISHES, &c.—Best Ground White Lead, 30s. per cwt.; 2nd, 28s.; 3rd, 24s. Linseed Oil, 3s. per Gallon; Turps, 4s. 9d.; Dry or Ground Brunswick Green, from 4½d. to 1s. per lb.; Invisible Green, for Rough Work, 30s. per cwt.; Stone colour, 34s.; Celestial Blue, 6d. per lb.; Quick-drying Carriage Varnish, 14s. per gallon; French Polish and Spirit Varnishes, 20s.; Naphtha do., 11s. 6d.; Burning Naphtha without smell, 6s. 6d. per gallon; Best Stockholm Tar, 21s. per barrel; Coal do., 10s. 6d. do.

Every description of Colour Brushes, &c., of the best quality, at the lowest prices for cash, at Nixey's, 22, Moor-street, Soho.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

⁂ NUTT ON BEES (5th edition) now published.

£180. A-YEAR FOR £1,300.

NINE SUBSTANTIAL HOUSES, now in complete Repair, situate in ROBERT STREET, COMMERCIAL ROAD, PIMLICO; held for a term of 82 Years, at a low Ground Rent. Half the purchase-money may remain at 5*l*. per cent. for two years.—For further particulars apply to Mr. Harrison, Solicitor, 34, Bloomsbury-square.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER, a respectable Man who has a thorough knowledge of his business. Can have an unexceptionable character from the Gentleman he is now leaving, with whom he has lived seven years. Address, post-paid, to A. B., Mr. Ivery's, Nurseryman, Peckham, Surrey.

WANTS a SITUATION as GARDENER, a respectable and clever Man, aged 35, of practical experience, understands the Business in every department, and has been many years in the profession. Can have a good character from the gentleman he has just left. Direct to W. M. M., Osborn's Nursery, Fulham, Middlesex.

WANTS a Situation as GARDENER, a steady, active Young Man, who possesses a thorough practical knowledge of his business in all its different branches, and can be highly recommended for honesty, sobriety, and attention. Direct to J.E., at the Office of this Paper.

WANTS a SITUATION as GARDENER, a steady, respectable Man, aged 26, who understands his business in its respective branches. His character will bear the strictest investigation by reference to his late employer. Direct to A. M., Mr. Westbrook's, 2, John's-place, Walworth Common, Surrey.

WANTS a SITUATION as GARDENER, a Married Man, without Family; is now employed by Mr. Mills. He understands Forcing Pines, Grapes, Peaches, and all its various branches, in which he has had great experience.—Direct to Mr. George Mills, Gunnersbury Park, Acton, Middlesex.

WANTS a SITUATION, a Married Man, aged 41, who thoroughly understands forcing in all departments kitchen-garden, flower-garden, greenhouse, and meadow-land. Lived last in a highly respectable family upwards of 10 years, from whom he can have the highest character. Direct to G. C., Mr. Ebden's, 22, Union Road, Clapham Retreat, Surrey.

WANTS a SITUATION as GARDENER a single man, aged 34, a native of Scotland. He is a thorough practical gardener, and would not object to make himself useful to his employer. Has fulfilled the situation of gardener and steward, with management of woods and plantations. Satisfactory references from the nobleman he has just left. Address A. B., 15, Hemming's-row, Charing-cross, London.

WANTS a Situation as UNDER-GARDENER, a Young Man, 22 years of age, who has a general knowledge of his business; is willing to engage with any Nobleman or Gentleman's Gardener, or to an Establishment where Forcing of considerable extent is carried on. No objection for a suitable exchange, or to go to any country (Scotland excepted). Any one requiring the services of the above will meet with due attention by addressing W.S., Post Office, Sydenham, Kent.

PUNCH'S GUIDE to the LIONS of LONDON will be PUBLISHED on the 30th INSTANT, Price 3*d*., profusely illustrated with Engravings from Designs by Leech, Meadows, Crowquill, Henning, &c. &c.: being No. 42 of PUNCH; OR, THE LONDON CHARIVARI.

On the same day, Part 10, price 1*s*. 4*d*.—Vol. I. may still be had, price 7*s*. 6*d*., and all back Numbers are always kept on sale.

Office, 13, Wellington-street, Strand.

Just published, post 8vo, cloth, price 7*s*. 6*d*.

THE CYCLOPÆDIA OF THREE THOUSAND PRACTICAL RECEIPTS in all the USEFUL and DOMESTIC ARTS; being a complete Book of Reference for the Manufacturer, Tradesman, and Amateur.

By A PRACTICAL CHYMIST.

London: John Churchill, Prince's-street, Soho.

In one Volume, elegantly bound, gilt edges;

PAXTON'S POCKET BOTANICAL DICTIONARY.—The immense quantity of useful and interesting information condensed in this little volume, relating to the history, culture, and uses of all known Plants, should render it the indispensable pocket companion of every one fond of Plants, or in any way connected with gardening, as a pursuit or amusement. As a book of reference it will be found useful to the profession, and interesting to all classes. It is, in fact, a miniature Botanical Encyclopædia.

London: J. Andrews, 167, New Bond-street; and Orr and Co., Paternoster-row.

COTTON'S NEW TRACTS FOR COTTAGERS.

In 12mo, price 6*d*., or 5*s*. per doz. (with Woodcuts),

The VILLAGE SCHOOL, Part II. (To Parents of Children who go to School.) By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxford; Chaplain to the Bishop of New Zealand; and Author of "My Bee Book."

Rivingtons, St. Paul's Church-yard and Waterloo-place.

Also just published, by the same Author,

1. The VILLAGE. 2. The VILLAGE SCHOOL. Part I. (To Children.) Price 6*d*. each.

Third Edition, corrected, 1 vol. 8vo, with nearly 200 Woodcuts, price 18*s*. cloth lettered,

ELEMENTS OF PRACTICAL AGRICULTURE, comprehending the Cultivation of Plants, the Husbandry of Domestic Animals, and the Economy of the Farm. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh.

"No work on practical agriculture has appeared in our time which will bear a comparison with this excellent work. It will become the manual of practical agriculture for the British empire."—*Edinburgh Phil. Journal.*

London: Longman, Brown, Green, and Longmans.

ENCYCLOPÆDIA BRITANNICA.

SEVENTH EDITION.

This great National Work is now completed, in 21 volumes 4to, illustrated by 506 Engravings on Steel, and many thousands on Wood. The GENERAL INDEX contains upwards of 68,000 references, forming the most comprehensive Index of General Literature and Science in the English Language.

In Paper, Printing, and Embellishment, as well as in the literary value of its contents, the work is accommodated to the improved taste and advanced information of the times; and, whether for the purpose of systematic study or occasional reference, the proprietors are satisfied that the Seventh Edition of the Encyclopædia Britannica will be found to be the most valuable addition which can be made to a modern library.

Adam and Charles Black, Edinburgh.
Simpkin, Marshall, and Co.; Whittaker and Co.; and Hamilton, Adams and Co., London.

A NEW HAND-BOOK OF GARDENING.

Just published, in 240 pages, price 1*s*. 6*d*. cloth, gilt edges,

FLORA'S CABINET; comprising full details for the Cultivation of 15 of the principal Flowers that decorate our Gardens, namely, Anemone, Auricula, Bell, Cactus, Camellia, Carnation, Dahlia, Geranium, Heartsease, Hyacinth, Pink, Polyanthus, Ranunculus, Rose, and Tulip; with ample Directions for every Month in the Year; short Abstracts of the Linnæan and Jussieuian Systems, Flora's Clock, the Primitive Elements of Plants, and other useful matter.

Orlando Hodgson, 111, Fleet-street.—Free by post, 2s.

HORTICULTURAL SOCIETY OF LONDON.

SYLLABUS of a COURSE OF SIX LECTURES on the CHEMICAL PRINCIPLES WHICH REGULATE THE GROWTH OF PLANTS AND PROCESSES OF VEGETATION. By EDWARD SOLLY, Esq. Jun., F.L.S., M.R.I., &c., Experimental Chemist to the Horticultural Society. To commence on Friday, April 29, at 3 P. M., and to be continued on succeeding Fridays at the same hour.

SUBJECTS OF THE COURSE.—Introduction. Objects of chemistry and mode in which chemical inquiries are conducted. Chemical affinity. Composition and decomposition. Simple and compound substances. Constitution of organic matter. The proximate principles of Plants. The nature of the soil, the food of plants, and the different stages of vegetable life, germination, formation of leaves, woody matter, flowers, and fruit; death and decay of plants. Results of the decay of organic matter. Action of manures, their nature, use, and abuse. Theories and new views.

Tickets for these Lectures are issued gratis exclusively to Fellows of the Society, upon application to the Secretary. No Fellow can have more than two tickets, which will admit two friends. As the meeting room will not accommodate more than 200 persons, the Council have directed the issue of tickets to be stopped as soon as that number shall have been distributed. It is therefore hoped that no one will apply for tickets except with the full intention of making use of them.

21, Regent-street, April 18, 1812.

The Gardeners' Chronicle.

SATURDAY, APRIL 23, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Floricultural	2 P. M.
	Zoological	8½ P. M.
Wednesday	Medico-Botanical	8 P. M.
	Microscopical	8 P. M.

A FORTNIGHT since we mentioned that a short course of Lectures upon the application of Chemistry to the arts of cultivation was about to be given by Mr. Edward Solly, jun. In an advertisement in our Paper of to-day, it will be seen that the plan of the course is settled, and that the Lectures are given gratis to the Fellows of the Horticultural Society and their friends *exclusively*. The great attention which this gentleman has paid to the subject leads us to hope for a very interesting series of illustrations.

THE shrivelling or "shanking" of Grapes is a subject upon which few gardeners agree—almost every one possessing an opinion of his own as to its probable cause.

A few years since, a gardener applied to us for advice, stating that most of his bunches had "shanked" off; a disease which, till that season, had never affected his Vines. We have never entertained a doubt that this malady is caused by a cold soil, in which the roots are compelled to seek their food; we therefore advised him to examine his border, as it was very possible that during the severe winter of 1837-38, the frost might have destroyed the surface roots, upon which his Vines were most dependent for support; and that the remaining roots, having penetrated into a deep and cold subsoil, could no longer keep up that reciprocal action with the stem upon which the welfare of the plant depended, nor supply the leaves and bunches with nutriment suitable for bringing the latter to maturity. We told him that he might be sure that this was the reason why the stalks of his Grapes withered, and the berries, instead of obtaining their natural colour and flavour, became shrivelled, and remained acid. In this opinion, however, he did not coincide; contending that such could not possibly be the case, his Vine-border having always hitherto been considered dry, with a sandy subsoil. He therefore proposed to remove the surface soil a spit deep, and to replace it with cow-dung 12 months old. Our observation upon this proposition was, that it might modify the evil by encouraging roots near the surface; but that the old deep roots would still be the principal feeding organs; and that the only effectual course for him to take was to drain his border effectually.

Not, however, finding it convenient to adopt this plan, and feeling convinced that his Vine-border could not be better drained, our correspondent "followed his head," and, as might have been expected, the shanking continued season after season, until at last he resolved to follow the advice we at first gave him. Upon examining his border, he found ample reason to regret that he had felt so well satisfied with its condition. Instead of being light, warm, and dry, it was found to consist of a rich, adhesive compost, as cold and retentive of moisture as it well could be; in fact, to use the gardener's own expression, "it cut out as solid as a piece of cheese." No roots were found near the surface of the border, excepting a few which had shot out from the necks of the Vines into some moss with which they had been surrounded. The main supply of food had, therefore, been derived entirely from the deeper roots, some of which were found 4½ feet beneath the surface.

The cause of shanking in this case was, we conceive, precisely what we originally stated, and what, we repeat, it is in nearly all, if not all, cases. Those roots upon which the Vines were dependent for support were completely beyond the reach of the sun's influence; and the temperature of the soil in which they grew, instead of corresponding nearly with the atmosphere of the house, must have been many degrees lower. Under such circumstances, it was impossible for the fibres of the roots, chilled and torpid in the midst of their dreary soil, to obtain food at anything like the rate demanded by leaves and ripening fruit stimulated at once by a dry atmosphere, and the light and warmth of the solar rays. Of the small quantity of food which was transmitted to the stem, the nature was so bad as to be little suited for its destined purpose. There are some excellent remarks upon this subject by a writer in another column.

Our correspondent has now taken our advice in earnest; the soil is lightened, the drainage is made effectual, and the Vines are replanted. In due time we shall communicate the result.

WE understand that the place of gardener in the Royal Forcing Garden at Kew, vacant by the death of the late Mr. Aldridge, is not filled up; and that it is the intention of the Lord Steward, with whom the appointment lies, to select the very best man he can find, without reference to other considerations. This is one of the few prizes in the lottery of gardeners.

WE have great pleasure in announcing the formation of a Horticultural and Botanical Society at the town of Wellington in the New Zealand Company's harbour of Port Nicholson. From a letter now before us, we learn that the objects of the Society are the extension of horticultural pursuits, the improvement and adaptation to the climate of the colony of the vegetables, fruits, and flowers already introduced from other countries, and the examination of the vegetation and other natural resources of New Zealand. Another most important part of the plan is "to encourage among the labouring classes industrious habits and a right employment of their leisure hours, by offering annual premiums for the best-cultivated cottage gardens." Within ten days of the intention to form the society being made known, the number of subscribers was 103; we have reason to believe that the New Zealand Company have determined upon lending the institution their support, both by pecuniary assistance and otherwise; and we doubt not that the next ships will convey to the colonists substantial proofs of the goodwill of other public bodies in this country.

We regard this event as most satisfactory evidence of the flourishing condition of those parts of New Zealand which have been judiciously colonised, and as a proof that we were right when, many months ago, we strongly advised such of our readers as had friends intending to emigrate to select those islands as the spot where the settler has "the most to hope, and the least to fear." (See p. 99*, 1841.) Straws, we know, when thrown into the air, denote the direction of the storm; while stones fall to the earth, and tell us nothing. So, in the affairs of nations, slight occurrences may be often taken as the best indication of the true course of events, while graver matters give no sign. It is not when they are struggling with difficulties and in precarious tenure of property that people think of forming scientific societies, but when they are tranquil and prosperous—when they are satisfied with their condition, and see no dangers in the horizon.

We are led to make these remarks for the sake of guarding our readers against believing the many newspaper misrepresentations upon the subject of New Zealand. One paragraph asserts that a township is under water, another that people are re-selling their lots and abandoning the colony; a third, that the whole country is cut up into deep gullies, inclosing valleys which cannot possibly have any communication with each other; and another, that the colony, in addition to its natural barrenness, is already wasted by storms, and will soon be devastated by the barbarous natives. It is important to observe that these assertions are all *anonymous*, and no one is answerable for their truth. That they are either wholly false, or that they apply to certain parts of the colony which no well-advised emigrant would have settled at, is notorious to all who have any real acquaintance with New Zealand.

As an example of the misrepresentations that we allude to, take the statement some weeks since copied into all the papers, that the New Zealand Company obtains 60*l*. profit upon every 80*l*. they receive for land; while the fact is, that by the Company's charter and agreement with the late Secretary for the Colonies, Lord John Russell, they cannot get more than one acre of land for every 1*l*. expended on emigration, that they re-sell it at the same price, and that their profit is in the shape of a small discount allowed them by Government.

Anonymous writers assert that all the land in New Zealand is worthless, uncultivable, or inaccessible. Against this we have the testimony of travellers who have visited the country;—of the Hon. Mr. Petre, whose word is above suspicion; of Mr. Bidwill, whom we know personally to be a good judge, and, what is no doubt important, a disinterested witness; and of the responsible officers of Her Majesty's Government. It was only the other night that the Noble Lord, the Secretary for the Colonies, stated in the House of Commons that there exists an enormous quantity of fertile land in New Zealand. Upon turning to Mr. Bidwill's pamphlet, we find him speaking of the country everywhere towards the south of the northern island as admirably adapted for cultivation, with plains suited for rearing herds of cattle; and describing Port Nicholson, the principal settlement of the New Zealand Company, as surrounded by abundance of excellent land, "sufficient for the employment of any amount of population for 20 years to come,"—as "an excellent harbour, with a navigable river, the Hutt, and a great extent of very rich land, an admirable site for a town," and so on. Let it always be remembered that these are the statements of a *known writer*, and that they are confirmed by other *known* authorities; while the statements opposed to them are anonymous.

It is no doubt true that some parts of New Zealand are sterile, rugged, and uncultivable. Such, in particular, is all the northern part, especially about the Bay of Islands, the great missionary station. In speaking of this place, Mr. Bidwill describes it thus:—

"At the Bay of Islands it is almost impossible to find a place suitable for the site even of a moderate village; and the country is so rough and broken, that there are no means of going from one part of the Bay to another by land; and the shores also of the Gulf of Hamaki are more mountainous even than those of the Bay. The country around is hilly, and may be said to be nothing but a succession of gullies, rendering the use of wheel-carriages of any kind (except perhaps ox-carts) almost impracticable. The soil is clay, produced by the decomposition of the lavas and other volcanic rocks of which the whole of this part of New Zealand is formed. It is bad—that is to say, as bad as any soil can be in a climate so moist and temperate as that of New Zealand. I have, it is true, notwithstanding, seen very good vegetables grown in the gardens; but as these gardens are always in the small level spots in the vicinity of the gullies, their produce is no criterion of the general goodness of the soil, as such spots receive the whole richness of the surrounding hills, and for agricultural purposes would be totally unavailable from their small size. There are but two spots about the Bay where towns could be built—one, the site of the village of Kororarika, notorious at present for containing, I should think, a greater number of rogues than any other spot of equal size in the universe; and the other, on the opposite side of the Bay, near the missionary establishment, Paihia (Pyhea)." And elsewhere he expressly declares, that it is only *in the country south of the Thames* that the fine land and fine climate are to be found.

On the *north* of the Thames is the Bay of Islands, and the new seat of Government, Auckland; to the *south* is the land of the New Zealand Company.

Auckland has, we understand, an extremely wet climate, and is exposed to violent gales: to that settlement, then, emigrants should not go, any more than to the Bay of Islands; for, being in the vicinity of the seat of Government, is a poor compensation for all the disadvantages arising from dangerous storms, and rugged ground unfit for agricultural purposes. But those who attempt to show that the bad quality of the Bay of Islands and Auckland is characteristic of New Zealand generally, are to be regarded in precisely the same light as men who should apply to Great Britain the description of the Shetland Islands.

NEW METHOD OF HEATING AMATEURS' STOVES.

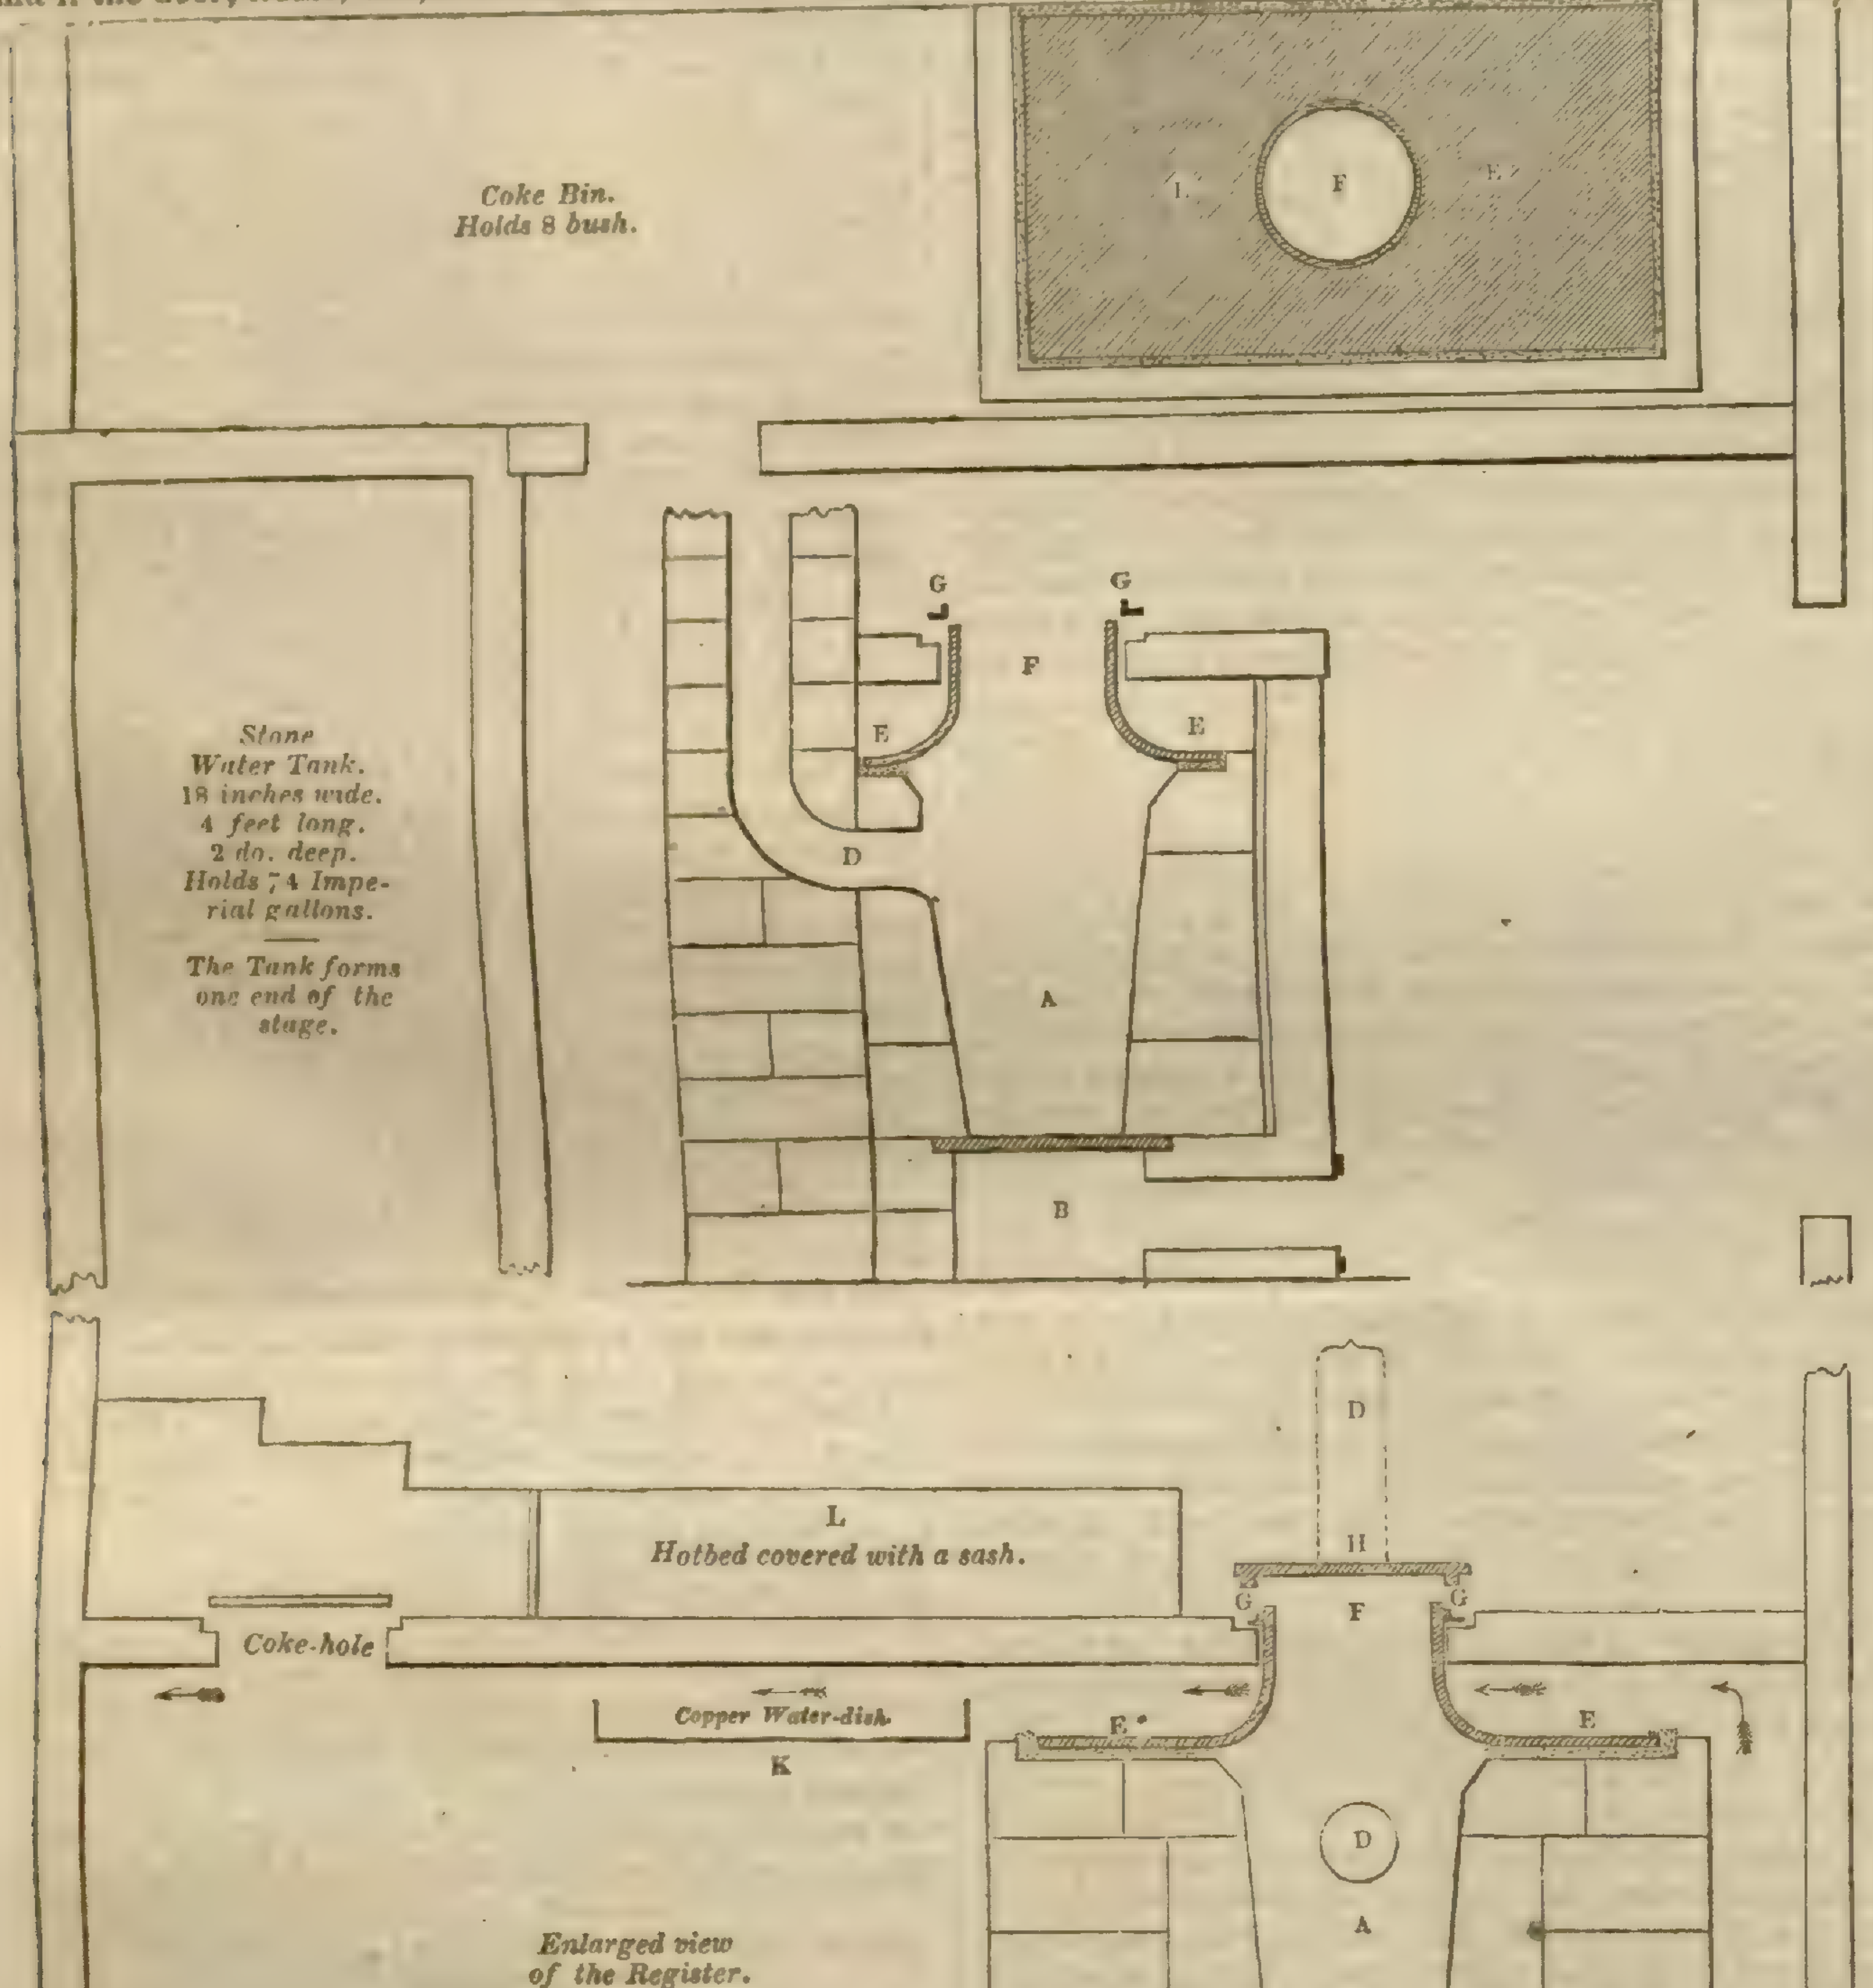
EARLY in the spring of last year I had a stove built in a small hothouse, which up to the present time has answered perfectly well, and I think will be useful, as it requires no attention except once in the morning and the last thing at night: being built under the stages, it is quite out of sight.

The accompanying sketches represent the plan and construction of it. The stove, which consists of the body, A, for containing the fuel, B the ash-pit, C the register, and D the flue, three inches diameter, and built within the thickness of the wall; E, E, a cast-iron plate covering the whole opening of the body of the stove (it lies in a rebate and is bedded in sand, with sufficient space to allow for expansion), and having a collar or neck, F, standing upon it, which neck passes through the stone shelf, constituting the top of the stages all round the house: to this neck is attached a copper ring, G, G, which is securely fitted to it; a flanch one inch broad projects from this, and together may be called a frill; the flanch covers the space (¼ of an inch) between the sides of the aperture in the stone shelf and the outside of the cast-iron neck. It will be seen by reference to the plan, that a rebate is sunk round the aperture in the stone shelf, and that the frill lies in it, and is covered with sand to prevent the escape of the rarefied air at this particular spot. Now, when the stove is heated, the neck will expand nearly the eighth of an inch; and as it does so, the flanch will slide over the rebate and thereby prevent the stone shelf from splitting, which would inevitably take place but for this precautionary arrangement. The neck, which is seven inches diameter inside, forms the stokehole: the opening is covered by a cast-iron cover, H, having a projecting fillet an inch deep; this fillet lies upon the sand in the rebate, and effectually prevents the escape of smoke or gaseous vapour from the burning fuel. When the cover is removed for the purpose of lighting the fire, the smoke does not rise through the neck, being prevented by the draught into the flue, which is placed twelve inches below the opening of the neck. The register consists of a cast-iron frame, having a clear passage of five inches by three; this is secured to the stone front by a couple of quarter-inch bolts, and made perfectly air-tight; if the frame is let into the front, it will, in all probability, split it, as it did mine on the first trial of the stove—the register frame is rebated, the door slides in it, and is secured by a couple of thumb-screws tapped into the frame. The door has a hole drilled through it two inches in diameter, which is covered by a brass plate accurately ground to it, and turning over the aperture in the same manner as the escutcheon plate of a keyhole. In the brass plate also there is a small hole five-eighths of an inch in diameter. When the fire is lighted, the brass cover is opened to blow up the fire, and then closed, the smaller hole in the cover being sufficient for the purpose of letting in just as much air as is necessary for the slow combustion of the fuel. The size of the smaller aperture is experimentally correct, and if the door, frame, &c., are well made and air-tight, this being an important point, the combustion of the fuel (one and a quarter pecks of maltsters' coke, not gas coke, which is very inferior in duration) will go on for twelve or fifteen hours without any attention.

---

* At this place "Cruciferous" was misprinted for "Coniferous" trees.

The whole of the stove is built within an air-chamber, which forms one side of the stage, and is composed of a single slab of stone, with which the whole of the top is also covered. The brickwork of the stove may be built solid as high as the top of the grate, but all above that should be half an inch from the front, leaving the three sides of the stove exposed to the action of the air. The object I had in view, in constructing the stove within an air-chamber, was to obtain means of warming the air before it entered the house. This is effected by admitting the cold air into the hot-air flues through an opening in the partition wall, which may be fitted with a slide door to regulate its admission, and the clear opening should be about four inches by eight. The cold air passes through the air-flue, I, round the three sides of the stove and over the top of the cast-iron cover, E, E, upon which are placed a number of bricks, standing half an inch apart; passing onwards, it enters the house at the extremity of the stage or chamber. When a moist atmosphere is required, fill the copper dish, K, with water, which is so placed that the air cannot enter the house without first passing over its surface; the dish is filled by pouring water into a lip which protrudes through the stone front about a couple of inches.



My hothouse is six feet square, with a greenhouse adjoining (but separated from it by a glass screen), six feet by ten feet—being of recent construction and having at present but a small stock of plants, none of which require a high temperature. I have consequently had no opportunity of trying the full power of the stove, which has never been heated but during the night. The fire is lighted at nine P.M., and it usually burns from twelve to fifteen hours, or according to the quantity of coke employed; the temperature of the hothouse has never been below 40° at nine P.M., and 50° at nine A.M., during the severest nights of the past winter. This is certainly not a hothouse temperature; but if the fire had been kept in during the day as well as night, there can be no doubt that it would be fully equal to any temperature that might be desired. The door which separates the one house from the other is kept ajar one inch and a half; the warm air passing through it is sufficient to keep the greenhouse from 32° to 55° during the night. The flue of my stove passes immediately into that of the chimney; but if it was laid horizontally and continued round another side of a much larger house, it would be fully capable of heating it; in fact, there is no limit to the heat which the stove is capable of producing, as I could, by admitting more air, produce so intense a heat as to melt brass. I have a small frame, L, placed upon the top of the air-chamber; it consists of wrought-iron, and is six inches deep; round the upper edge there is a copper gutter, five-eighths of an inch wide and half an inch deep; the upper or glass part drops into the gutter, and the two ends of the glass frame are furnished with slides to let in air; the temperature (no sunshine) at nine o'clock P.M. was 62°—nine o'clock A.M., 75°—and at two o'clock P.M., 72°. With fire in the day, it would, of course, have been much higher. It is an excellent substitute for a hotbed; I borrowed the idea of the frame from the portable greenhouse, and placing it upon the air-chamber was an after-thought of my own. A great deal has been published in the *Chronicle* respecting the imitation of climates in hothouses, &c.; it appears to me that the desideratum is, how can we introduce successive volumes of pure air from the atmosphere, raised to the required temperature, and more or less charged with moisture? I think only in one way, and that by means of air-chambers. The usual mode of warming the nearly still atmosphere of a house is something similar to the impure air of crowded rooms. At page 365 (1841), there is a plan of heating air in chambers; it might be useful to your readers to refer them to it.—*H. L., Hull.*

FLORAL ANALOGIES.

(Continued from p. 253.)

11. Alpinia racemosa. Clustered Alpinia.—A plant which is most successfully grown when treated as an aquatic. Analogous to a tee-totaller, who thrives best on water.

12. Zingiber officinale. Culinary Ginger.—As in physical economy ginger is used to excite a brisker action of the vessels in torpid and phlegmatic constitutions, so in moral economy is anger useful to excite a more prompt action in sluggish minds. What anger is in the moral, ginger is in the physical world. As the Zingiber officinale is used in the eastern parts of the world in cataplasms and fomentations, but is never taken as an internal medicine; so anger, although useful as an external motive, never interiorly benefits its applier.

13. Callitriche aquatica. Water Starwort.—A small aquatic plant, of a Proteus kind, which, from its liability to variation in appearance, has often deceived botanists, and analogises with the Chameleon, much more so than does the Lupinus mutabilis.

14. Nyctanthes Arbor-tristis. Sad Night Flower.—Nyctanthes is derived from *νυξ*, night, and *ανθος*, flower, as its blossoms expand and are fragrant only in the night. It analogises with a sorrowful spirit, whose virtues are only brought out in adversity, and whose beauties are only known in distress.

15. Veronica officinalis. Culinary Speedwell.—This simple little flower is the emblem of domesticity, as it is never found above a mile from a human habitation.

16. Utricularia vulgaris. Vulgar-hooded Milfoil.—It is impossible to preserve the flowers of this plant as dried specimens in any hortus siccus whatever. The beautiful colours of the genus, purple, pink, violet, or yellow, when dried, all change to a dead uniform black, thus analogising with the virtues of the human being, which are but too frequently forgotten after his life; or reversedly representing those false hues with which some are clothed in life, in appearance only beautiful, but whose real want of colour or virtue is displayed by the justice of the tomb.

17. Rosmarinus officinalis. Vulgar Rosemary.—This plant establishes itself upon any old wall, and will resist the severest cold of a northern winter. It thus grows luxuriously, and analogises to the character very generally, whether justly or not, given to the Scotch, that they will live well upon anything, and are satisfied with frugality. With the ancients Rosemary was esteemed the plant of Memory and Repentance; thus the poet says—"There's Rosemary, that's for remembrance."

18. Gladiolus Cunonia. Scarlet-flowered Corn Flag.—The generic name of this plant is from gladius, a sword. It is the floral emblem of the soldier; its leaves are sword-shaped, and its banner-like blooms are red.

19. Crypsis aculeata. Prickly Crypsis.—The name of this genus is derived from *κρυπτω*, I conceal. The heads of the flowers of this plant being at one time concealed in the sheath of its leaves, it analogises negatively with the deceitful person, and affirmatively with unknown genius or secluded virtue.

20. Petrophila diversifolia. Various-leaved Petrophila.—The generic name of this plant is derived from *πετρος*, a rock, and *φιλεω*, I love, on account of its mountainous growth. It analogises with the mountaineer, and particularly so with the Switzer, as all Alpine plants more or less do. The Petrophila, however, from its name, is pre-eminently the vegetable symbol of the mountineer. It is the St. Peter of the floral church of God. "On this rock I build my church."—*Goodwyn Barmby.*

(To be continued.)

AMATEUR'S GARDEN.—No. XVII.

Many of the cuttings which were put in a few weeks ago for the decoration of the flower-garden during summer and autumn will now be ready to pot off. After potting, they should be put into a frame, kept close, and shaded during bright sunshine, until they have formed roots in the fresh soil for their support. Those who have little room to spare in the greenhouse or frames, may place such plants as Pentstemon gentianoides and its varieties in a sheltered situation out of doors, as it is nearly hardy; strong plants of Fuchsias and Verbenas may also be set out, but it will be prudent to protect them with stakes and mats at night. The amateur, with very limited convenience, who is anxious to have a fine display of half-hardy plants in his garden during summer, will thus be enabled to do a great deal in the way of propagation at this season of the year, with prudence and good management.

If Balsams are sown now and properly treated, they will be very beautiful objects either for the greenhouse or sitting-room after the earlier flowering Pelargoniums are gone by. The amateur should first try and procure seed which has been saved from good kinds. The best way to raise them is by sowing the seeds in pans amongst light soil, and placing them in a hotbed; a Cucumber or Melon frame will answer the purpose very well. In these circumstances they will soon vegetate, and when about two inches high they ought to be potted off into sixty-sized pots. Any light rich soil will suit them; equal quantities of light turfy loam, rotten dung, and leaf-mould answer the purpose extremely well. They require to be regularly shifted into larger pots when the roots reach the bottom and outsides of the soil, and ought to be potted a little deeper at every shifting; it will also be necessary to shade them for a short time from bright sunshine if the roots have been in any way injured by the operation. The hotbed is the best place to grow them in a young state, but they must be kept near the glass; if not, they will get drawn and unsightly, and lose their chief beauty—that of being clothed from top to bottom with branches and flowers. As soon as they are well established, they ought to have plenty of light and air; after which the hotbed is not at all necessary. It is much the best way to train them to be short-jointed and hardy, as they are neater and better adapted to the purposes of the amateur. The lights may be frequently taken off during the day in mild weather, and put on early in the afternoon. The main points to be attended to are, regular shifting, abundance of water or liquid manure, and plenty of light and air. Balsams may be grown well by those who have not the convenience of a hotbed. The seeds should be sown in the same way as I have already described, and placed in a warm window or even out of doors during the day, with the seed-pot covered with a small piece of glass. When they come up and are potted off, they should be kept in the inside of the window, and slightly shaded if the sun shines. When strong, they can be placed out of doors in a sheltered situation, or kept in the room, as may be most desirable, and they will flower beautifully for several months in autumn.

Plants in the greenhouse will now require a liberal supply of water; liquid manure will be found useful to the free-growing kinds, such as Pelargoniums and Calceolarias; many of which will probably require another shift to enable them to flower well. Those who are fond of Melon-growing may sow the seeds now, and they will find some directions for their proper management by and by.—*R. F.*

HOME CORRESPONDENCE.

Effects of Sulphur on Ants.—With reference to a communication in No. 14, would Mr. Bowers have the goodness to state further particulars respecting the application of sulphur to ant-hills? Was any fire put to the sulphur, or was it flour of sulphur with which the holes were filled? and if so, had it the effect of destroying the ants, or did it only drive them to remove to another place by rendering it unpleasant to them? The grass on the lawn appears to have been benefited by the sulphur; has Mr. Bowers had any experience of its effect where the ant-hills have been at the roots of shrubs or flowers? So far as the destruction of the ants is concerned, I should think powdered quicklime put into the holes would answer every purpose. It might afterwards be rendered more powerful by having water poured on it.—*W. D.*—Mr. Bowers has obligingly favoured us with the following statement of his mode of application:—"There was no fire used; it was simply flour of sulphur from a grocer's shop (8*d.* per lb.). My short experience in the matter will not warrant my stating positively that the sulphur killed the ants; on that head I am not yet quite satisfied, for those that I could discover dead in the soil bore little proportion to the great numbers I saw in the hills when applying the sulphur; yet when I consider the early and frequent visits of small birds to these spots, with the fact of the ants disappearing in a few days, and not reappearing since (eleven months) on several acres of short grass, or any adjacent place that I could observe, there is some reason for supposing the sulphur destroyed them. I have not yet used it at the roots of shrubs or trees for that purpose, but have to Pelargoniums, Bouvardias, and other plants in pots, by mixing a little sulphur with the surface soil; should they descend to the bottom of the pot, by placing sulphur in a pan and the pot in it, a dislodgement is soon effected. I have also applied it to the roots of Cucumbers and Melons in pits and frames. In one particular instance last summer, I found a strong nest under my only two plants of a choice and valuable Melon, busy casting up the soil over the shoots and leaves, and destroying the young fruit as the flowers expanded; to remove them, I mixed about a quarter of a pound of sulphur with the soil; in a short time they became less active, and in three days they were no longer to be seen, and did not reappear in any other pit or frame; the Melon plants soon became healthy and vigorous. This last winter I had observed a few ants in a new Cucumber-pit, and about three weeks ago they appeared in strong force from a nest close to the plants; about two ounces of sulphur mixed up with the soil in the nest had the effect of clearing the pit, and though there are other Cucumber and Melon pits adjoining, yet they have not reappeared in any of them—leaving me to think my remedy is simple, effective, and cheap. —*H. Bowers.*

Shrivelling of the Incipient Bunches in an Early Vinery.—In answer to an "Angler" of April 9th, I beg to state that in writing of the shrivelling up of incipient bunches, I alluded as much to the general management of the Vine as was sufficient to elucidate my subject, and that if there had been anything peculiar in any respect, it would not have been omitted. An "Angler" complains that the exact weight necessary to secure an attempted runaway bunch was not given; but although ever anxious to oblige my brethren, I do not see the propriety of providing myself with a weighing-machine to gratify the mere curiosity of those "many practical gardeners who have thoroughly examined the subject, and condemned it as theoretical and not practical." To me this matters not, so long as I find the practice very beneficial in those unfavourable circumstances to which I referred. I hope from the knowledge now diffusing respecting the importance of shallow, well-drained borders, and the possessing a sufficiency of heating surface in the house, that a system which aims at enticing a greater degree of nourishment to enter the stems of the fruit will not be much wanted in vineries; and I referred to it, not for the purpose of excusing the want of good management, but as a method that might be tried as an auxiliary to it. (In line 29th of my previous communication, the expression "anxious not to part," should be "anxious not to hurt a quantity of rootlets," &c.) An "Angler" will be pleased to observe, that I did not ascribe the effect produced to gravitation, and the result of experiments this winter and spring lead me to conclude that gravitation has nothing to do with the success of the system.—*Robert Fish.*

Cause of Shrivelling in Grapes.—I was pleased to find in your last week's *Chronicle* that an experienced angler had observed Mr. Fish's letter, and shown the absurdity of his gravitating system; as such communications frequently tend to a gardener's annoyance if they meet the eye of an employer who insists upon the adoption of such a practice! I have often been afraid that the incipient branches of many of my Vines would go blind, but I have generally succeeded in saving them without trying any charm; certainly the bunches have never been so compact nor so well shaped; but the question is, what is the cause, and how is it to be avoided? My experience leads me to believe that it proceeds from a cold border, and imperfectly ripened wood, and that a current of air (although it ought to be avoided) has nothing to do with it. In proof of my assertion, I have a house with a double set of Vines, one planted on the outside, and the other within; they are trained on alternate rafters, and equally exposed when air is given. Those which are planted within the house have set their berries as well as I could wish, but a few of the uppermost branches of those Vines which have their roots outside have proved abortive. Not being satisfied with the latter, I last year cut them down after they had commenced growing, and when there was no danger of bleeding; consequently they had not sufficient length of season to mature their wood, particularly towards the top, the shoots being left nearly twenty feet long. If "Angler" will be able to inform his brother gardeners the real cause of shrivelling when the fruit is ripening, he will do them a great service. I can attribute it to only two causes, and I have facts to go by. The first and most common belief is, that the footstalk of the berries gets scalded; the other, that when the roots of the Vines are too deep in the earth, or in a wet soil, the fruit absorbs more of the sap than it can convert into saccharine matter, and at the period when the fruit is ripening that sap naturally leaves the berries as if they were leaves, and retires into the wood or evaporates. In proof of what I have advanced, I have a black Frontignan Vine, which annually produces forty or fifty bunches, and they always look plump and well until they begin to ripen, they then commence shrivelling. This Vine was planted in an impenetrable mass of blue and yellow clay, which I entirely removed, and found that not a single root had strayed in an oblique or horizontal direction from the stem, but that all had gone perpendicularly down, and entered the sand (the natural soil), which at three feet deep is full of springs in the driest season. In the same house I have two Muscat Vines: the one produces large berries, but generally imperfectly ripened (I do not force them); the fruit of the other is never so large, but always of a fine amber colour, and seldom shanks: the former had only one naked root, which had entered the clay at an angle of forty-five degrees, and struck down into the sand; the latter had two similar roots, one of which descended in the same manner, the other found its way horizontally towards the pillars on which the flue is built. I traced it for thirty feet without finding a lateral root (unless, as is very probable, they had died), until it reached a part of the flue imbedded under the soil; it then divided into a number of minute fibres. As I sometimes have fires, I believe the warmth of the flue is the only agent in producing better ripened fruit on that Vine; and if the roots could be kept near the top of the border where the sun's influence could dry and warm the soil, the Grapes would not be so apt to shrivel as they advance to maturity. You may perhaps be surprised when I inform you that I removed this clay border to the depth of two feet during some hot days in June, when the Vines were in full blossom; and although I neither applied wet mats nor any other protection during the operation, not a leaf flagged. After filling in fresh soil, I sunk the stems a foot deeper than they were before, and I have had the gratification to find that they have produced new fibres nearer home.—*No Conjuror.*

Brachycome iberidifolia.—I have heard many complaints of the shyness of this pretty annual to seed, and in yesterday's *Chronicle* perceived a query from a correspondent on the same subject, which induces me to give my own experience concerning it. The first season, 1840, I raised it from Swan River seeds; and the plants turned out in the borders were too late to perfect seeds out of doors, therefore I saved the small quantity I obtained from a few plants kept in the greenhouse. The following spring, 1841, I took care to have my plants ready to be put out in a prepared bed by the end of May; and having been raised in a gentle heat, they flowered during the summer, although by no means in a sheltered situation; and in the month of September or the early part of October seed was perfected. I need not remind any experienced cultivators that care is requisite in gathering each head of seed as it becomes matured.—*J. Brewster, Gardener to Mrs. Wray, Cheltenham.*

Clianthus puniceus.—"G. B." a Limerick correspondent, has furnished us with the following statement:—"As a proof of the mildness of our climate, there is now in Mr. Bevan's garden, near this town, a fine plant of the Clianthus puniceus in full bloom. It is trained against a wall, is 9 feet high, extends 16 feet, and is now covered with some hundred clusters of pendent scarlet blossoms."

Disease in Ash Trees.—Can you, or any of your readers, give me any information respecting a peculiar disease affecting healthy young Ash-trees of about 35 years' growth, and from 26 to 30 inches in girth? They grow freely in good, sound, dry ground—have a clean, smooth, healthy-looking bark, which, however, becomes dead in peculiar diamond-shaped patches both on the stem and branches of about one-sixth of the trees in my plantation, the rest being apparently perfectly free from it. This decayed portion, which appears at first like a contusion or bruise, being slightly and evenly depressed, extends through the alburnum and slightly into the wood. The same tree has many such patches, in some instances threatening the entire destruction of the plant, but in others where the disease is less extensive, the restorative powers of nature seem to be overcoming the evil. These patches vary in size, measuring about 16in. by 5in. on the stems, and of course much smaller on the branches.—*Fraxinus, Anglesea.*—[We should be glad to hear the opinion of our foresting friends on this subject. We suspect the disease arises from pruning severely when the sap was in motion.]

Necessity of Oxygen to Seed.—I took a quantity of mould, the result of decomposed leaves, which had been laid in a pond in a clay-field for 3 or 4 years, and placed in it a variety of seeds and plants; and I found that not a seed would vegetate, nor a plant grow in it. At the same time, I took some mould, the result of leaves decomposed by exposure to the air on the surface of the earth for three or four years, and it produced a most luxuriant growth in all the plants placed in it. Then what was the cause of these different effects? I conclude, the absence of oxygen in the pond mould, and the presence of oxygen in the land mould. I will also state another experiment. I took some vegetable mould from a bog-hole on a common, which had been exposed on the surface of the earth for twelve months, and filled two garden-pots with it, in each of which I transplanted a plant of Wheat, and to one of the pots I gave a supply of a solution of soda, to the other none. Both plants grew, but the one with the soda produced four times as much straw and grain as the one growing in the bog-earth alone.—*Jos. Hayward, Lyme.*

Asparagus.—Although my garden affords Asparagus sufficiently succulent and tender, by the ordinary mode of cultivation, yet it is not of the size of your St. Sebastian vegetable; I have, therefore, adopted the principles of the Guipuscoan method in the following manner:—A small compartment can be made to receive the drainage of my stable-yard and piggery at pleasure, and in heavy rains can be completely flooded from the same source. This I have hollowed out by the removal of the garden soil (a stiffish loam) and supplied its place, in part, with drift-sand. I shall allow this new soil to receive the liquid manure and settlings of the above-mentioned drainage one year (perhaps stealing a superficial and transient crop of some summer vegetable), and then crop, next spring, with one-year-old Asparagus plants. Situated as my new beds are, it will be understood that I can renew the waterings and floodings at pleasure, and make them more or less potent in saline and alkaline materials, with very little trouble, and (what I presume from the nature and natural habitat of the plant is of great importance) give it its season of dryness as well as of abundant moisture. You shall hear (please the Dryads and Naiads) of the result of my plan in due time. As many gardens offer the same facilities for spontaneous watering and manurings of such beds as mine, I beg to suggest that coal-ashes (often not easily to be disposed of where there is no demand for brickmaking) may, when mixed up with ordinary garden-mould, answer the purpose as well as drift-sand.—*P. P.*

Potatoes.—Amongst the causes of failure in late plantings may be reckoned the effete and barren condition of the eyes of the "sets." I discovered this some years ago, on observing a labourer, planting in May, rubbing off the shoots because they were grown rather longer than he thought expedient to the welfare of the plants. The practice of rubbing off the buds to preserve the roots for the table, and the careless way of selecting plants that may have suffered repeated mutilations of this sort, are the frequent causes, I believe, of thin crops. It cannot be denied that the first and leading shoot of every eye affords (*cæteris paribus*) the strongest and most productive plant; and that when this is removed, although subsidiary ones will be produced, they are much weaker; and if these in their turn are rubbed off also, the "set" may be as useless as a fragment having neither rind nor eye at all. —*P. P.*

Broccoli.—You do a very grateful thing to us amateur gardeners by now and then treating a whole subject as you have done that of Asparagus. I am looking anxiously for the paper you, or some of your coadjutors, have kindly promised us on Broccoli. I am constantly in a puzzle amongst the various sorts now offered to us, and about the times of sowing and planting out, and am very desirous of settling in a good successional order. Some 20 or 30 years ago there was a neat, hardy, and early purple Broccoli which suited the climate of my garden, but I cannot now procure it amongst all the purples I try. The purple "prolific," or sprouting sort, suits me very well. If I sow the "Cape" early, it soon runs to seed; and if late, it produces a mere button. The most delicate early white, or Cauliflower sorts, are too tender for my situation, unless protected by a littering of straw, or, if good-luck would have it so, a thick coat of snow: and so, also, "Knight's Protecting," my garden being low and obnoxious to hard frost. The "Portsmouth" and

"Sulphur" are hardier, but they are coarse, and do not boil tender. There is a circumstance, also, in the cultivation of the tenderer white kinds which I cannot find cause for; it is the comparative smallness and insignificance of the heads produced in the spring, from plants of large stems and luxuriant growth in the preceding autumn.—*P. P.*

The Nuthatch.—In Bewick's description of the Nuthatch, he says, "it does not migrate, but in winter approaches nearer inhabited places, and is sometimes seen in orchards and gardens." Now I have never seen it in my garden in the winter, but for years a pair have built in one of the holes of my wall, about three yards distant from a nursery window. Some seasons back, before these birds arrived, a pair of tits had taken possession, and nearly completed their nest, but the old tenants soon ejected them and their materials. This season the same thing has occurred. The Nuthatches are now making the hole round, according to their practice, by filling up the angles with clay. The hole is about five feet from the ground; during the time of incubation, the hen does not readily leave the nest on my looking at her, but salutes me with an angry hissing sound. I cannot but wish them a happy connubial season, as they draw the subsistence of themselves and their young from the insects and larvæ that infest our trees.—*E. B.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

April 19.—Sir O. Mosley, Bart., in the Chair. Alex. Allan Francklyn, Esq., and Gen. Brotherton, were elected Fellows. From Messrs. Rollisson there was a fine specimen of Dendróbium macrophyllum, which, although not in such good condition as it had been a few days previously, was still very beautiful; with it were Combretum macrophyllum, a climbing plant with clusters of bright crimson flowers, which it produces freely, and Dombeya cannabina. A Knightian medal was awarded for the Dendróbium. Messrs. Lucombe and Pince exhibited a new white Azálea, called A. leucomegista, certainly a fine variety, possessing much the habit of a Rhododendron; the leaves are much broader than those of the old A. indica, the flowers larger, and produced in dense clusters. There was also an early bloom of Rosa devoniensis from the same nursery. A Knightian medal was awarded for the Azalea. Messrs. Veitch sent Manéttia bicolor, a new greenhouse climber from the S. of Brazil, with beautiful scarlet tubular flowers, tipped with yellow; and a species of Epidendrum. A Banksian medal was given for the Manéttia. From Messrs. Young were a handsome species of Gesnera; a seedling Azálea, with large light purple flowers; a very rare plant called Bládhia japonica, and Illícium religiosum—the foliage of this plant has some resemblance to that of the Orange, the flowers are gathered by the Japanese to perfume their temples, and the fruit is also used in many of their ceremonies. A certificate was awarded to Messrs. Young for this plant. Messrs. Chandler brought two plants of Caméllia nítida, with small flowers and striped and cupped petals; it was introduced from China by John Reeves, Esq., and is likely to prove a good variety, although it does not differ materially from some of the kinds now cultivated. A certificate was given for these. From Mr. Rivers was a splendid collection of forced Roses, chiefly Perpetuals, which are found to force admirably, and to retain their fragrance; the following is a list of those exhibited:—

Perpetuals.

Torrida, brilliant crimson.
Bernard, pink, beautiful form.
Grand, or Fabert's, very large, bright rose.
Lodoiska, also very large, blush.
Antinöus, deep purplish crim.
Ferox, very large, lilac rose.
Clementine Seringe, pale blush; this has the peculiar odour of the Cabbage Rose.
Triomphante, deep rose.
Requien, pale blush, very large.
Billiard, brilliant rose.
Rose du Roi, or Crimson, light crimson, large.
Comte de Paris.

Tea-scented.

Bougère, pale rose, very large.
Pactolus, bright straw colour.
Duchesse de Mecklenburg, straw colour, large.
Mansais, fawn colour and rose, very large.
Lyonnais, bright rose.

Moss.

Celina, brilliant crimson.

Bourbon.

Hebe's Cup, brilliant rose, very large, perfect shape.
Emile Courtier, rose, large and very double.
Desgaches, pink, very double, and finely shaped.
Bizarrine, light crimson.
Bouquet de Flore, bright rose.

Noisette.

Ne plus Ultra, creamy white, very fragrant.
Miss Glegg, white tinted with rose.

Hybrid China.

Madame Plantier, pure white, very double, and perfect-shaped.
Hippocrate, bright rose.
Kleber, brilliant crimson purp.
Beauté vive, bright rose, perfect-shaped.

A certificate was awarded to Mr. Rivers for this collection. Mr. Low exhibited a Conánthera, from Chili, with dull blue flowers Mr. Brown sent a collection of Heartsease, amongst which were some excellent varieties, and a stand of his seedling, called the Countess of Orkney. From Mr. Silverlock was a seedling Heartsease, called Prince Albert. From the garden of the Society there was a large collection of plants, containing Cyrtopódium punctatum, having yellow flowers spotted with brown, which, although it has been known for some time, has seldom been seen in blossom; but from want of light the colours of that exhibited were not so bright as they ought to have been: Broughtónia sanguínea, with a slender branch of beautiful crimson flowers; a new variety of Oncidium leucóchilum, the colours of which are darker and brighter, contrasting better with the delicate whiteness of the lip; Epidéndrum sellígerum, with violet-scented flowers; Pentlandia miniata, a pretty bulbous plant, with red wax-like flowers; and a dwarf variety of Chorozema várium, covered with a profusion of blossom.

LINNEAN SOCIETY.

April 19.—Edward Forster, Esq., in the chair. Mr. M. Pakenham Edgworth was elected a Fellow. The Secretary announced that the Society had received a bequest of 100*l.* from the late Archibald Menzies, Esq. Mr. J. O. Westwood exhibited a collection of insects from Central India, consisting of Sphingidæ, nocturnal Lepidoptera, and other insects, from the collection of Lieutenant-Colonel Hearsey. This collection was interesting both on account of its local character, and in comparison with the splendid collections that have been recently exhibited to the Society from Silhet and the Himalayah. There was a single specimen of Papilio Hector, no Lucanus, nor true Fulgóra. There was a new species of Paussus, and also of Diopsis. There were both sexes of the hymenopterous genus Trirogma, several very English-looking Harpalidæ, and various species of Arthyrei and Bolboceri. The continuation of Mr. Blackwall's paper on new species of British Arachnida was read; also a paper by Mr. J. O. Westwood, on a new species of Paussus, contained in the above collection, which he proposed to call, after the gentleman who had brought it from India, P. Hearseyii. Specimens of Primula scotica, gathered at Wick, near Caithness, were exhibited by Joseph Janson, Esq.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 13th.—The Duke of Richmond, K.G., in the chair. The Earl of Somers was elected a governor, and 36 gentlemen members.—The Rev. W. L. Rham, M.A., vicar of Winfield, laid before the council the second part of his paper "On the Agriculture of the Netherlands," the first part of which was printed in the first part of the second volume of the Society's Journal last year, and has already been translated into German, and inserted by Professor Sprengel in his Monthly Journal of Agriculture, published at Coslin, in Prussia. The author gave, in his former paper—1. An account of the geographical situation of the Netherlands, describing the climate as similar to that of Kent or Essex, and its temperature as warmer in summer, and colder in winter, than that of the central part of England; the quantity of rain which falls there not being so great as in this country, but the snow covering the ground for a much longer time; these circumstances causing a material difference in the time of ploughing the land and sowing the seed in spring. 2. A statement of the natural quality of the soil in the Netherlands, with an account of the various modes adopted for its amelioration and improvement, for the purposes of profitable cultivation; the author ascribing the improvements effected in the poor, sandy heath soils of that country to two important classes of operations, namely, first, to the change produced in the mechanical texture by a judicious stirring, pulverising, and admixture of the different earths composing them, thus adapting them to the growth and penetration of the roots of plants, and the drainage of water from the land; and, secondly, to their impregnation with liquid and compost manures, binding their loose texture by means of their humus or decayed organic matter into more consistent soils, and affording that nutriment to vegetation which the carbon held by those manures in solution is known to convey to plants. 3. A description of the nature and use of the various implements of tillage employed from time immemorial by the cultivators of the soil in that part of Europe; the author enumerating these, as the old Flemish plough (for light soils, without stones); the old Walloon plough (for the stiffer soils); the two-wheeled turnwrest plough (for clover leys or grass lands); the double-breasted plough without a coulter (for smoothing inter-furrows, straightening ridges, and throwing the earth sideways between rows of Turnips or Potatoes); one-horse harrows for loosened soil (for covering the seed and finishing the pulverisation of the soil); the flat wooden traineau, loaded with stones, and drawn by horses (for levelling the surface of light soils without compressing them, breaking the clods more effectually than the stone roller); the rodded hurdle (for the same purpose); the mollebart (or shovel, for levelling newly-trenched land); the Hainhault scythe (for cutting corn); the winnowing machines, scythes, hoes, and rakes, being similar to those used in England, thrashing-machines being of little use, from the small extent of the Flemish farms not requiring or justifying the attendant outlay of so much capital. In this second part, in continuation of his paper, the author proceeds to give most interesting details on the following subjects connected with Flemish husbandry:—1. On the system of rotation of crops adopted in the Netherlands, as the result of long experience of its value; with distinct accounts of their modes of cultivation in the case of Rye, Barley, Buckwheat, Turnips, Belgian large white Carrots, Beans, Potatoes, Flax, Colsa, Rape, and Hemp. 2. On the dairy management of Holland; the author entering into interesting information respecting the dairy pastures and cowhouses; the treatment and care of the cows; the construction and perfect cleanliness of the dairies; the mode of churning (by means of horse-power, the revolution of dog-wheels, or the application of human labour to a lever like that of the common pump-handle); the preparation of butter, and the mode of its preservation in barrels, with an account of the plan pursued for obtaining and purifying the salt employed by slow crystallisation from sea-water; and a detailed statement of the various cheeses made in Holland, either for home consumption or exportation. 3. A description of the cattle, sheep, horses, and waggons of that country. The author attributes the success of the peculiar system of rotation of their crops to the abundance of liquid and compost manure with which the Dutch impregnate their arable soils, and thus furnish them with so rich a permanent stock of nutritive matter as to obviate their exhaustion by a succession of crops, which, without such supply, would fail in their result; to their careful weeding, and to their deep-stirring of the soil. The author gives an account of the system pursued on a farm near Coutray, consisting of little more than 100 imperial acres, where the following rotation was strictly adhered to, and found to be very profitable. The farm was entirely arable, and divided into six portions: No. 1, half in Flax, and half in Colsa; No. 2, Wheat; No. 3, Rye and Turnips; No. 4, Oats (five-sixths of which with Clover-seed, one-sixth left for Potatoes and Carrots); No. 5, Clover and roots; No. 6, two-thirds Wheat, and one-third Beans. This rotation, the author observes, could not be continued long if the manure were not very abundant. Flax and Colas recurred only once in twelve years; Wheat nearly every third year; Rye, Turnips, and Oats, once in six years; Clover once in six years; Potatoes and Carrots only in very small quantities, the soil being a stiffish loam. Experience proved to the farmer, that every deviation of any consequence from this course diminished his profit. The land was abundantly manured, and all the crops were in the greatest perfection when the author visited the farm. This shows, in the author's opinion, that where manure can be had in abundance, the rule, which otherwise is advantageous, of not taking two white grain-crops in succession, may be deviated from without much danger of exhausting the land, especially in rich loams; that Wheat may always in such case be sown every third year, while Clover, Flax, and Colsa require longer intervals. The principal manure consisted of night-soil, and other rich manuring substances from the neighbouring town, which, with the sweepings of the streets and the ashes, formed a very considerable addition to the manure made on the farm. It will rather surprise the English farmer, observes the author, to be informed that on such a farm 30 milch cows and heifers were constantly kept, and that two paddocks, of a few acres' extent, for the cows to take exercise in, about two hours each day, were the only part of the farm not under the plough. The cows had oil-cake, beans, clover, and roots, with cut straw, the clover being nearly all consumed in a green state. The urine tank was most capacious, being 20 feet wide, 7 deep, and 50 long, divided by partitions. The cow-house was washed out twice a-day, there being usually a pump in the middle of it, with a stone cistern under it, in which bean-meal was constantly kept, mixed with the water which the cows drank, and this greatly increased the quantity of milk they yielded. The author bears testimony to the admirable cleanliness of every department connected with the cow-house, the dairy, and the buttery, and gives an account of the various arrangements for effecting this essential object. The rich soil, he observes, gives no doubt a good quality to the butter; but this is not the only cause of its superiority. The extraordinary cleanliness of every part of a dairy, and the constant and abundant use of water—the bright polish of the utensils, wherever there is any metal—and the whiteness of the wood of the pails and churns, show the unremitted attention of the dairy-woman. But the cleanliness is not confined to the place where the milk is kept. The stables, the cows, and even the litter, are kept so clean, that it is a pleasure to walk through them; and the family often make one end of the cow-house their usual sitting-room, having a fireplace at one end, and always, at least, one comfortable bed for a labourer or servant, who constantly sleeps in the cowhouse. The author describes the Dutch waggons as light in weight, with a very narrow track to accommodate them to the narrow roads on the tops of the dykes; and as a pole would be a great incumbrance in the act of turning round within a narrow space, a curious substitute has been adopted, namely, a very short crooked pole, which rises in front, and is moved by the driver with his foot, as he wishes to direct the course of the waggon to the one side or the other; a person unaccustomed to the use of this contrivance, never being able to drive a Dutch waggon, which requires great judgment to steer it, while a drunken driver would be discovered a long way off by the oscillations of his waggon, which frequently runs off the dyke, and is overturned into the ditch on one side or the other, the horses having no power to keep it straight when the crooked pole has not a steady foot to guide the front wheels. The Dutchmen always make their horses trot in the waggon when not heavily loaded, by which much time is saved in hay-making and harvest; and the horses being accustomed to it, naturally trot like carriage-horses when the load and roads permit.—E. Bullen, Esq., Secretary to the Royal Agricultural Improvement Society of Ireland, in a letter to the council on the subject of the annual country meeting of that society, to be held this year at Cork, expressed a hope that they should receive assistance from the persons assembled at Bristol. The following presents to the society were submitted to the council:—1. A collection of 217 soils and subsoils, with a catalogue explanatory of their nature and locality: presented by J. Morton, Esq., of Chester-hill.—2. A set of Cubic Measures, proposed for adoption in lieu of the ordinary cylindric standards, from their greater simplicity and uniformity in calculation. The suggested improvement being found on a principle of a quart being represented by a cube of 4 inches, a peck by a cube of 8 inches, as tests or standard measures of capacity, while their parts or multiples consist of even numbers of cubic inches without fractions; with a rule gauge of 8 inches, for estimating, by the measure of depth, the cubic contents of cylindric vessels: presented by T. N. Parker, Esq., of Sweeney Hall.—3. A self-adjusting quicksilver level, for engineering, surveying irrigation ground, &c. This level consists of quicksilver freely coming to a level in a curved or rectangular vessel; floats of ivory of equal height resting upon the two surfaces of the quicksilver, accommodating themselves in every position of the vessel to the same level as that of the mercury on the surface on which they rest. The box is so contrived by the nozzles in which the floats move up and down, and by means of leather enclosed within the other joints, as to retain the quicksilver securely within it, even if turned upside down. When the instrument is used, the horizontal line of level is taken by the naked eye, by bringing the summits of the floats into a right line with the distant object of vision: presented by T. N. Parker, Esq., of Sweeney Hall.—A catalogue of the Museum of the Highland and Horicultural Society of Scotland.—A complete list of the members of the Royal Agricultural Society of England, to February last; and the Transactions of the Agricultural Society of India for the previous year, from which the following is an extract:—"Mr. Tonnochy, Deputy Collector at Boolundshahur, informed the Secretary of the Agricultural Society at Calcutta, that an opulent Zemindar of his district, Mahommed Ehadoollah Khan of Khanpoor, had requested him to procure him a thrashing-machine from England, and had placed in his hands the requisite funds for this purchase. The secretary of that society had accordingly taken the necessary measures to procure from Messrs. James Milligan, of Carlisle, a three horse-power thrashing and dighting machine. Mr. Tonnochy stated that such a machine would prove of the utmost value to the agricultural interest of that country; nothing bearing more heavily on the agriculturist and retarding his progress in a greater degree, than the time, labour, and expense attending the treading process, which, for the Rubbee harvest alone, occupied both men and cattle no less a time than from forty to fifty days, with ruin staring the farmer all this time in the face, it not unfrequently happening that a heavy fall of rain, or the early setting in of the rainy season, either destroyed his grain by a general flooding of the country, or so damaged it as to render it unfit for the market; in either case disabling him from paying his rents. Mr. Tonnochy thought that a remedy might perhaps be pointed out in the stacking system, but besides that the native agriculturist and farmer is too poor to allow his grain to remain on hand, and the rents are required to be paid immediately after the crops are reaped, he must of necessity thrash the principal, or Rubbee, harvest at the season in which it was at present done; being ever after eternally employed in ploughing for both the Rubbee and Khureef harvests; in manuring, sowing, weeding, and irrigating, and in getting in the produce of the Khureef, and in the same processes for a neutral harvest, including sugar-cane, which rich lands combining other advantages yielded. Such being the case, it might easily be seen of what importance the thrashing-machine must prove; Mr. Tonnochy adding, that he could speak positively for his own country of Boolundshahur, that its successful operation at a single place, and its capability of fulfilling the promise held out by Dr. Jamieson, in the table given in his "Dictionary of Mechanical Science" (which Mr. Tonnochy had consulted), would be the means of its general introduction on the estates of the great landholders, and that it could not fail in due course to spread far and wide.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

April 20.—The first Flower Show of the above Society was held at the Horns Tavern, Kennington. The following is the result of the meeting, which was very numerously attended; and many of the plants exhibited were in high perfection. The Royal Adelaide Cup was awarded to Mr. Atlee, for the best collection of miscellaneous plants. The Silver Cup, given by Messrs. Dickson, for the four best Auriculas, viz., green, grey, white-edged, and self-coloured, was gained by J. Chapman, Esq., with Taylor's Glory, Page's Champion, Conqueror of Europe, and Potter's Cardinal de Fleury. MEDALS.—1st Class.—Best pair of Auriculas, large silver, Page's Champion, Grimes' Privateer, Mr. Schroder: 2d best ditto, middle silver, Page's Champion, Grimes' Privateer, Mr. Lidgard; 3d best ditto, small silver, Page's Champion, Dickson's Duke of Wellington, J. Chapman, Esq. For the best collection of six ditto, middle silver, Oliver's Lovely Ann, Lancashire Hero, Taylor's Glory, Grimes' Privateer, Page's Champion, Flora's Flag, Mr. Lidgard. For the best 12 Heartsease, small silver, Mr. Fyffe. 2d Class.—For the best collection of miscellaneous plants, 24 pots, large silver, Mr. Coutts; 2d best ditto, middle silver, Mr. Bruce. For the best 24 Heartsease, small silver, Mr. Hancock. 3d Class.—Best pair of Auriculas, large silver, Page's Champion, Hodges' Britannia, Mr. Dickson; 2d best ditto, middle silver, Hudson's Apollo, Kenyon's Ringleader, Mr. Gaines. Best miscellaneous collection of 24 plants, large silver, Mr. Jackson; 2d best ditto, middle silver, Mr. Pawley. Best 24 Heartsease, small silver, Mr. Thompson. MISCELLANEOUS.—Best seedling Auricula, small silver, Chapman's Sarah, J. Chapman, Esq. Best seedling Polyanthus, second small silver, Mr. Willmer; best specimen ditto, third small silver, Mr. Lidgard; best 12 ditto, dissimilar, small silver, Mr. Willmer. Best specimen plant, middle silver, Erica elegans, Mr. Jackson; 2d best ditto, small silver, Erica aristata major, Mr. Dickson. Best four sorts of Vegetables grown in England, small silver, Mr. Martin. EXTRA PRIZES.—Large silver medal given by J. Burrup, Esq.: best 12 Auriculas, Gorton's Champion, Wood's Lord Lascelles, Oliver's Lovely Ann, Hughes's Pillar of Beauty, Page's Duchess of Oldenburg, Conqueror of Europe, Page's Champion, Lancashire Hero, Dickson's Duke of Wellington, Taylor's Glory, Dickson's Earl Stanhope, Franklin's Bellona, Mr. Dickson. Of the Victoria coronation medals, given by J. Chapman, Esq., the first, for the best four Auriculas, was awarded to Mr. Dickson: the second, for the best pair of ditto, to Mr. Lidgard. The Auriculas were much finer than could have been expected after such continued unpropitious weather; and amongst the miscellaneous plants were many beautiful specimens, particularly Borónia pinnata and Azálea índica alba, in Mr. Atlee's collection; Cýtisus fílipes, Erica princeps, var., and various other Heaths, in Mr. Jackson's; Azálea índica coccínea, Acácia armata, and several specimens of Azálea índica alba, in Mr. Coutts'; Erica grandinosa, E. múndula, Helichrysum speciosum, and Bossiæa rufa, in Mr. Bruce's; and Erica ardens coccinea, E. linnœoides, and a well-flowered plant of Chorozema várium, in that of Mr. Pawley. The collection of Heartsease shown by Mr. Thompson contained some exceedingly fine blooms. From Mr. Gaines were six pretty seedling Rhododendrons, varying from delicate white to a dark rose-colour. Mr. Ivery also sent a good collection of seedling Cinerárias. From Mr. Cuthill were some of his Black Spine Cucumber; and from Mr. Gaines, a collection of very superior vegetables.

FLORICULTURAL SOCIETY.

April 19.—Mr. W. Masters in the Chair. The portion of Mr. Dickson's paper on the Auricula, relating to properties, was read by the Secretary previous to the discussion. The following properties were then agreed to, viz.—That the tube should be round, yellow, and well filled with anthers; paste circular, dense, pure white, and equally distributed; the ground should be of a rich and bright colour, with the edge, whether white or green, of an equal width round the margin of the flower; pips of an average size; segments round, firm, flat, and very slightly indented. The stem should be strong enough to bear the weight of the flowers without support, and sufficiently long to carry the truss well above the foliage. The colours should not be liable to fly, as that would materially affect the value of the flower; there were some kinds for instance, Stretche's Alexander, which would fly in three or four days after opening; and many which on the day of exhibition might possess good and distinct colours, would in a few days be comparatively worthless. The flower should be divided into four equal parts; the tube one-fourth of the diameter, the paste one-fourth, the ground colour one-fourth, and the edging one-fourth. Mr. Groom here handed in a diagram. in which the flower was divided into thirds; one-third of the diameter to be allowed for the tube, one-third for the paste, and the remaining one for the ground and edging, which, he contended, were the proper proportions. It was finally agreed that the relative proportions should be fourths. Mr. Bowler then commenced his remarks on Mr. Groom's paper on the Tulip, from which he differed in many material points; prefacing his account with a short notice of its physiological structure. He observed that Mr. Groom had recommended a semi-oblate spheroid as the most perfect form, which, in his (Mr. Bowler's) opinion, was the very worst that could possibly be, not having sufficient power to retain its general outline; neither should the pole be depressed—in our best flowers it was not. He did not agree with Mr. Groom that the petals should have a gradual swell; this, with a semi-oblate spheroidal form, would produce quartering, and convert a beautiful outline into the resemblance of a common brace made by an unskilful hand. In his opinion the semi-globular was the more preferable, and was the medium form of all our best Tulips. It had been remarked that the third of a globular ball would represent the best shape; but he had never met with it, and in his idea it would present a meagre form. The edge of the petals should be unbroken; their greatest width near the top, which would prevent all quartering (a term which in reality meant dividing into four, whereas the Tulip parts into six, and it would be better, in his opinion, if sextalising, or some more proper term, were substituted), which is, however, greatly counteracted by night covering. Sometimes the sepals fall first; at others, as in Rose Brilliant, petals and sepals fall together. With respect to colour, that of the ground is an important object; it varies from white to an intense yellow; the pure white and bright yellow being the best. The feather, whether broad or narrow, should be insensibly lost toward the centre of the petal in the ground-colour, and forming fine unbroken lines, either alternately yellow and black, or white and rose. The true flame consists of a mass of colour in the centre of the petal, having an irregular and angular outline; it is usually associated with the feather, but it is impossible to combine it with the broad feather. The starry bottom is too well known and appreciated to need much description; a flame without a feather often has the appearance of a star, although the absence of it was not necessary to form a star. He did not agree that flushing of colour was caused by damp, since as many flowers flushed in the open border as in the stage; in many it was an inherent quality, the effect only being known, and not the cause. For colour, cleanliness, and texture, he would mention Cerise blanche, and Gloria mundi, which had always been appreciated and held their place, while thousands of others had been thrown away. In the former the cuticle was particularly beautiful, and gave it that fine glossy appearance which it possessed; and also in Rose Brilliant, which has stood the test of 30 years.—Mr. Groom then said that he had been called upon on a former occasion to state his opinion, and he would still maintain that the form he then produced was good; that without a swell at the base of the petal, a flower would be imperfect—in fact, that Polyphemus and all our best flowers possessed it.—Mr. Bowler contended that form was not the most essential property, instancing flowers that had stood the test of years owing to the beauty of their colours.—It was the opinion of Mr. Groom that if the form of any Tulip was imperfect, no matter what other good properties it might possess, that flower could not be a good one. After various observations, it was decided that the subject should be open for further discussion, when flowers could be procured to illustrate the respective arguments.

COUNTRY SHOWS.

Kent and Canterbury Horticultural Society.—On April 7th the first exhibition took place at the Corn Exchange, and was numerously attended. Among the plants best worthy of notice were a Siphocámpylus and an Azálea Smíthi from Mrs. Webb; a collection of succulents, including a handsome specimen of Euphórbia splendens in bloom, from J. G. Shepherd, Esq.; and some Cinerarias and Hyacinths from G. Buckley and T. King, Esqrs. Nearly half the rare plants in the show were sent from the nursery of Ald. Masters, whose collection included many Acacias, Camellias, and several gorgeous varieties of Rhododendron arbóreum. The following is a list of the prizes:—Fruit.—Best plate of Strawberries, Rev. W. Brockman. Best eight Dessert Apples (Nonpareil), R. Francis, Esq.; second best ditto (Hicks' Fancy), Rev. H. Plumptree. Best six Kitchen Apples (Castle Major), R. Francis, Esq.; second best ditto (French Crab), Rev. J. P. Marsh. Best six Pears (Easter Beurré), R. Francis, Esq.; second best ditto (Beurré Rance), ditto. Vegetables.—Best brace of Cucumbers, E. Knight, Esq.; second best ditto, Rev. C. H. Hallett. Best thirty Kidney Beans, Rev. W. Brockman. Best six stalks of Rhubarb, E. Knight, Esq. Best three Lettuces, Mr. R. Filmer. Best three Endives, Rev. W. Brockman. Best two heads of Broccoli, T. Dorman, Esq. Best six heads of Seakale, J. Cates, Esq. Best basket of Salading, without Cucumbers, Mrs. Webb. Best basket of Mushrooms, Mrs. Ramsay. Flowers.—Best China Rose in pot (Fairy), Mrs. Webb; best three summer Roses (Provins), ditto; best three stove plants (Euphórbia splendens, E. Bojeri, Opuntia), J. G. Shepherd, Esq.; best single ditto, ditto; best four greenhouse plants, not Erica, Camél-lia, or Pelargonium (Siphocámpylus bícolor, Pultenæa daphnoides, Anthocercis viscosa), Mrs. Webb; best three ditto, T. Dorman, Esq.; best two ditto (Polygala grandiflora, Kennédya rubicunda), Miss Flint; best two Orange-trees in fruit (Myrtle-leaved), Mrs. Webb; second best ditto, ditto; best single ditto, T. Dorman, Esq.; best three Caméllias, in blossom (double white, althæiflora, old double red), G. Buckley, Esq.; second best ditto (Donckelaerii, serratifólia, and bícolor), J. G. Shepherd, Esq.; best two ditto (myrtifólia, double white), G. Neame, Esq.; best one ditto, J. G. Shepherd, Esq.; best two succulents in flower (Céreus senilis, Echinocactus scopa), ditto; best six ditto, without restriction, ditto; best two Indian Azaleas, in blossom (Alba, phœnícea), Mrs. Webb; second best ditto (Alba, Smíthi), ditto; best four varieties of Cape Heaths, ditto; best four varieties of Cape Bulbs, ditto; best six Hyacinths (Voltaire, Mons. de Faisch, La Dame du Lac, Mad. Talleyrand, Grand Vainqueur, Duke de Berri), T. King, Esq.; best four ditto (double Waterloo, Pyrene, Bouquet Royal, Bouquet Pourpre), T. King, Esq.; best four single, G. Buckley, Esq.; best two ditto (Queen Victoria, Van Speyk), T. King, Esq.; best three Cinerarias (King, Hendersonia, Waterhouseana), Rev. W. Brockman; best two ditto (Cissa, Waterhouseana), ditto; best two Wallflowers, grown in pots, T. Dorman, Esq. Extra.—Rhododendrons (arbóreum, catawbiense, Smithii), J. G. Shepherd, Esq.; Cape Heath, G. Neame, Esq.; two greenhouse plants (Chorozema várium), J. Cates, Esq. Cut Flowers.—Best three Caméllias, J. G. Shepherd, Esq.; best two ditto, G. Buckley, Esq.; best basket of single Anemone, Miss Flint; best basket of cut flowers, Rev. G. P. Marsh. Extra.—Nosegay, Rev. W. Brockman.

Winchester Polyanthus Show.—This exhibition took place on Thursday, April 21. The following were the successful competitors:—First prize, Mr. Foster; 2d, Mr. Wever; 3d, Mr. Young; 4th, Mr. Jas. Sheppard; 5th, Mr. Shenton; and 6th, Mr. Hyller. The maiden prize was gained by Mr. Jas. Pattison.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Mi'mulus róseus, var. Maclainianus. Mr. Maclain's hybrid rose-coloured Monkey-flower. Scrophulariáceæ. Didynámia Angiospérmia. (*Stove Herbaceous Plant.*)—Beautiful as are the now well-known species of Mímulus from California, M. róseus and M. cardinalis; this, we think, exceeds them both in the size and rich colouring of the flower. It was raised by Mr. Maclain, florist, Harold's-cross, near Dublin, who says that it succeeds best when grown in a light, rich compost, a pan of water being placed under the pot, and kept in the stove. The flowers do not bear exposure to the sun.—*Bot. Mag.*

Aca'cia platy'ptera. Broad-winged Acacia. Leguminosæ. Polygámia Monœ'cia. (*Greenhouse Shrub.*)—This beautiful Acacia compensates for the absence of leaves in the quantity and rich yellow colour of its heads of flowers, which are copiously produced on the younger branches. It is a native of Swan River, and flowered first with Messrs. Lucombe and Pince, at Exeter, and subsequently with Mrs. Wray, at Oakfield, Cheltenham, and Mr. Low, Clapton. It is a peculiarly free-flowerer, and a most desirable greenhouse autumnal blossoming plant.—*Bot. Mag.*

Oxalis lasiope'tala. Hairy-petaled Wood-sorrel. Oxalidaceæ. Decándria Pentagýnia. (*Greenhouse Herbaceous Plant.*)—Seeds of this pretty species were sent by Mr. Tweedie from the neighbourhood of Buenos Ayres and Monte Video to the Glasnevin Botanic Garden, where it produced its bright red-purple flowers abundantly in the greenhouse. The roots are tuberous, and the leaves, calyx, and outer side of the petals hairy.—*Bot. Mag.*

Gastrochilus pulche'rrimus.—Handsome-flowered Gastrochilus. Scitamíneæ. Monándria Monogýnia. (*Stove Herbaceous Plant.*)—A native of Rangoon, in the East Indies, where it flowers in August, and whence plants were sent to the Royal Botanic Garden, Kew, where they blossom at the same time, by Dr. Wallich. The blossoms are very handsome and graceful, and at first sight give the idea of some Orchidaceous plant; they are white or cream-coloured, with a crimson spot on which are two white streaks. It requires the heat of a stove, and seems to thrive well with the same treatment as is given to Orchidaceous plants.—*Bot. Mag.*

MISCELLANEOUS.

Manures.—At a late meeting of the Ashmolean Society, Professor Daubeny exhibited a specimen of Mr. Daniell's New Patent Manure, which is stated by the inventor to consist of carbonate of ammonia, sawdust, and bituminous matter. As the materials from which this new kind of fertiliser is drawn appear to consist of inorganic matter exclusively, Dr. Daubeny pointed out its discovery as an instance, amongst many others, of the means which nature has placed within our reach for increasing the amount of vegetable produce proportionately to the increase of mankind, and so maintaining the necessary ratio between subsistence and an increasing population. In a purely pastoral or agricultural community it might be unnecessary to have recourse to any other fertilising substances than those which the manure of animals affords; but in a highly-advanced condition of society, in consequence of the large amount of produce consumed by the inhabitants of the great towns, it becomes necessary to seek for new materials to supply the loss which the soil of the country sustains. Thus bone-dust is procured from South America in such quantities, that it is computed, on the calculation that each head of cattle supplies bony matter equal to 84 lbs. in weight, that not less than one million two hundred thousand oxen are slaughtered annually in that country for the supply of bone-manure to England alone. Guano, or the dung of sea-birds, is likewise an extensive article of importation for the same purpose; but as both these sources will fail in proportion as the several countries become more peopled, it is fortunate that we may find substitutes for them in inorganic substances. Such is the nitrate of soda, so much used of late; such is the new manure invented by Mr. Daniell; and it may be confidently predicted, that by the discovery of such agents, agriculture will be enabled to keep pace with the increase of population, if the latter be not stimulated by unwise regulations; and that as animal life increases in a direct ratio to the amount of subsistence, so the nutritious effects of animal manure, by giving greater energy and vigour to the organs of plants, will cause them to draw more abundantly from the atmosphere, and thereby force a proportionately larger quantity of them into existence. Dr. Buckland thought that an important principle, respecting stimulating manures, had been brought forward, viz., that a plant, under their action, draws more freely from the atmosphere. In addition to the increase of human manure with population, the quantity of carbon given out by animals, and left to be absorbed by plants, is proportionately increased. He further adverted to the discrimination necessary to be exercised in restoring artificially land that has been exhausted, and instanced a case furnished by Professor Johnston, of Durham, of certain pastures in Cheshire, which had become exhausted of their phosphate of lime by its being absorbed into the cheese made with the milk of the cattle fed there, and which were restored by a top-dressing of bone-manure.—*Athenæum.*

Mr. Lambert's Sale.—The botanical books of this gentleman have this week been brought to the hammer. Considering that they were dirty, and in many cases by no means in good condition, the prices they realised are remarkable. The following are the sums for which some of the more striking lots were sold:—Don's System of Botany, 4 vols. 4to, fetched 4*l.*, which is just twice the price at which new copies can now be had. The Duke of Bedford's Salicetum Woburnense, with 130 coloured plates, 10*l.* 15s.; of this book only 50 copies were printed. The Pinetum Woburnense, with 67 coloured plates, 8*l.* 8s.; of this 100 copies were printed. Dr. Brown's Prodromus Floræ Novæ Hollandiæ, 1810, with several tracts on Botany, 16s. A complete copy of Curtis's Botanical Magazine, consisting of 67 vols., 20*l.* 15s.; Edwards's Botanical Register, 27 vols. half-bound, 21*l.* 10s.; Elliott's Botany of South Carolina, 2 vols., 1*l.* 11s.; Andrews's Botanical Repository, 10 vols. 4to, 7*l.* 5s.; Blume's Flora Javæ, 3 vols. fol., half-bound calf, with 197 coloured plates, 9*l.* 15s. A fine copy of Catesby's Natural History of Florida, 16*l.*; it was a presentation copy to Peter Collinson. Cavanilles's Icones et Descriptiones Plantarum, with 600 plates, in 6 vols. calf, 8*l.* 10s. 6d.; Decandolle's Histoire Naturelle des Plantes Grasses, with 166 coloured plates, in 3 vols., 3*l.* 10s. The first 6 vols. of the Flora Græca, 22*l.* 10s. The Hortus Malabaricus, with 700 plates, in 12 vols., only 7*l.* 12s. 6d., though the same work has fetched between 40 and 50 guineas. Hooker's Exotic Flora, with upwards of 230 coloured plates, 3 vols. 8vo. russia, 3*l.* 16s.; Llave and Lexarza's Novorum Vegetabilium Descript., 2 parts, a very rare work, with two other volumes, 17s. Michaux's North American Sylva, 2 vols. in 4, half-bound in calf, with 156 coloured figures, 9*l.* 10s.; Gærtner de Fructibus et Seminibus Plantarum, 3 vols., 225 plates, 4*l.* Humboldt and Bonpland's Voyage (Partie Botanique), 7 vols. 4to, in russia, with 700 plates, 7*l.* 10s.; Jacquin's Collectanea, 5 vols., with 109 coloured plates, 3*l.* 3s.; Labillardière's New Holland Plants, 2 vols., with 265 plates, 2*l.* 3s. Humboldt and Bonpland's Plantes Equinoxiales, 2 vols. imp. fol., calf, with 144 plates, 3*l.* 8s.; the Monographie des Melastomacées, 2 vols. imp. fol., half-bound in russia, with 120 coloured plates, 4*l.* 16s.; the Mimosæ, imp. fol., half-bound in russia, with 61 coloured plates, 4*l.* 13s.; Jacquin's Icones Plantarum Rariorum, 3 vols. fol., bound in 6, with 648 coloured plates, 8*l.*; the Hortus Schœnbrunensis, 4 vols. fol., half-bound in russia, with 500 coloured plates, 7*l.*; Flora Austriaca, 5 vols. half-bound in russia, with 500 coloured plates, 9*l.* 5s.; the Fragmenta Botanica, with 138 coloured plates, atlas folio, 4*l.* 7s. Two copies of Lambert's Genus Pinus, in 3 vols. imp. fol., half-bd., sold, one for 35*l.* and the other 36*l.* Lindley's Digitalium Monographia, 28 coloured plates and one drawing; Bauer's Illustrationes Floræ Novæ Hollandiæ, with 15 col. plates and 2 drawings, 2 vols. in 1, half-bound in calf, brought 9*l.* 5s.; Palisot de Beauvois Flore d'Oware et de Benin, with 120 coloured plates, 2 vols. fol., half-bound in calf, 5*l.*; Plumier's Botanicum Americanum, four royal folio volumes of drawings, many in colours, with a manuscript volume of descriptions, 18*l.* 10s. Rivini Opus Botanicum, consisting of 385 plates and 135 pen-and-ink drawings, in 4 vols., 3 in calf, and 1 half-bound, 8*l.* 18s. 6d.; Roscoe's Monandrian Plants, with 112 coloured plates, atlas folio, 12*l.* Sowerby's English Botany, in 36 vols., bound in calf, 29*l.*; Sweet's British Flower-Garden, in 7 vols., half-bound in calf, 6*l.* 2s. 6d.; Watson's Dendrologia Britannica, 2 vols., with 172 coloured plates, 3*l.* 11s. Martii Nova Genera et Species Plantarum, with 231 coloured plates, 2 vols. and Part 1 of Vol. 3, imp. 4to, 2 in russia, and 1 in boards, 16*l.*; Royle's Illustrations of the Botany and other branches of Natural History of the Himalayan Mountains, 9*l.* 15s. Ruiz and Pavon's Flora Peruviana, in 3 vols., with 176 unpublished plates of the 4th and 5th volumes, sold for 27*l.* Wallich's Plantæ Asiaticæ Rariores, with 300 coloured plates, in 3 vols. imp. fol. half-bound in calf, 14*l.* 10s. The proceeds of the sale amounted to about 1100*l.*, and the principal purchasers were booksellers.

GARDEN MEMORANDA.

J. Allcard, Esq., Stratford-green.—The Orchidaceæ are in a flourishing condition, and many kinds give promise of flowering during the summer in great profusion. Roots of the flowering Fern, Osmunda regalis, have, in several instances, been used to grow them on instead of blocks of wood, and the epiphytes apparently like their habitation; in most cases the Ferns have produced fronds, which afford a beneficial shade to the Orchidaceæ. Saccolábium micranthum was growing freely on a Fern, and had thrown out several racemes of its delicate lilac and white blossoms; Oncídium púmilum, in a similar situation, will also soon be in full bloom. Over the roof of the house Vanilla planifólia is trained; it will soon be nearly covered with flowers, as buds are developed at the axil of almost every leaf; but the most singular circumstance is connected with the roots, which depend from the roof to the ground like ropes. Dendróbium fimbriatum, one of the most splendid species, presented a mass of rich orange colour; and though not so showy, the yellow variety of D. Pierárdi attracted our attention by the elegance of its growth. Several Gongoras were in fine perfection, and peopled the house with insects of the strangest forms; Brássia verrucosa has produced flower-stems nearly 5ft. long, and B. caudata has also grown very strongly. Last year a number of Cape Heaths were planted out in a bed on the lawn for the summer; they were covered with a mat during the winter, and most of the plants have survived; the sorts which are the least injured are viridiflora, vestita coccínea and another variety, Bowieana, læta, cóncolor, and persoluta; there are also two strong specimens of Sebana, one of which has survived unharmed, while the other is killed. In the Vinery, which is built on the ridge-and-furrow system of Mr. Paxton, there is an excellent show of Grapes, and a large crop of well-forced Strawberries. Near the Vinery a pit, also on the ridge-and-furrow system, has been erected; it is used for wintering plants in, and has answered admirably; the triangular pieces of wood, which form the back and front of each ridge, take out, and thus good ventilation can be given in wet or windy weather, without any injury to the plants in the frame.

Reviews.

The Journal of the Royal Geographical Society of London. Vol. XI., Part 1.

The first section of the present volume contains an interesting account by Mr. Ainsworth of an excursion through various parts of Western Asia, during which he, in company with three other gentlemen, visited Kal'ah Sherkát (the Ur of the Persians), and the ruins of Al Hadhr (the Hutra of the Chaldees and Hatra of the Romans). In this narrative, Mr. Ainsworth has not only described the situation and appearance of those places which he visited, but also the general aspect of vegetation which he observed in his route. After leaving the city of Mósul, he crossed a cultivated alluvial plain, named the Karakójah. At that season of the year (April 18th) barley was in ear, and

Beans in flower; Fig, Almond, and Mulberry trees were in full bloom; but the Pistachio as yet only budding; while on the sandy deposit of the river the Water-melon had put forth its seed-leaves. To the N. W. of this plain is a low range of hills, known as the Jubaïlah, which was then clad with a beautiful verdure. Grass was abundant, and the greensward was checkered with red Ranunculuses and composite plants of a yellow hue, which enlivened the stony banks of the Tigris and Euphrates. Of the great tracts travelled over on this excursion, scarcely any spots were met with actually deprived of vegetation. On the most naked were a few Lichens, amongst which were principally a grey Lecidea with black raised apothecia, and a pink-coloured Cetrária; with a few pseudo-Lichens, chiefly Verrucária maura and V. epigea. Of the gramineous plants, Oat-grass was by far the most abundant, covering whole uplands of miles in extent, to the exclusion of everything except a few flowering plants, which at that time were Ranúnculus asiáticus and certain species of Hierácium and Crepis. The beautiful Chrysánthema and Gnaphália, which, with a few Centaureæ, adorn the wilderness in summer, had not then come into bloom. In the drier parts of the plains, Lichens were more plentiful than Grasses; but the most prominent plants were species of Wormwood. Among the social plants were the gay Aster pulchellus, Allium róseum (everywhere), Papaver dúbium, Campánula glomerata, and Gentiana campestris. On the more fertile spots were Roméria hýbrida, Mathíola vária, Matricária chamomilla, Anthemis nóbilis, and two species of Eródium. The family of Leguminosæ was represented by the genera Cýtisus and Vícia, and that of Caryophylleæ by a few species of Saponária and Silene. Upon entering the country of cultivating tribes, new species, unknown in the wilderness, made their appearance, especially Tróllius asiáticus, a yellow variety of Ranúnculus asiáticus, but rare, Adonis flava, Ornithógalum umbellatum, Gladíolus ségetum and G. byzantinus, Iberis saxátilis, Caléndula officinalis, Malva rotundifólia, Convólvulus althæoides, &c. It is singular that so many of the phanerogamous plants of these countries should be British species; of about 40 collected by Mr. Ainsworth near Mósul, upwards of 30 were familiar or wayside plants.

The second section of this volume gives a description of a visit to the Chaldeans inhabiting Central Kurdistán, and and of the ascent of the Peak of Rowándiz (Túr Sheïkhiwá), in the summer of 1840, by the same gentleman. After leaving Mósul, he travelled across the plain of Nav-kúr, which, except where cultivated, is almost entirely overgrown with species of Glycyrrhiza and Artemísia, and certain social umbelliferous plants. At 'Aïn Siffín a slight change in vegetation was perceptible. The common Thorn here made its appearance; and the rivulets were adorned with the bright pink blossoms of the Oleander, and afforded Water-cresses, a luxury abundant throughout Kurdistán, though unknown in Mesopotamia. On entering the hills, a remarkable increase of animal and insect life was observable. Large snakes, of an ash-grey colour, were very common, and were seen engaged in captivating the beautiful lizards of the country; coleopterous insects, of brilliant colours, basked on the flowering plants; and a yellow caterpillar, with bright scarlet spots, from 3 to 4 inches in length, occurred on a species of Euphórbia. In the valley of Amádíyah, which, though containing many villages, is sparingly cultivated, are large forests of Valónia Oak, stretching more particularly along the eastern foot of the Túrá Gharah, from hence to Rowándiz, a distance of three days' journey; this being the great district for gathering galls and valónia. From inquiry, Mr. Ainsworth learned that the cup of Quercus valónia was alone gathered for the market, but that galls were obtained both from the Q. valónia and other oaks. Although he did not see them in the act of gathering, yet the trees pointed out to him as furnishing galls were Q. Cerris, pedunculata, and infectória. The Gall Apple, which is known to be the product of a species of Cynips, is only gathered from the stalks or stem; that on the leaves is pulverulent and useless. The zone of Oak in these mountains extended from an elevation of 1500 to 2500 feet above the level of the sea; above and below this the trees became mere shrubs. To the N. of Amádíyah, Mr. A. came to the pass of the Matíneh mountain, which he describes as exceedingly beautiful. Near its foot a mountain torrent came tumbling over the rocks, amid precipitous cliffs, variegated by a rich vegetation and long-pending stalactites, or a rough covering of travertino deposited by the waters; climbing and creeping plants swung in flowery festoons down to the water's edge, petrified in their course, and their foliage was rivalled in various tracery by the stalagmitic deposits; an ash-coloured snake, having bright yellow bands, waved itself occasionally up the smooth and perpendicular face of the rock. At Lizán every available plot of ground was cultivated in terraces, rising one above the other, and the rocky interval that separated them was covered with fruit-trees or tall Poplars for building.

The system of irrigation practised on these terraces was very perfect: 25 were counted sown with rice (their common crop), all under water at the same time. Near the snow line, on the crest of Kurríkí, was a vast growth of Fennel, which a number of peasants were occupied in cutting for their winter stock of cattle provender. When green it is chopped and put into sour milk, to which it gives a pleasant aromatic flavour. Two species of Fennel abounded here, and it was remarkable that they respectively favoured opposite sides of the mountains. With them grew Alchemilla alpína, Trifólium alpestre, Stachys alpina, and a Lobélia. "These heights were now," says Mr. Ainsworth, "arrayed in their most attractive green, and the relief to the eye was very great." On the sides of the Zómá Survarri a considerable change in the vegetation was observable; indeed every range was characterised more or less by the preponderance of certain forms over others, and the vast numerical increase of a few social species. Here the Astrágalus tragacantha (great Goats'-thorn), Tragopogon orientalis (Goats'-beard), and Rhamnus saxátilis (the berries of which are used by the Easterns to dye leather yellow), excluded almost every other plant. The latter must not, however, be confounded with the yellow berry of commerce, which is the produce of R. catharticus.

"It is remarkable of the Tragopogon orientalis that its geographical distribution is very various; and that, though abounding on the plain of Adiabene, it yet does not cross the Tigris. Its white stem when first pushing out in spring is abundant in the market of Mósul, where it is brought from the plains E. of the Tigris; and, although wild, it is incomparably the best vegetable which this country affords. The stem makes a pleasant salad, and in the mountains is peeled and eaten raw."

In an alpine valley, at an elevation of 6,200 feet, is situated the village of Malótah. The only refreshments that could be procured there were the stems of Fennel and stalks of Rhubarb, the acidity of which was very pleasant. The land around was partly cultivated and partly covered with snow; the remainder overgrown with rank vegetation, chiefly of umbelliferous plants; amongst them were, however, to be seen the Crown Imperial, Pæony, and Asphodel. Whilst at Tyárí, the Melik, observing that Mr. Ainsworth had been collecting plants, presented him with a gorgeous specimen of a scarlet Cypripédium (C. macranthum ?) which grew in shady places near the snow-line. In the marshy spots near Eslayá (6,258 feet in elevation) the vegetation was very striking, especially of Prímula aurícula, of which the peasants formed bouquets. Caltha palustris, Pinguícula alpina, Verónica aphylla, Epilóbium alpinum, and many Saxifrages, Euphórbiæ, Cárices, and Grasses also abounded. On the borders of a lake near the Chaldean village of Gawalán, a dry sandy plain was covered with a species of Ononis and Mesembryánthemum, amid which, when the soil was slightly saline, predominated a species of Salsola; when very saline, a Salicórnia; when scarcely at all salt, Nigella damascena, Cápparis spinosa, and C. ovata. Thus, at an elevation of 4,300 feet, were to be seen the vegetation of Babylonia and of Mesopotamia; the Nigella, especially reminding one of Mósul; the Mesembryánthema of Hillah; but here the vegetation was more dense; and the perpetual Artemisiæ of the lower plains were a good deal replaced by Astrágalus verus and A. tragacanthoides. In his concluding remarks Mr. Ainsworth observes, that

"With respect to zones of vegetation, too interesting a subject to be neglected in twice crossing so remarkable a range of mountains, we observed one great peculiarity, which is the absence of the Coniferæ; indeed, I did not meet with a single Fir, Pine, or Laurel, in the whole range of our travels: Myrtle is also wanting. The zones of vegetation were as follows:

"1. From the plains of Mesopotamia to the height of 1,000 feet is the zone of Glycyrrhiza, Robinia, Nigella damascena, Wild Vine, Pistachio, Oleander, Roses, Plane-tree, Syringa argentea. Country of Rice, Grapes, Melons, Maize, &c.

"2. From 1,000 to 4,000 feet—zone of Oaks, Quercus valonía, Q. infectoria, &c. This is the country of Pears, Apples, Plums, &c.

"3. From 4,000 to 5,000 feet—zone of Lonicera alpigena, Jasmine, Amygdalus nana, Astrágalus verus.

"4. From 5,000 to 7,000 feet—zone of Astrágalus tragacanthus, Rhamnus saxátilis, Pæony, Fennel, Prímula auricula, Helleborus hyemalis, Crocus alpestris.

"5. From 7,000 to 9,000 feet—zone of Saxifrages, Alchemilla alpina, Gentiana asclepiades, Veronica aphylla and saxátilis, Polytrichum septentrionale."

The Elements of Agricultural Chemistry and Geology.

By J. F. W. Johnston. Blackwood, 12mo.

This is another of the excellent works which the present eagerness to improve our systems of agriculture has produced. In his "Lectures on Agricultural Chemistry," Professor Johnston has treated at large upon most of the subjects mentioned in the work before us; and, therefore, it may appear at first sight to be superfluous to those who already possess the "Lectures." We, however, do not think so; on the contrary, we regard it as an indispensable auxiliary to the larger work. It is, in fact, a compendium of the author's views, as more fully explained in the Lectures, concerning the relation of chemical facts to agricultural results: and, like all compendiums proceeding from the hand of a master, it has the very great merit of simplifying the matter treated of, and of picking out those considerations which are of most importance from such as are of secondary value only—a selection which the learner cannot make for himself. We therefore regard it as an important addition to the scientific literature of the day, and strongly recommend it to the careful study of all who wish to understand the scientific principles on which experiments in agriculture are to be conducted.

CALENDAR OF OPERATIONS *for the ensuing week.*

After this time we are not often visited by frost of sufficient severity to penetrate into the ground; therefore, as soon as fine weather appears to be set in, what remains of the coverings on the outside borders of early forcing-houses may be wholly taken away. The stems of the trees ought not, however, to be left unprotected: such parts of them as are exposed should be neatly covered with moss, or with straw tied on in the way of thatch, to remain during summer. When the roots are very near the surface of the border, the short, half-rotten parts of the dung may remain on all summer, as a protection against drought and sudden changes of temperature.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Take especial care that the roots of the plants in renewed beds do not suffer by too much heat. When the tender points of the lengthening roots are destroyed at this stage, the great check the plants receive thereby is almost certain to start them into fruit. If, therefore, the beds are found to heat violently, pour cold water upon them (but not over the roots), and lower the atmospheric temperature for a few days, by giving more air and less fire. But if the beds maintain a steady heat from 85° to 90°, at the bottom of the pots, no danger need be apprehended, and then, should the weather continue warmer, let the night temperature range a few degrees higher than that given last week. In very cold weather, such as we then had, it is much better to reduce the temperature four or five degrees below the prescribed standard for a short time than to cause a wasteful consumption of expensive fuel by keeping the houses precisely to one unvarying point.

Vinery.—Do not neglect the thinning of successional fruit as soon as it begins to swell after setting. If very large berries are desired, cut off more in proportion than when close bunches are wanted. The general size of the respective sorts must also be borne in mind when thinning, and the number of berries regulated accordingly; thus, the Frontignan and Chasselas varieties will bear at least a third more berries in a bunch of the same size than the Hamburgh and Muscat. Be very careful not to touch the fruit with sweaty hands or hair, which is one of the causes of "rust" on Grapes.

Peach-house.—The management of the early house must now be governed by the state of the fruit. If these are nearly ripe, expose them freely to the air whenever the weather is favourable, and discontinue watering. When this has been properly attended to, as heretofore advised, no further supply will be necessary till the fruit is all gathered. In dull and cold weather, gentle fires now and then will be useful to dry the house; but if the weather is fine and dry, fire-heat will not be necessary after the process of ripening commences. Use the garden-engine if red spider is observed in the later houses.

Cherry-house.—In this house the first crop will now probably be ripening, when no more water should be given than is absolutely necessary. Give air liberally, but guard the fruit against the ravages of birds.

Fig-house.—Keep a regular temperature, not exceeding 60° at night, and try to economise fuel by shutting the house up warm.

Mushroom-house.—Droppings that are in preparation for beds must be often turned, and kept in thin layers. Turfy loam, chopped into small lumps and mixed with the droppings, will encourage the spawn to run freely through the mass. Make the air of the house moist, in preference to giving much water to the beds.

Cucumbers and Melons.—Impregnate the female flowers of Melons regularly until a sufficient number of fruit is set, which must be regulated by the usual size of the kind and the strength of the plants. A few good fruit should always be preferred to a greater number of inferior ones. Sow for a succession, to fill the latest Potato-frames as the crop is cleared off.

Kidney-Beans.—Some some in pots, for planting out at the foot of a wall.

Celery.—The first-sown plants will by this time be large enough for pricking out on a bed of dung, to be sheltered by frames or hand-glasses. Spread a layer of well-rotted dung three or four inches thick on a hard bottom, make it firm and level, and then put out the plants in rows four inches apart. They will root freely into the dung, and when large enough may be transplanted with the loss of very few fibres.

Carrots, Lettuces, Potatoes, and other esculents under glass, will often require light waterings now.

Out-door Department.

Young vegetables which have been recently transplanted will require occasional waterings, should the weather continue dry. As the nights are cold, it will be better to do this either in the morning or soon enough in the afternoon, to allow the leaves to get dry before night. Advantage should be taken of fine days to destroy weeds while they are small; the great importance of *timely* hoeing cannot be too strongly impressed upon the gardener's attention.

Beet.—After the first fall of rain, sow for a principal supply.

Broccoli.—In cold, exposed places, the late sorts, for a spring supply, should now be sown; but on dry, warm soils that are favourably situated, the first week in May will be soon enough.

Cauliflowers.—Those under hand-glasses ought to have a good soaking of water now and then in dry weather; a deficiency of moisture will cause them to button.

Curled Mallow, the leaves of which are useful for garnishing dessert, should be sown.

Kidney-Beans.—Put in a few rows in a well-sheltered place.

Nasturtiums, to produce seeds for pickling, ought now to be sown.

Normandy Cress.—Sow another bed on a north border; this useful herb may generally be substituted for Mustard and Cress.

Purslane.—Sow the Green and the Golden; likewise Sweet Marjoram, Summer Savory, Sweet Basil, and all tender annual herbs, with Caraway, and other condiments. The Basil-bed may be covered with hand-glasses, or an old frame-light.

Radishes.—Sow a succession, and transplant some roots from the earliest sowings to produce pods for pickling.

Rampion.—The fleshy roots are excellent in winter salads; sow, therefore, in very light soil, covering the minute seeds as lightly as possible.

Salsafy and Scorzonera may be sown; or, like Beet, this might be deferred another week if the weather is not suitable.

Orchard.—The winter covering of Fig-trees might after this time be entirely taken away, when the trees should be pruned and nailed. In pruning, do not make too free use of the knife; the last year's wood ought not to be shortened, except where shoots are wanted to fill up vacant places. Afterwards, when frost threatens, mats may be hung before the trees in the evening, and taken down in the morning; frosts at this season would be very injurious to trees which have been protected. Pay strict attention to the disbudding of Peach, Nectarine, and Apricot trees. Removed trees should be watered, unless rain falls soon, and mulched as far as the roots extend.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Many of the plants will now require to be shifted into larger pots, and to be properly staked to form specimens. Shade during bright sunshine, but only then, as the plants may get drawn, and will not flower well if too much shaded. Orchidaceous plants which were shifted some time since should be looked over and top-dressed; keep the house very moist. In those where it is difficult to keep the air constantly damp, sphagnum is an excellent material to lay under the pipes or shelves; this can be wetted, and will then give out a constant supply.

Greenhouse and Conservatory.—If the climbers in the latter house are beginning to grow, they must be regularly attended to in tying, &c. After the Camellias have done flowering, a thorough washing with the garden-engine will benefit them; as these are now making their annual shoots, upon which the flowers of next spring will be borne, they will require a liberal supply of water at the root. Observe that the balls of Heaths, and other hair-rooted plants, are not dry at the bottom while the surface of the soil appears moist; when in that state, a hot sunny day often kills the plant suddenly. Be cautious in giving liquid manure, which should never be applied to Heaths, and plants of that class.

Pits and Frames.—If you are short of room, wintered plants of Fúchsias, Hydrángeas, and other comparatively hardy things, may be set out in a sheltered place, beneath a temporary roof of boards or mats. As the time for bedding out is approaching, all plants intended for that purpose should be made as hardy as possible by free exposure whenever practicable. Shade fine Auriculas and Polyanthuses in bright sunshine. (In p. 240, for "partial air in bright weather," read "partial shade in bright weather.")

Out-door Department.

If the first-sown annuals have come up, they will require some attention in watering during dry weather. A few branches of evergreens stuck round them will supply both shade and shelter. Take advantage of the first rains to plant out the most forward annuals from the frames. Tender climbing ones, such as Convólvulus major, Tropæ'olum aduncum, &c., should be sown in pots, and forwarded a little, for which it is not yet too late, if not already done.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Attend to the watering and weeding of young seedlings. The more valuable species may be shaded with Fir branches, which will also protect them in cold nights. Look over grafts now and then, and fill up all cracks in the clay.

Forest and Coppice Woods.—The felling and peeling of Oak should now be proceeded with. To obtain timber of the best quality, the trees should be peeled standing, and not be cut down till next winter.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending April 21, 1842, as observed at the Horticultural Garden, Chiswick.

April		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	15	30.068	30.052	51	36	43.5	N.E.

The highest temperature during the above period occurred on the 30th, 1827—thermometer 78°; and the lowest on the 25th, 1827, and 26th, 1835—thermometer 25°.

REPORT ON COVENT GARDEN MARKET,

For the week ending April 22, 1842.

The supply of vegetables during the past week has been limited, and the price of most kinds proportionately high; fruit is more plentiful, and most of that offered is of a good quality. Trade, in general, has not been at all brisk.—*Fruit.* The supply of Pines is on the increase, their price varying from 10*s.* to 16*s.* per lb. Forced Grapes have appeared during the week, chiefly Black Hamburgh and Dutch Sweetwater, at from 12*s.* to 20*s.* per lb. Peaches and Nectarines are selling from 24*s.* to 42*s.* per doz.; and Cherries have risen to 25*s.* per lb. Pears, chiefly Beurré Rance, are becoming more scarce, and fetch from 7*s.* to 8*s.* per doz. Apples are plentiful; some fine samples of the Golden Knob, and other dessert kinds, fetch from 6*s.* to 13*s.* per bushel; Nonpareils, 15*s.* to 40*s.* The price of Strawberries is much the same as in our last Report; some of those offered have been particularly fine. Of Cucumbers there is a pretty good supply, from 2*s.* to 6*s.* per brace.—*Vegetables.* Broccoli has been very scarce during the past week; and the demand for Asparagus has been greater than the supply: the price still continues very high; good bundles of the forced averaging 15*s.*, those of the natural 20*s.* New Potatoes have somewhat risen in price, varying from 1*s.* 6*d.* to 4*s.* per lb. Sea-kale is plentiful, and has become rather cheaper, fetching from 9*d.* to 1*s.* 6*d.* per punnet. The supply of Endive and Lettuce is very good, and plenty of every description of salading may be obtained. Rhubarb is more plentiful, but the price is much the same as in our last account.

PRICES Saturday, April 23, 1842.—FRUITS:—

Apples, Kitchen, per bush. 4*s* to 7*s*
— Dessert, per bushel, 5*s* to 14*s*
Pears, dessert, per half-sieve, 5*s* to 21*s*
Strawberries, forced, per oz., 6*d* to 1*s*
Peaches, per doz. 24*s* to 42*s*
Nectarines, per doz., 24*s* to 42*s*
Pine Apple, per lb. 10*s* to 16*s*
Cherries, per lb. 25*s*
Grapes, hothouse, per pound, 12*s* to 20*s*
— Spanish, per lb., 1*s* 6*d* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 6*s* to 18*s*
— Bitter, per 100, 8*s* to 20*s*

Lemons, per doz. 1*s* to 2*s*
— per 100, 5*s* to 14*s*
Cucumbers, per brace, 2*s* to 6*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 6*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, Eng., per 100lbs., 150*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, Red, for pickling, 2*s* to 3*s*
Cabbage Plants, per doz., 3*s* to 6*s*
Broccoli, White, p. bnch., 1*s* to 3*s*
— Green, 9*d* to 1*s* 6*d*
— Sprouts, per sieve, 1*s* 6*d* to 2*s*
Kidney Beans, forced, p. 100, 2*s* to 4*s*
Potatoes, per ton, 50*s* to 100*s*
— per cwt. 2*s* 6*d* to 5*s*
— per bushel, 1*s* 6*d* to 3*s*
— Kidney, per bush. 2*s* 6*d* to 3*s*
— New, per pound, 1*s* to 4*s*
Turnips, per dozen bunches, 2*s* to 3*s*
Carrots, per doz. bunches, 5*s* to 6*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s* 3*d*
— Turnip, per doz. bch., 2*s* to 3*s*
Spinach, per sieve, 1*s* 6*d* to 2*s* 6*d*
Chives, per pot, 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb. 8*d*
Shallots, per lb., 1*s* 4*d*

Onions, per half sieve, 3*s* to 4*s*
— for pick., per hf.-sieve, 4*s*
— Green, per doz. bches., 2*s* to 3*s*
— Spanish, per dozen, 1*s* to 3*s*
Asparagus, per 100, large, 10*s* to 16*s*
— Second or Middling, 6*s*
— Sprue, or Small, 5*s*
— Natural, 12*s* to 20*s*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, per score, 6*d* to 1*s*
— Cos, per half sieve, 1*s* to 2*s* 6*d*
Endive, per score, 1*s* 6*d* to 4*s*
Celery, per bundle (12 to 15) 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 4*d*
Watercress, p. dz. small bunch. 6*d* to 8*d*
Parsley, per half sieve, 1*s* 6*d* to 2*s* 6*d*
Tarragon, per dozen bunches, 3*s* to 4*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s* to 3*s*
Sage, per doz. bunches, 3*s*
Mint, per dozen bunches, 2*s* to 4*s*
Basil, per bunch, 1*s* 6*d*
Rhubarb Stalks, doz. bundles, 6*s* to 15*s*
Mushrooms, per pottle, 1*s* 6*d* to 2*s* 6*d*

Notices to Correspondents.

α β γ.—Amongst the best dwarf varieties of Verbenas for planting out are—Verbena Sabini, lilac; V. pulchella alba, white; and V. melindres major, bright scarlet. Among the taller sorts, V. Charlwoodi, red, with dark centre; V. Buisti, pink; and V. Iveryana, with sweet-scented flowers. Fuchsia splendens may be obtained at the Horticultural Society's Garden, through the Fellows. There is a Fúchsia of the habit of microphylla, called F. Wormaldi. You may add to those you already possess, Fúchsia Groomii, stylosa conspícua, globosa major, and Riccartoni. The best mixture for striking Calceolárias is half turfy loam and half peat and silver-sand. The reason why Daphnes are such uncertain bloomers is, that they are generally potted in too rich a soil. We would advise you to reduce the ball of your Daphne indica, and repot it in a mixture of pure turfy loam, peat, and road-sand; afterwards giving it the ordinary treatment of greenhouse plants.

B. S.—The sweet-scented climbers best adapted for an eastern aspect are—Clematis flámmula, Caprifólium gratum, and Jasminum officinale. Nitrate of Soda may be procured under that name of any drysalter or dealer in manures.

John Hardy.—Geranium cuttings taken off now, and planted in the open ground, will not succeed; neither will the old plants, unless carefully protected, owing to the coldness of the earth, and the danger of spring frosts. We would not advise you to plant them out for a month to come. If you want to have your cuttings flower in the autumn, you must strike them in a hotbed.

Devonshire.—It will be impossible for you to obtain such a crop of Potatoes as you mention (450 bushels per acre) and have them ready for digging by June. The latter end of August will be much more probable.

H. K. M.—Want of light is, no doubt, the principal reason why your Came'llias do not blossom. Your Ne'rium splendens, which for the last two years has been covered with flower-buds, only requires more heat to make them expand. Siphoca'mpylus bi'color is not sufficiently hardy to stand out the winter in Perthshire. The plant you sent was Cochleária ánglica.

M. N. and *A. B.* will find in this week's *Chronicle* an article upon the destruction of Ants by sulphur.

Troublesome.—The leaves of your Pelargóniums have, no doubt, become spotted from syringing your plants, and then giving air immediately after. You will, however, find a full answer to your question in the Notices to Correspondents of last week. There is no book on drawing and colouring flowers that we can recommend.

A Cockney.—Lime-water will destroy worms, without hurting your plants. To make it, put a quantity of lime into water, stir it a few times, and let it settle; then use the clear liquid. Tobacco-water will be better to syringe your trees with, diluting every gallon of tobacco-water with an equal quantity of pure water.

J. W.—The price of common Garden Thermometers is 5*s.*

H. H.—Your account of Cucumbers growing upon the tendrils of your plants is very curious, and we should much like to see one. A list of the best Pansies will appear next week.

Cave.—Salt water will not injure your newly-planted Asparagus. In an answer to "W. D." amongst the Notices to Correspondents of last week, you will find all the information you require.

Piero.—Any of the following Trees, Shrubs, and Plants will suit your chalky soil:—The varieties of Ulmus, Fráxinus, Cratægus, Amelánchier, Acer, and Pinus pumílio; Spiræ'as, Viburnums, Ribes, Bérberis, and Phillyreas; Pæonias, Delphíniums, Lupines, Potentíllas, Œnotheras, Aconites, Campánulas, Phloxes, and Verónicas.

An Amateur.—The best remedy you can try for removing the Lichen and Moss from your Apple-trees is a mixture of soap-suds, quicklime, wood-ashes, and cow-dung; washing your trees over in winter with it, after having first scraped the roughest lichens from them.

Mancuniensis.—In watering Plants you must be wholly guided by your own judgment; we can lay down no rules for doing it, as different tribes of plants require different treatment. Watering over-head at this season of the year is beneficial to most kinds, while at the approach of winter it would be extremely injurious, and in most cases cause the entire destruction of the plant. Most of the greenhouse kinds will now be benefited by sprinkling over-head on mild evenings, when the house is closed; but this must not be done over those which are in flower.

A. B.—The cause of your Gesnera Suttoni turning yellow is owing to the bottom of the pot being choked up, and not allowing the superfluous water to drain away. The compost in which you have grown it is quite suitable. Remove all wet soil from the bottom, and repot it into a larger size, taking care to drain the pot well.

W. H.—The Foxglove, or Hellebore Powder, will be washed from the Gooseberry-trees long before the berries are fit to gather.

X. X. X.—The dryness of your sitting-room is most probably the cause of your cut Roses flagging when taken from the conservatory into the drawing-room. Cýtisus nubígenus may be easily propagated from cuttings, or by working it upon the stem of another variety. The Roses planted in the border of the Conservatory of the Horticultural Society's Garden are doing well. You may sow the seed of the Honeysuckle now—the sooner the better.

E. H. W.—It will be better not to cover the roots of your Roses and Coniferæ with turf for a few years; when they have fairly established themselves it will not signify. The Bath Scarlet and Ingram's Floribundum are very good Geraniums of their kind. A list of the best Pansies is preparing, and will appear next week.

A Constant Reader.—The Maggots which you have observed in countless numbers in your flower-garden since the middle of March, lying just below the surface of the turf, which they have eaten into like a honeycomb, and which also fill the flower-beds, collecting indiscriminately round the roots of every plant, and eating off the young shoots as soon as they appear, are the larvæ of the Crane-fly, called Tipula oleracea, described and figured in No. 38, p. 612, of the *Gardeners' Chronicle.*

H. M. says, "Having through a friend purchased a bag of Clarke's Aimatic Compost and another of his prepared Hair Dust, advertised in your columns, but which I received without any directions for using them, I applied to the vendor for the requisite information, but he has not sent me a reply. Will you, or some of your correspondents, inform me as to the best mode of their application?"—Purchasers should not buy these substances without proper directions. We know nothing of their effects, or the manner of applying them. The Aimatic compost is, we presume, from its name, some preparation of blood.

Fiorin's specimen seems to be Couch Grass, rather than Agrostis stolonifera. If he will look to some of our late Numbers, he will see by what symptoms he is to judge of the quantity of Acid required in fixing ammonia.

H. T. T. and *W. D.*—We recommend diluted Sulphuric Acid, in preference to gypsum, to be added to the contents of a reservoir in a very offensive state, because the fluid matter could be conveyed to such a receptacle without poisoning the neighbourhood to open it, which would have been necessary if an earth like gypsum had been applied. If to such a receptacle the acid is added till the smell ceases, the contents will be fit for use in a few hours.

A. H.—Gas-tar is a considerable part of Daniell's manure. We have not ourselves witnessed its effects; in his preparation it is mixed with sawdust, &c. (See p. 171.) It will doubtless be better to apply your Gas-water as soon as the weather becomes mild and rain falls; if, however, you would add to it as much weak vitriol as will prevent its smelling, you may apply it as soon as you please. You will find that it will not require much.

Titty.—Gypsum is an earth, composed of lime and sulphuric acid, and found naturally in masses in this country. When burnt it is plaster-of-Paris. It is best obtained from the makers of the latter substance.

W. D.—We consider the application of liquid manure to be injurious to Vine-borders, causing them to become clung and retentive of moisture.

R. N.—Your Pear is, to appearance, a fine specimen of the Old Colmar; but its substance is crude, and it must have been produced in an unfavourable situation.

J. Hill.—The tan, if well managed, will do very well for heating your Cucumber-bed.

C. G.'s plants are,—1, Aspídium filix mas; 2, Asplenium marinum; 3, Aspídium spinulosum; 4, Juncus bufónius; 5, Vícia sativa; 6, Saxifraga tridactýlites; 7, Acácia pulchella; 8, Cássia speciosa; 9, Pimelea hypericina; 11, Hypéricum Coris; 12, E'rica cúbica minor.

F. M. G.—We cannot undertake the distribution of the seeds which you have received from Ceylon; most of them are of little value.

H. B. R.—Your Apple is the Brabant Bellefleur.

Erica.—Your plants are,—1, Erica ventricosa stellata; 3, Erica ciliaris; 4, Hermannia sp.; 5, Polemónium cærúleum; 6, Dracocéphalum Ruyschianum; 7, Thlaspi arvense; 8, Mentha hirsuta; 9, Asplenium trichómanes; 10, Myoporum tuberculatum; 11, Narthécium ossifragum; 12, Polýtrichum alcides. Lindley's "Elements of Botany" is a book well adapted for young beginners.

W. B.—Your Apple appears to be the Lemon Pippin.

A. B.—The specimen which you sent was Cornus máscula.

J. T.—By keeping the corners of your Mushroom-beds dry the Woodlice will be attracted to them, and you may then destroy them by immersing them in boiling-water. At p. 165 of the *Gardeners' Chronicle* for last year you will find another plan recommended.

Ανθοφιλος.—Ants are undoubtedly injurious to plants; a very good plan for driving them away is published in this Number of the *Chronicle.*

W. B.—We know nothing about the new Fertiliser you mention.

Tulip.—Your Mimuluses are neither superior to, nor distinct from, the varieties cultivated about London; still Nos. 1 and 3 are very good, and worthy of cultivation.

Dahlia.—We would by no means recommend you to prune your Dáhlias in the form of standard Roses; they will look much better if you let them assume their natural shape. Your Tropæ'olum requires more heat to make it vegetate. The plant you sent is no Hibiscus, but Rubus spectábilis, and is perfectly hardy.

J. Kemp.—Your plant is Chrysosplénium oppositifólium.

The beetles transmitted by *Mr. G. J. Twiss* are the Curculio (Otiorhynchus) tenebricosus, and are nearly related to two other Weevils, whose histories were given last year in this Journal (vide No. 19, p. 292.) Sprinkling salt along the base of the wall and pretty thickly round the stems of the trees, would most probably destroy the larvæ and pupæ, but not the beetles.—*R.*

J. W.'s insect is the larva of a beetle called Helops cæruleus, which usually lives in rotten wood; we never heard of its feeding upon the corks in bottles.—*R.*

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

Our foreign news is not of great importance; in France public attention continues to be engaged by the proceedings of the Chambers, which are almost exclusively directed to questions of domestic interest. The chief topic of discussion during the past week has been the Report of the Commission to which the Railroad Bill had been referred for examination; this Report, which runs to considerable length, is regarded as highly important to the provincial interests; it recognises the principle that a series of railroads should be established by the State, and provides for the construction of eight great lines, crossing France in different directions, and connecting the capital with the principal towns in the interior and with various points along her immense frontier.—From Spain we learn that the Ministry has consented, at the request of the Cortes, to present a bill relative to cotton manufactures; the journals of all parties express satisfaction at this decision, and consider that from the general unpopularity of the measure, no treaty of commerce with this country can now be concluded.—In Portugal the recent coalition for the purpose of defeating the Ministerial candidates at the approaching elections is likely to prove a failure. The Duke of Palmella is expected shortly to join the Ministry, and the opposition is said to be gradually diminishing by the secession of its important members in favour of the Government. The commercial treaty with England is proceeding satisfactorily, and only a few points of detail remained to be disposed of. The accounts from Oporto represent the wine-trade as becoming daily more depressed; several failures have occurred, and the mercantile classes are suffering extreme embarrassment.—Our news from the Levant announces that the Porte has given the required explanations to the Greek Government relative to the late enrolment of troops in the Turkish provinces, and has disavowed all hostile intentions against Greece. Syria continues to be seriously disturbed: the British Government has protested against the appointment of the Austrian renegade, Omar Pacha, to the government of the Lebanon, and his recall is considered certain.—By the arrival of the Columbia steamer we have intelligence from New York to a recent date; the President had sent a message to Congress, recommending the repeal of a law for dividing among the States the proceeds of the sales of public lands, but the proposition was negatived in both Houses by decisive majorities. The affair of the Creole slaver continues to engage the attention of political parties. Lord Ashburton has arrived at New York; and Mr. Clay has delivered a powerful speech in the Senate on the relations with England, in which he expressed his hope that the American people would hail the arrival of his Lordship as a messenger of peace; and declared his conviction that all the existing difficulties would be amicably settled.

At home, the proceedings in both Houses of Parliament have been more than usually important, and the questions disposed of have, with scarcely an exception, been interesting to all classes. In the Lords, the new Corn Bill was read last night for the third time. Numerous amendments had been moved by different Peers, having for their object the total repeal of the duty, the adoption of a fixed duty, or the absolute rejection of the measure; but they were all negatived by large majorities, and the Bill has consequently passed through its several stages without alteration. In the Commons, the Income-tax Bill was read a first time on Monday, after an interesting discussion on the principle of the measure, during which Lord J. Russell proposed as an amendment, that the Bill be read a first time that day six months; on a division, this amendment was negatived by a majority of 97, and the Bill was read a second time last night. An animated debate has occurred on a motion for a select committee to inquire into several alleged frauds in different branches of manufactures; but at the suggestion of Ministers the motion was withdrawn, and an amendment for an inquiry into the truck system was agreed to. The Copyright Bill has passed through committee, with a few verbal amendments; and a motion for a select committee to inquire into the five points of the "People's Charter," embracing universal suffrage, vote by ballot, and annual parliaments, has been negatived by a majority of 159, in a House of 293 Members.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen honoured the Italian Opera with her presence on Saturday and Monday, and the Haymarket Theatre on Tuesday evening. On Wednesday her Majesty honoured the Concert of Ancient Music at the Hanover-square rooms with her presence, H. R. H. Prince Albert being the director for the evening. The Queen and Prince Albert, with the usual royal suite, left Buckingham Palace yesterday morning for Claremont, where the court will remain until Monday, and then return to town. It is said to be definitively arranged that her Majesty's next ball, which is to take place, according to present arrangements, on the 12th May, is to be a fancy dress ball; and that the Queen and Prince Albert have signified their intention to honour with their presence a ball for the benefit of the Spitalfields silk-trade, at the Italian Opera-House on the 26th May.

Official Appointments.—The Gazette of Tuesday announces the appointment of Prince Albert as Lord Warden of the Stannaries and Chief Steward of the Duchy in the counties of Cornwall and Devon. The salary and emoluments hitherto attached to this office have been abolished by his Royal Highness's desire.—The Duke of Sussex has been appointed by her Majesty to be the Governor of Windsor Castle, vacant by the death of the Earl of Munster.—It is stated that her Majesty has directed the restoration to the army of Capt. Richard Anthony Reynolds, late of the 11th Hussars, and that he will be gazetted in a few days as a captain of the 9th Lancers, now under orders for India.—At a Court of East India Directors, held on Wednesday, the Marquis of Tweeddale, the new Governor of the Presidency of Madras, was also appointed Commander-in-Chief of the Company's forces on that establishment.—Accounts from the Mauritius, dated the 5th Jan., mention the death of Sir Lionel Smith, the Governor, after a short illness, on the 2d of that month. The temporary command of the island has, in consequence, devolved on Col. Stavely.

Parliamentary Movements.—Mr. Joseph Hume has been returned without opposition for the Montrose burghs, the Hon. E. J. Stanley and Mr. D. W. Jobson having both retired from the contest.—The Committee appointed to inquire into the Longford Election petition have decided that Luke White, Esq. was not duly elected to represent the county of Longford, and that Anthony Lefroy, Esq., was duly elected, and ought to have been returned. The committee also came to a special resolution that, considering the contrary decisions which had taken place in respect to the question of "opening the registry," it was absolutely necessary that the Legislature should pass some declaratory law on the subject.—The Cardigan Election Committee have declared Mr. Pryse Pryse, the sitting Member, duly elected.—The Wakefield Election Committee have decided that J. Holdsworth, Esq. was not duly elected for that borough, and that the Hon. W. S. Lascelles was duly elected, and ought to have been returned.—The election petitions from the county of Rutland and the borough of Beverley have been abandoned.

Foreign.

FRANCE.—The papers contain little intelligence of political interest. They continue to comment on Sir R. Peel's financial measures, and on the commercial relations between England and France. The "Journal des Débats" observes that "Sir Robert Peel's financial plan has with justice captivated the attention of all Europe. It is a plan conformable to the spirit which animates British statesmen. They are as ready to act as to speak. When they have probed the wound, they apply the remedy with a steady hand. The chief of the new Ministry has produced a plan which is simple and conformable to the eternal rules of good sense, reason, and experience. There is nothing better calculated than Sir Robert Peel's plan to demonstrate the immense resources of Great Britain, and the high degree which private wealth has reached. Although he leaves untaxed incomes under 150*l.* (British) a-year, he is certain to obtain a revenue of 108,000,000 francs. If such a basis were attempted to be laid down with us, there would be scarcely any income to tax. There are some of our departments in which such a tax would scarcely defray the expense of collecting it, and yet we are incontestably by far the most wealthy of the great nations of Europe: a convincing proof of the productiveness of persevering industry—for the wealth of England is entirely due to the labour of her inhabitants. It is not mines of gold or diamonds which have enriched the British nation; it is her perseverance in fructifying, by well-directed and continuous efforts, the soil of the country, and in cultivating its natural advantages."

The Chambers.—The proceedings in the Chambers continue to engage the chief portion of the attention of the journals. The Chamber of Deputies have reformed the 114th article of the Code of Criminal Instruction, relative to individual liberty. The code before gave the judge the power of setting an accused at liberty, on bail, when the penalty incurred by him was only of a correctional nature; but the new article, substituted in its stead, makes it imperative for him to do so.—An official account has been published of the revenue for the first quarter of the present year as compared with the corresponding quarter of the last year, which shows an increase on the quarter ending the 1st inst. of 13,088,000 francs.

Railroads.—In the Chamber of Deputies, on Saturday, M. Dufaure, the Chairman of the Committee to which the Railroad Bill had been referred for re-examination, read the report of the Committee. It extended to great length, but the following is its substance:—It provides that the State shall establish lines of railroad—1. From Paris to the Belgian frontier, by Amiens, Arras, Lille, and Valenciennes. 2. From Paris to a point of the Channel not yet determined. 3. To the German frontier, by Strasburg. 4. To the Mediterranean by Lyons, Avignon, Tarascon, and Marseilles. 5. To the Spanish frontier, by Bordeaux and Bayonne. 6. To the Ocean, by Tours and Nantes. 7. To the centre of France, by Orleans, Vierzon, and Clermont. 8. A line from the Rhine to the Mediterranean, by Mulhausen, Dijon, Chalons, and Lyons. The Commission adopts the clauses of the bill relative to the manner in which the sums necessary for the execution of the project are to be raised. The State is to furnish part, the localities part, and the rest is to be raised from private shares. It accords immediate credits for the execution of—1, the Paris and Belgian line; 2, the line from Paris to the German frontier; 3, for the section from Chalons to Dijon on to the two lines of Paris to the Mediterranean, and the Mediterranean to the Rhine; 4, for the line from Avignon to Marseilles by Tarascon; 5, for the section from Orleans to Tours, common to the two lines of Paris to the frontiers of Spain, and Paris to the western frontier; 6, for the section from Orleans to Vierzon, belonging to the line from Paris to the centre of France. The general discussion on the bill is fixed for the 25th inst. The Rouen Rail Bill has passed the Chamber of Peers by 99 against 6.

The Capital.—The journals inform us that the Duke D'Aumale and the Prince De Joinville will shortly leave Paris on a visit to Queen Victoria, and that they will make a general tour to visit the public establishments in this country; but the report appears to require confirmation.—It is reported in Paris that an amnesty in favour of political offenders will be granted on the occasion of the King's fête on the 1st May, and that Prince Louis Napoleon will be comprised among the amnestied. The Countess Demidoff, his cousin, and the Leuchtenberg branch of his family, have lately exerted themselves to obtain his liberation from captivity, but Ministers had as yet come to no resolution on the subject, and would, it was thought, postpone publishing any act of the kind until the approach of the elections.

The Fleet.—Private letters from Toulon, dated the 12th inst., state that all the vessels in commission in that port were taking three months' provisions on board for a cruise to exercise the men, but where the evolutions were to take place is not mentioned.

Boulogne.—The process instituted by the French Post-office authorities against the courier employed by the London Morning Papers to convey the East India and Chinese intelligence brought by the overland mails through France, and which we noticed at length in our last, has terminated in a judgment against the defendant, who has been sentenced to pay a fine of 150 francs and the costs. Two English ladies, who had conveyed letters in complaisance to their friends, were also condemned and subjected to the same sentence.

Algeria.—The "Journal des Débats" states that the Committee on the Budget has received an important communication from the President of the Council of Ministers, apprising them that the Cabinet has unanimously adopted M. Poirel's plan for the improvement of the port of Algiers, as the one which will require the least time and expenditure. The "Debats" adds, that orders have already been forwarded to Algiers to commence the execution of the works. It appears that M. Poirel's plan consists in extending the old mole of Algiers, so as to create a secure anchorage for 25 sail of the line, and 300 merchantmen.—Accounts have been received from Algiers to the 10th inst. A strong shock of an earthquake had been experienced there on the 9th inst., but no damage had been done. There were various rumours in Algiers that Abd-el-Kader and one of his chief officers had been taken prisoners, but they were not believed in well-informed quarters. General Bugeaud was expected to have left Cherchell on the 9th inst., but no news had been received of his expedition. An aide-de-camp of the Minister of War, Commandant Foltz, has just left Paris for Algiers, on a mission from the Government.—The "Moniteur" has since published additional despatches, received by the Minister of War, from the Governor-General in Africa, and Gens. Bedeau and Lamoricière. Abd-el-Kader was expected to have crossed the Tafna. He was watched by Gen. Bedeau's division at Tlemcen on the 2d inst. The French General states, in his despatch, that the Emperor of Morocco had forbidden all intervention in favour of the Emir. Gen. Bugeaud's despatch relative to his march to Cherchell is dated the 8th inst., and he claims in it great advantages by the destruction of various tribes and villages, at the cost of 7 killed and 33 wounded. The rain had prevented his further operations. He announces, in a second despatch of the 9th inst., the submission of certain tribes.

SPAIN.—A telegraphic despatch from Madrid, dated the 13th inst., states that some disturbances had broken out in that capital in consequence of a coalition of the operatives, arising from the want of work and dearness of bread. Some persons had been severely wounded; but on the morning of the 13th tranquillity had been restored. The Chamber of Deputies was occupied, on the 8th inst., with a discussion on the proposition for requesting Government, in the name of the Cortes, to present a bill relative to cotton manufactures, as promised by the Tariff Bill of last year. Several of the Deputies spoke on the occasion, but the discussion was not animated, as the Ministry made no opposition to the proposition, and declared that it was anxious to comply with the promise of last session, and had delayed the presentation of a bill merely from a desire to frame it in such a way as to conciliate all interests. The proposition was accordingly adopted. The papers of all parties express much satisfaction at this decision of the Chamber, and seem to consider it as certain, from the general unpopularity of the measure, that no treaty of commerce can now be concluded. It appears that the Catalonian deputies were not alone opposed to the project, but that they were supported by the members for Andalusia, Castile, Valencia, and Arragon. Although, however, all idea of a commercial treaty seems to be out of the question, it is thought that some modifications may yet be introduced into the tariff. The committee to which the extraordinary demand of a credit of 160,000,000 reals had been referred, has acceded to the grant. The journals mention that the Infant Don Francisco de Paula and his family were expected to arrive in Madrid on the 14th inst., on their way to Andalusia. The Government, they add, has decided that those Princes, so amicably disposed towards the Constitutional cause, shall be received with all the honours due to their rank; and the road along which they are to pass is already lined with the troops necessary to supply them with escorts.—The Queen and Court were expected to leave Madrid on the 15th inst. for Aranjuez, where, it is said, they will reside till June. Many families were preparing to go to the same place. There were some rumours in Madrid that the Cabinet had addressed to the French Minister for Foreign Affairs a note protesting against the pastoral letter of the Archbishop of Paris to the French clergy, in obedience to the Pope's message to put up prayers for the Church of Spain. The report, noticed in a former Number, that the Queen had refused the insignia of his office, as Chamberlain, to Commandant Dolce of the Halberdiers, appointed to that office by her guardian, M. Arguelles, has been officially contradicted. The celebrated banker and loan contractor, Señor Aguado, has died at Oviedo, from an attack of apoplexy. The journals publish accounts received from the Philippine Islands, under date 15th Jan., announcing that the military authorities had adopted the most severe measures to repress a revolt which had taken place at Tabayas, and that 1,400 persons had already been executed by order of Captain-General Oraa.

PORTUGAL.—By the Montrose steamer we have received intelligence from Lisbon to the 11th inst. Notwithstanding the efforts made by the coalition, noticed in our last, as formed with a view to defeat the Ministerial candidates at the coming elections, it is said they are likely to prove favourable to Government; and that letters have even been forwarded to the Home Secretary from all parts of the country, promising him support. Ministers, it is added, reckon upon the entire Opposition in the next Cortes not amounting, upon important questions, to more than 12 votes in a Chamber consisting of 145 members. It is announced that the Duke of Palmella will most probably join the Ministry as Foreign Secretary. A Council of Ministers has been held, at which it is said to have been resolved that the offer should be made to his Grace on the 11th inst., the day the mail left; and it was thought that the Duke would give his assent. MM. Silva Carvalho and Rodrigo Magalhaes, from whose opposition some fears appear to have been entertained, had likewise indirectly given their adhesion. A list of 23 new peers had been drawn up, and was to be submitted for the Queen's approval at the Council of State, to be held on the 16th inst. Senhor Costa Cabral was said to be endeavouring to conciliate the Miguelites by including a few of their number in the list. The organisation of the new National Guard was expected to be complete in 2 months' time. Private letters state that the commercial treaty with England will be concluded and signed within a month. The Duke of Palmella is said to have acquainted the Government, that upon the general principles of the treaty he was quite agreed with Lord Howard, and that there were only a few points of detail upon which his mind was not yet made up. These, it was expected, would soon be disposed of, with the assistance of Baron Tojal and commercial referees. The ceremonial of the young Prince's baptism was to take place on the 17th inst., the Pope, represented by Monsignor Cappacini, being one sponsor, and the Princess Amelia, ex-Regent of Portugal, the other. The French squadron was about to leave Lisbon immediately, a war-steamer having arrived from Brest with orders to that effect. The destination of the squadron was not known, but it was supposed to be Tangier. The accounts from Oporto were becoming daily worse, and the wine-trade was seriously depressed. Several failures had occurred, for a considerable amount, and fresh ones were said to be expected daily. The commercial community in that city had expressed themselves pleased with such portions of the alterations in the tariff proposed by Sir R. Peel as affected their trade with England.

GERMANY.—The Journals, which contain little intelligence of political interest, announce, that an arrangement has been concluded between the Austrian Government and the other German States to facilitate the projected reform in the Post-office Department noticed in our last. Vienna letters of the 10th inst. announce the arrival in that capital of M. Pageot, late French Chargé d'Affaires in Madrid, charged with a special mission to announce to the Austrian Cabinet, on the part of the French Government, that France would not permit any marriage of Queen Isabella of Spain, except with a member of the House of

Bourbon. M. Pageot, on the 9th inst., dined with Count Flahaut, the French Ambassador, in company with Sir R. Gordon and Prince Paul Esterhazy. The latter, it is added, was to proceed shortly to England on an extraordinary mission.—Accounts from Berlin, dated the 9th inst., state that the Count of Nassau (the Ex-King of of Holland) was attacked with so serious an inflammation of the lungs on the night of the 8th inst. that his life was despaired of. The last bulletins, however, state that his breathing has been relieved, and that he is gradually getting better. The Prussian Government being unwilling, it is said, that its relations with Russia should be disturbed by any remarks in the newspapers, has just issued an order to the censorship to forbid all articles against the prohibitive system of Russia or the treaties between Prussia and Russia respecting the giving up of deserters. Accounts, dated the 12th inst., state that the important question respecting the system to be introduced into the Prussian prison discipline has been decided. The Pennsylvanian system, defended by Dr. Juliens, has been rejected, and the system hitherto adopted by Government will, on the whole, be retained. In the construction of the penal institutions, however, orders have been given for various alterations, which the King has judged advisable since his late inspection of the London prisons, especially the model prison; and several prisons are accordingly to be forthwith built or altered, especially at Berlin, Königsberg, and Munster. The new Minister of Finance, Baron Bodelschedringh, will enter on his office on the 27th inst. The same accounts inform us, that the choice of a successor to Baron Bulow, as Prussian representative in the German Diet, is not yet determined on; but private letters state that Gen. Geetten is spoken of. Berlin letters of the 10th inst. state that previously to the King's visit to London, the Council of State resolved upon the formation of a railroad from Berlin to the Rhine, and an officer of the Minister of War was ordered to prepare a plan for a military railroad; but on its being presented to the King, on his return, he rejected it, declaring that he would have no railways that should not be alike beneficial to the whole of Germany.

Belgium.—Accounts from Brussels state that the "Moniteur," official organ, has published the five following conventions:—" 1. Convention of navigation between Belgium and Austria. 2. Conventions between Belgium and Hanover. 3, 4, and 5. Convention between Belgium on the one part, and Hanover, Anhalt, Bamberg, and Saxony on the other, to secure to the subjects of the contracting parties the power of inheriting and acquiring property on the same conditions as the native subjects of the respective countries."

Switzerland.—Intelligence has been received, that the Constituent Assembly of Geneva adopted, on the 10th inst., the article of the new Constitution which fixed the number of deputies for the canton at 176.—Accounts from Berne state that the Government has just received an official communication from the cabinet of Wurtemberg, declaring that all the subjects of this latter State residing in Switzerland will lose their civil and political rights unless they obtain permission from the Government of Wurtemberg to reside there.

Italy.—We learn from Rome, that the murderer of Count Pahlen, the circumstances attending whose death were noticed in a former Number, has been tried and condemned to death. He was a dealer in antiquities, of whom the Count was in the habit of making purchases. Letters from the same city, of the 4th inst., state that a public functionary from Chili, who is now in that capital, has induced two hundred Spanish refugee priests to proceed to Chili and Buenos Ayres, where there is a great scarcity of priests, in consequence of the war.—Private letters from Naples state that an important discovery of coal has been made in Calabria, which will greatly facilitate steam-navigation in the Mediterranean.—The nuptials of the Prince Royal of Sardinia with the Archduchess Maria Adelaide of Austria were celebrated on the 12th inst. in the chapel of the chateau of Stupinitz, near Turin, in presence of the Royal family of Sardinia, and of the Viceroy and Vice-Queen of the Lombardo-Venetian kingdom. The young Archduchess left Milan on the 10th inst., and arrived on the following evening at the chateau of Stupinitz, to which the Royal family repaired on the morning of the 12th, accompanied by the entire Court. After the ceremony, the Royal party make its entry into Turin. On reaching the public square, the bride and bridegroom were addressed by the Governor of the city, and the first Syndic; after which, twelve young girls, attired in white, presented the bride with baskets of flowers and fruits. In the evening there was a banquet at Court, and the capital was illuminated. The festivities, ordered by the King in celebration of the event, were to last a fortnight. The Journals also inform us that the King, on this occasion, has granted entire pardon to all his subjects condemned for political offences. The ordonnance announces, that they will be restored to the enjoyment of their civil rights, and that their confiscated property shall be restored to them with the arrears which are in the hands of the Administration. We learn from the Papers, that the eminent engineer, Mr. Brunel, has left England on a visit to the King of Sardinia, and that the object of the journey is for the purpose of ascertaining the natural facilities for the construction of railroads throughout that kingdom.

Russia.—The Paris Journals devote much space to comments on the following intelligence, said to have been received from St. Petersburg, from an authentic source. It is stated that "The Russian Government have notified confidentially to the Cabinet at Washington that they had used their utmost endeavours to prevent the adjournment of the ratification of the treaty on the right of search by France from causing any change in the political relations between the five Powers, and apprising them that the Emperor recommended the United States not to depend upon this adjournment in their political arrangement with respect to Great Britain." The Journals referred to state that "This communication is significant; and that when divested of its diplomatic form, it means that the great Powers expect the pure and simple ratification of the treaty signed on the 12th Dec. 1841, and that M. Guizot has engaged to do so; that the Emperor warns the American Government not to carry their resistance to the right of search too far, and gives the United States to understand, that should they do so, they could not expect any assistance from Europe, France having promised to join the coalesced Powers."

Ionian Islands.—An ordinance has been issued by his Excellency the Lord High Commissioner, dated Corfu, March 18, announcing—in accordance with his speech to the Ionian Parliament on the 3d of that month, as reported in our 14th Number—that the Ionian trade in corn, which has hitherto been treated as a monopoly by the Government of those islands, will, after the 1st June, be entirely free.

Greece.—Private letters from Athens, of the 27th ult., state that the explanations given by the Porte to the Greek Government relative to the late enrolment of troops in the Turkish provinces are of a satisfactory nature; that the Porte disavows all hostile intention against Greece, and declares formally that tho troops were raised solely with a view to Syria.

Turkey.—We have received intelligence from Constantinople to the 27th March. Admiral Walker had addressed, on the 18th ult., a letter to the Grand Vizier, returning the sword presented to him by the Sultan, as being of inferior value to those presented to other officers. —Syria continues in a seriously disturbed state; and a body of Albanians has been despatched there by the Porte to put down the malcontents. It will, however, be seen from the speech of Sir R. Peel, under our Parliamentary intelligence, that the Porte has given satisfactory explanations respecting the object of these troops; and that none of them are intended to proceed to the Lebanon. It will also be seen, from the same source, that the British Cabinet has seriously remonstrated against the appointment of Omar Pacha; and that there is a probability of his being superseded in the government of the Lebanon.—Private letters from Constantinople, dated the 24th ult., state that the Shah of Persia has, in consequence of differences with the Porte, recalled his Ambassador, and appointed a Consul-General, who is a Christian, of Georgia, and a Russian subject, and who will receive his instructions from the Russian embassy at Constantinople. Prince Mavrocordato, the Greek Ambassador, had his private audience of the Sultan on the 28th ult.

China.—We understand that an officer, who has recently arrived from Bombay, brings the report that the British troops were advancing on Pekin; and that the Emperor had quitted the city, with all his treasure, for some town in Tartary, beyond the reach of danger.

West Indies and South America.—By the arrival of the Royal Mail steamer Forth, which reached Falmouth on Wednesday night, we have received intelligence from these colonies to a recent date. The authorities at the Havannah appear to be apprehensive of some outbreak or attack, great vigilance being kept up to prevent surprise, and to bring the troops into a high state of discipline. Vigorous measures have been adopted against the slave-trade; and it has been ordered that any estate upon which newly-imported negroes may be found shall be confiscated. Suits have already been commenced against the owners of two or three who have broken the decree. The accounts from Havannah bring disastrous news of the West India mail steamers. There was a report that the Dee had gone on shore at Turk's Island, and that she would be a total wreck; but it appears to be unfounded. The Tweed left Portobello on the 8th ultimo, for Kingston; and on the 12th, having encountered strong north-east gales, she exhausted her fuel, and was obliged to put back to Porto Bello, where she arrived on the 24th. She was to sail again on the 27th for Kingston. Lord Morpeth had arrived at Havannah.—The accounts from Mexico are important. The Mexicans, with a strong force, which varies, according to different accounts, from 8,000 to 14,000, had invaded Texas. They had occupied, at the first irruption, San Antonio and Goliad. The Texans, who mustered about 4,000, were concentrating on Victoria, Gonzales, and Austin, at which place determined resistance was expected to be made. Strong reinforcements of "Sympathisers" were expected from the United States, whose Government had ordered a small squadron into the Gulf of Mexico to protect American interests.—We have intelligence from Buenos Ayres, which is of a more detailed character than the accounts last received. Governor Rosas had, in the name of the Executive Government, sent the annual message to the Legislative Assembly, which was strongly worded, against the junction of Corrientes with Monte Video, rejecting the proffered mediation of England and France to arrange the dispute, and expressing a determination to subdue those refractory provinces. The budget had also been presented, and showed a deficiency of nearly fourteen millions of dollars in the revenue of the year 1842. Governor Rosas, without proposing any plan for arranging this, had tendered his resignation; but it was generally supposed that it was merely a *ruse*, and that he would be solicited to retain the Presidency. The Buenos Ayrean and Monte Videan squadrons had had another engagement; but, like the former ones, nothing decisive had been done, each party, it is stated, running away from the other. It has been determined that the establishments of the Jesuits shall be broken up; and an intimation of the fact has been sent to the Pope—the message representing that "public opinion was driving them out of the country."

United States.—By the arrival at Liverpool on Wednesday of the royal mail steamer Columbia, we have received New York Papers to the 1st inst. The Columbia left Liverpool on her outward-bound voyage on the 4th ult. Shortly after the commencement of the voyage, she encountered a series of heavy gales, which she weathered without having sustained any damage, until the 18th, when, in lat. 44. 33, long. 50. 4, at seven in the evening, the intermediate shaft broke, and the engine stopped. The floats were immediately stripped off her wheels, and the remainder of the passage was made under canvas, the whole voyage from Liverpool to Halifax having occupied 20 days 15 hours. The mails and the passengers for Boston were taken forward by the Unicorn steamer. Meanwhile, the Columbia, it being impossible to repair her machinery at Halifax, was equipped for performing the voyage to Liverpool under sail. The Unicorn having brought the American mails of the 2d inst. from Boston, they were transhipped on board the Columbia, which sailed on the evening of the 4th inst., and. notwithstanding the easterly gales, made the voyage to Liverpool under 17 days, with scarcely any assistance from her only workable engine. The intelligence brought by this conveyance is of some importance. The President had transmitted a message to Congress recommending a repeal, or suspension tantamount to a repeal, of the law passed at the extra session, for dividing among the States the proceeds of the sales of public lands, on the ground that the lands would constitute a specific and valuable pledge for the loans required by Government. The message had been taken into consideration by both Houses, which, by decisive votes, had determined that the Distribution Bill should not be repealed. A strange proceeding had taken place in the House of Representatives. Mr. Giddings, the representative of the State of Ohio, offered a series of resolutions referring to the capture of the Creole, of which the following are the most important:—" That when the brig Creole, on her late passage for New Orleans, left the territorial jurisdiction of Virginia, the slave laws of that State ceased to have jurisdiction over the persons on board the said brig, and such persons became amenable only to the laws of the United States. That the persons on board said ship, in resuming their natural rights of personal liberty, violated no law of the United States, incurred no legal penalty, and are justly liable to no punishment. That all attempts to regain possession of, or to reenslave said persons, are unauthorised by the constitution or laws of the United States, and are incompatible with our national honour. That all attempts to exert our national influence in favour of the coastwise slave-trade, or to place this nation in the attitude of maintaining a 'commerce in human beings,' are subversive of the rights and injurious to the feelings and the interests of the free states, are unauthorised by the constitution, and prejudicial to our national character." At the request of several members, however, he withdrew his resolutions, and a motion censuring Mr. Giddings was then brought forward, and adopted by the House without allowing Mr. Giddings to speak in his defence. Mr. Giddings sent a note to the Chair signifying his intention of resigning his seat, and left the House. In the Senate, Mr. Clay, in the course of a speech, incidentally referred to the relations of the United States with Great Britain. The following is an outline of the part interesting to the English public. Mr. Clay has not, it will be seen, any apprehension of war springing out of the differences between the two countries:—" He regretted," he said, "to see the assaults made by the partisan press on the distinguished individual who had been sent to them with the olive-branch of peace. Nothing was so unmanly or so indecent as those attacks. He had the good fortune, when in England, to know Lord Ashburton, and he bore the highest character in his own country, both for wisdom and integrity. However the hospitalities of the land might be violated by a licentious press, he hoped that the American people would greet the arrival of this gentleman as a messenger of peace. There is no danger, continued Mr. Clay, of any rupture with Great Britain, if proper ability is employed in the management of the controversy. The first point of controversy is the North-Eastern Boundary. The negotiation on that subject was in progress, with every prospect of a satisfactory termination. The basis of an arrangement had been agreed upon, and there only remained some minor points to be settled. There was, therefore, no apprehension of war from that source." He then alluded to the affair of the Caroline, which he regarded as settled, adding that, at all events, no war could take place on account of that affair. The Creole affair, he said, was the subject of negotiation; and he censured a little the premature publication of the instructions of the Government. Great Britain, he thought, ought to indemnify them; but there was no immediate apprehension of war from this matter. The Right of Search was the remaining question. "That right," proceeded Mr. Clay, "was one that could not be exercised without great abuses, and the United States would never yield it. Nor did he understand Great Britain as claiming it. What said Lord Aberdeen on this subject? We claim no right to examine any American vessel. Even if she be full of slaves, if she be American—if she have American papers—we will not stop her in her course. But as pirates may hoist your flag, and as other nations, Spain, Portugal, France, or England, might use it, we, who are bound by the treaty, will examine her, and if she be a false vessel, with a flag that she has no right to use, then we will take her; but if she be American, she may pass on. Mr. Stevenson himself admits, in his correspondence that the mere fact of a flag at the mast-head cannot protect a pirate. The protection must be commensurate with the genuineness of the character of the vessel. A treaty providing a mutual right of search was, some years ago, entered into between the United States and Great Britain. Mr. Canning said to Mr. Rush, Draw up your own arrangements, and we will agree to it. Mr. Rush drew up a treaty accordingly. It granted a mutual right of search in the vicinity of the West Indies and on the African coast. The treaty came to us. We ratified it; but struck out that part relating to the West Indies. The treaty went to England for ratification there, and Mr. Canning, piqued at our alteration of a treaty drawn up by us, refused to assent to it. In the existing state of this matter, it can be easily settled by an arrangement between the two Governments, if it is entered upon in a spirit of amity. He had no doubt, in fine, that all the existing difficulties could be amicably settled." The finances of the country are in a serious state. The Treasury of the nation is bankrupt, and its notes, bearing 6 per cent. interest, had been offered at a depreciation varying from 3 to 6 per cent. discount. Congress had not shown any disposition to relieve the Treasury from its difficulties. The Loan Bill, for 12,000,000 dollars, had not yet passed the House of Representatives, though it was expected to do so shortly.—The resumption of specie payments by Pennsylvania, Maryland, and West Jersey had been accomplished without difficulty or distress. Virginia and other States were expected to resume also. The Warspite, with Lord Ashburton on board, arrived at New York on the 1st inst. A great fire had taken place at New York, which had destroyed nearly 70 houses. A fire had also taken place at New Orleans, and the Theatre St. Charles had been completely destroyed.

NEW ZEALAND.—A correspondent of the "Morning Chronicle" has sent a statement to that paper in reply to some aspersions which have appeared in the City article of a contemporary against the colony of New Zealand. The statement in question describes Port Nicholson as a barren waste, the soil inapplicable to agriculture, commercial advantages, &c. This correspondent says that this is decidedly untrue, for nearly every inch of the soil, down to the very edge of the water, is covered with luxuriant vegetation, and timber in abundance near the town. During a residence of fourteen months in Port Nicholson, he has seen several descriptions of wild plants, such as turnips, celery, flax (not the Phormium tenax, but what in England is called by some persons linseed), &c., growing on the verge of the high-water mark. Trees and shrubs are evergreens; potatoes are taken from the ground for use nine months out of the twelve; peas in bloom all the year. The first crop of wheat produced nearly as fine a sample as ever was raised in Essex. During his fourteen months' residence in the colony, this writer says that he had one hail-storm, and two very frosty nights, each leaving ice not quite so thick as a sixpence. The place is well supplied with plenty of fresh water, and good coal has been found in great abundance. With respect to the natives, the writer upholds all that has been said in their favour. They are honest, which he has many times proved intentionally; exceedingly apt and intelligent; numbers of them can read and write, work for wages by the day or week; and very few are drunkards. He has oftentimes heard them compare their condition to what it was but two years previous, and that with gratitude to the "white man."

Parliament.

HOUSE OF LORDS.

Monday.—After a number of petitions upon various subjects had been presented, the Earl of RIPON moved the order of the day for the second reading of the Corn Importation Bill. The question, he said, which he had that night to bring before their Lordships, was emphatically the most important with which the Legislature could be called upon to deal. It was, in substance, the food of the people, and what was the best mode by which that essential object can be secured, and by which could be obtained for the public at large an adequate and steady supply of the first necessary of life at a reasonable and moderate rate. There were two great antagonist principles advanced by opposite parties with reference to the question. One of these principles was, that all restrictions upon the importation of foreign corn ought to be removed; and the other, that the importation of that article ought to be regulated and restricted. The great evil which would accrue from the adoption of the former principle would be, that the people of this country would then be compelled to depend for their subsistence upon the produce of other countries, not for the purpose of supplying a temporary and occasional deficiency, but as their principal means of support. The noble Lord proceeded to show that this country would not be able to derive the requisite supply, either from Europe or the United States; and he therefore thought that it would be much wiser and much safer to rely essentially on our own produce, and in order to insure its supply to give it protection: which, it was obvious, he said, could only be efficiently given by some system of duty, either fixed or fluctuating, inversely to the price of corn. It had been said that we had already had 13 years' experience of a fluctuating duty, and that it had failed. He denied that it had failed, though he admitted that the working of the principle might be improved. Since the present Corn-law had been passed, there had been an increase in the population of 2,000,000; and if there were any truth in the doctrine, that population was always pressing on the heels of subsistence, he thought it was clear that the inadequacy of our produce to meet our wants would increase in every succeeding year; and, therefore, we ought to look this necessity at once in the face. The noble Earl, after entering into the details of the Bill before the House, concluded by saying that he felt confident the measure would work beneficially for all classes of the community; that that was the sole object which those who had framed it had in view; and, if they had been guilty of endeavouring to deceive the people as to what was the object of the bill, or in anything else, they would have been guilty not only of the most miserable, base, and contemptible offence of which a Ministry could be capable, but they would also be guilty of the most inconceivable folly. The noble Lord then moved the second reading of the bill.

Earl STANHOPE opposed the bill, and made an attack on Sir Robert Peel and the Government, who, he contended, had grossly deceived the agricultural interest, which had placed them in power. He thought that any attempt to alter the existing Corn-laws would have the effect of stirring society to its foundation, and undermining its whole fabric. The proposed measure, he considered, would have the ultimate effect of annihilating rent; and although he did not believe that land would go out of cultivation, it would, he considered, be retained only for the use of those who owned, occupied, or tilled it; and thus a state of things would be brought about, which, at no distant period, would result in a national bankruptcy. The noble Earl concluded by imploring their Lordships no longer to remain a merely registering body to the acts of the other House, but to re-assert their privileges and reject the bill; and moved as an amendment, that it be read a second time that day six months.

The Earl of HARDWICKE supported the measure, and defended Sir R. Peel from the charge of having deceived his supporters. His reason for supporting the present measure was, that he considered it good and just, and because he thought that it would do no injury to the agriculturist. He added, that the farmers in his part of the country (Cambridgeshire) were generally of opinion that some such alteration as the present was unavoidable. The noble Earl concluded by saying, that Government had come into power with the full determination to act, not for party or class interests, but for the general interest of the country, and to do their best for the welfare and prosperity of the country, which, on their accession to office, they found placed in great jeopardy; and it was with this conviction that that government had been and would be supported in Parliament; and he fully believed that the loyal and honest people of this country would, under all circumstances, know how to appreciate the value of those men who, setting aside all party and class considerations, were bent upon doing that, and that alone, which they conceived would conduce to the well-being of the country at large.

The Duke of BUCKINGHAM said that a more important question could not be brought before them. He looked upon the bill with a deep feeling of alarm; he regarded it as a measure produced, no doubt, with the best of motives, but as one, in his humble judgment, calculated to do great harm to the agricultural interest. He feared also that the foreign farmer would be enabled to enter the market with undue advantages, and that the home-grower would be overpowered by competition. The bill, he thought, would not satisfy the expectations of either of those great parties into which the State appeared to be divided; and, considering it as a measure prejudicial to the farmer, and subversive of the landlords' interest, he should cordially support the amendment.

The Earl of WINCHELSEA expressed his satisfaction that a question which had excited so much discussion, and which in its agitation had produced so much evil, was now about to be brought to a final settlement. He denied that the present Government had been guilty of any deception, and was prepared to give the measure his hearty support.

Lord WESTERN charged the Conservatives with deserting their friends, the agriculturists, by whose assistance they were raised to power. He had no hesitation in saying that one of the effects of the present measure must be to reduce the price of corn. There would be a considerable diminution in the price of all agricultural produce, and upon what class would this fall? It would decidedly fall upon the labouring classes. He considered that Government, by adopting their present policy, had indulged in experiments at the expense of the agriculture of the country. He was of opinion that it was the state of our monetary system alone that had caused all the present commercial distress; and he was convinced that the country could not continue to go on with the present state of the currency; and if it was persisted in, the result must be that this mighty empire must go down.—Lord FITZGERALD defended the Government measure, and vindicated Sir R. Peel from the charge that had been brought against him—that he had abandoned his former defence of the principle of protection to agriculture. He contended that his right hon. friend was the last man in the country who would seek to deceive the people of England for the sake of political advantage either to himself or to his party, or to the principles which that party espoused.—Lord BEAUMONT opposed the measure, and expressed his alarm, not only at the present bill, but at the reductions and alterations proposed in the new tariff.

Lord BROUGHAM regretted that by the course of the debate he was reduced to this alternative—either that he must reject, or that he must adopt, the bill altogether. To neither of these opinions was he inclined to accede. He considered this bill as a change—a considerable change, and, what was better, a change in the right direction; but he regretted that it did not go further. He then explained the reasons why he preferred the proposed to the existing Corn Law. He thought that the throwing open of the corn trade would not only be the most just and expedient measure, but also the measure most safe for all parties. He preferred, however, a wholly free trade to both, and explained at considerable length the advantages he expected the country would derive from an unrestricted admission of foreign corn. The noble and learned lord concluded by moving an amendment that "no duty ought to be imposed upon the importation of foreign corn of any description."

Earl FITZWILLIAM declared his intention of voting for the second reading of the bill—not on account of its finality, but because he believed, with his noble and learned friend, that it carried in its bosom the seeds of future improvement.

Viscount MELBOURNE concluded the debate by a declaration that he intended to support the second reading of this bill, because he considered it an improvement on the present system of corn laws. At the same time he gave notice, that at another stage of it he should take the sense of the House on a proposition for a fixed duty.

The gallery was then cleared, and three divisions took place. The numbers were—For the second reading, 119; against it, 17. For Lord Brougham's amendment, 5; against it, 109. For Lord Stanhope's amendment, 17: against it, 119. The committee on the bill was then fixed for Thursday.

Tuesday.—After the presentation of petitions, on the motion for reading the order of the day for the House resolving itself into a committee on the Corn Importation Bill, Lord MELBOURNE rose and moved the following resolution: "That it is the opinion of this House that a fixed duty on the importation of foreign corn and flour will be more advantageous to trade, and more conducive to the welfare of all classes of the people, than a graduated duty, varying with the average of the prices of the markets of this country." Two questions, he said, had been submitted to the House last night—first, whether any duty should be imposed on foreign corn at all; and secondly, how was that duty, supposing a duty to be expedient, to be imposed? He should be for a free trade in corn at once, if he could bring himself to believe that the supply of foreign corn would be so inconsiderable as some noble lords seemed to think; but he was of opinion that the supply of foreign countries would soon accommodate itself to our demand; and he feared that they would send us too much corn rather than too little. He was, therefore, unwilling to do away with protection altogether. Then came the question, how ought you to regulate that protection? He had no doubt whatever in his own mind that the best course was the imposition of a fixed duty on the importation of foreign corn. He had not stated any amount of duty in his resolution; he only called on their lordships to affirm a principle. He recommended a fixed duty with reference to the past in justification of the Government of which he had formed a part—with reference to the present, because he thought it was the best course that could be adopted—and with reference to the future, because he was perfectly convinced that one day or other it would be adopted and become the law of the land.

The Earl of RIPON said that this resolution, if acceded to, would annul the decision of the previous evening, in favour of the Government measure. He was of opinion that a fixed duty would not work very satisfactorily, if "fixed" it could be called, which would have to vary from 8s. to nothing, and from nothing to 8s. The graduated scale, he thought, gave more protection to the producer than the fixed duty; and he trusted that every man who valued the protection now given to agriculture would vote against the proposition of his noble friend, under which he saw, from the language which he had used, that a prospective abolition of all duties was certainly lurking.

The Earl of CLARENDON expressed his satisfaction at the progress which the question had made; but he thought that that protection which was proposed to be given last year to the agricultural interest, would have been a good and durable protection to them, at the same time that it would have been a boon to the consumer, and a benefit to the revenue. The agricultural interest, he said, could not expect to retain its present protection long; for the present bill had nothing of finality about it, and contained within itself the germs of its own ruin.—The Earl of WICKLOW supported the Corn Importation Bill in the conviction that while it would not in the slightest degree injure the agriculturists, it would prepare their minds for greater changes.

Lord VIVIAN spoke in favour of a free trade in corn, and said he should be glad if their lordships could agree to such a compromise as a fixed duty.—The Duke of CLEVELAND said he would support the Government measure, although he thought the protection it afforded to agriculture scarcely sufficient. He wished the question to be settled, and should have been glad that the noble Earl had declared more explicitly than he had done, that Government proposed the present as a final measure.—The Earl of RIPON in reply stated, that he hoped the present measure would be final. It should not be his fault if it were not.—The Earl of ROSEBERRY condemned the bill as having no pretensions to finality, and expressed his own approbation of a fixed duty as the scheme most likely to be permanent, and, on the whole, most free from objection.—The Marquis of SALISBURY defended the conduct of Government in bringing forward the bill, and vindicated the principle of a fixed duty.—Lord PORTMAN supported the motion of Viscount Melbourne, and said that the Government bill would unsettle all bargains between landlord and tenant.—The Earl of WINCHELSEA considered that the agriculturists would have more protection under the new bill than by the existing law.—Lord MONTEAGLE said he had come to the conclusion that a sliding scale was inexpedient to adopt, that it was indefensible in point of just reasoning, and was the greatest monster of legislation that the world had ever seen. He would support the motion for a fixed duty; but, at the same time, would vote for the Government bill, as a great improvement on the existing system. The noble Lord concluded by saying, that they would have no rest or safety until they made the trade in corn as free as air; and he was persuaded that the agriculturist was the individual in the community who would have the least cause to regret it.

Lord BROUGHAM said he approved, and was prepared to vote for, the resolution of the noble Viscount, not because he thought it perfect or approaching to perfection, but as a considerable improvement on the bill then before the House. He objected both to a fixed duty and to a sliding scale, if either were to be taken as a measure of finance or of protection; and concluded by declaring his determination to take the sense of their Lordships on three resolutions which he had laid on their table, declaratory of the expediency of abolishing all duties on the importation of foreign corn.

The Duke of WELLINGTON said, that as an abstract proposition there was no doubt that any duty was inexpedient on the importation of foreign corn—that was true. But Lord Melbourne looked a little further, as Government had done, in proposing this bill. The noble Viscount could not look at a measure for introducing foreign corn into England without seeing that it was necessary to give some protection to agriculture at the present moment; and he had therefore manfully expressed his opinion, that the best mode of giving it that protection was by a fixed duty according to the measure produced by his Government in the last Parliament. He confessed, however, that he had himself always considered the graduated scale to be the best mode of affording it protection; and under it prices had been steadier in England than in other countries. He considered that the commercial embarrassments of the country were not owing to the Corn-laws, but were the result of other circumstances, such as machinery and over-production. The noble Duke concluded by saying, that as a means to protect agriculture, and to maintain the cultivators of our soil in the condition in which they ought to be maintained, the present bill contained the system on which their lordships ought to act. He should therefore recommend their lordships to say "not content" to the resolution of the noble Viscount.

The Marquis of LANSDOWNE said he could not support the resolutions for a total abolition of the duties upon the importation of foreign corn, but would give his support to the resolution proposed by Lord Melbourne. He thought that if this country was destined by its position, by its wealth, and by its population, to rely on foreign countries for a supply of great part of its food, it ought to have recourse to a direct trade for it. He, therefore, implored their Lordships, whilst they retained some duty on corn as a protection to agriculture, to rely for it on those same sound principles of trade which prevailed on other subjects.—Lord FITZGERALD defended the measure of Government, and entered into an investigation of the different merits of the sliding scale and of the fixed duty, and gave his decided preference to the first over the second, as the best means of protection to the agricultural interest. Their Lordships then divided, when there appeared—For Lord Melbourne's motion 49, Proxies 22—71; against it 117, Proxies 90—207; majority against the principle of a fixed duty, 136.

A resolution moved by Lord BROUGHAM was then put, "That no duty ought to be imposed upon the importation of foreign corn for the purpose of protecting the agriculturist, by taxing the introduction of food," when there appeared, for the original motion—Contents, 96; non-contents, 9; majority, 87. Lord BROUGHAM then moved another amendment to the effect, "That it was impolitic to levy a duty on corn for purposes of revenue." Their Lordships again divided. For the original motion—Contents, 87; non-contents, 6; majority, 81. The bill was then committed; the report to be received on Thursday.

Thursday.—The Mutiny Bill, and the Marine Mutiny Bill, were read a third time and passed.

After the presentation of petitions, the Earl of RIPON moved the order of the day for committing the Corn Importation Bill.—Earl STANHOPE protested against the bill altogether.—The House then went into committee, and several amendments were moved by Earl STANHOPE and Lord BEAUMONT; all of which, however, were negatived without divisions, excepting one, proposed by Lord BEAUMONT, who moved the omission of the 17th clause, his object being to obtain the returns from the growers instead of the corn factors.

The Earl of RIPON thought, that to compel the grower to make the returns, would subject him to great inconvenience, without any corresponding advantage.—The Duke of BUCKINGHAM supported the motion for the omission of the clause.—The Earl of WINCHELSEA opposed it, as laying too great a burden on the farmers; but the Duke of CLEVELAND and Earl STANHOPE were of opinion that the farmers would willingly make the returns if they thought it was for their interest.—On a division, Lord Beaumont's motion was rejected by 80 to 12.

The various clauses of the bill were then agreed to; but on the schedules being proposed, Earl STANHOPE moved that the duties on barley and oats should remain as under the existing law. After a short discussion the motion was rejected by 50 to 7.

The Earl of MOUNTCASHEL then moved that, in reference to Ireland, sixty cities and towns in that country should be added to the schedule of places making returns. The House divided, when there appeared, for the amendment, 3; against it, 29; majority, 26.

The Bill was then reported to the House, and ordered to be read a third time on Friday, and the House resumed. The Merchants and Factors' Bill passed through committee.

Friday.—The motion for the third reading of the Irish Spirit Duties' Bill was opposed by the Bishop of DERRY and Lord MONTEAGLE, who said that by the proposed removal of the drawback, the Irish distillers would have to compete with those of Scotland, to whom the drawback was continued. This objection was admitted by the Earl of Ripon and the Duke of Wellington, who deferred the third reading in order to remove the inequality complained of. The Corn Importation Bill was then read a third time and passed.

HOUSE OF COMMONS.

Monday.—Viscount Ashley, as chairman of the Longford (county) election committee, brought up the report, which stated that Luke White, Esq., was not duly elected, and ought not to have been returned; that Anthony Lefroy, Esq., was duly elected, and ought to have been returned; and that the committee were desirous of calling the earnest and instant attention of the House to the confused and uncertain state of the law as regarded the elective franchise in Ireland.—Mr. Hayter, as chairman of the Cardigan election committee, reported that Pryse Pryse, Esq., was duly elected.—On the motion of Mr. Pakington, chairman of the Ipswich election committee, Obadiah Barwick Lucas was committed to Newgate for wilfully giving false evidence before that committee.

In reply to Mr. Hutt, Sir R. Peel said that he should be prepared to proceed with the tariff as soon as he had got the Income-tax well through committee. He hoped hon. members would discuss the tariff as a whole, and not item by item; as, if the latter course were pursued, they would find great difficulty in coming to any conclusion.

Sir R. Peel then brought up the Income-tax Bill; and on the motion that it be read a first time, Lord J. Russell rose and said that he entertained an insuperable objection to the bill; that the arguments with which he had met the proposal remained untouched by the right hon. Baronet and his supporters—namely, that this tax ought not to be imposed except in a time of extreme necessity; that a case of extreme necessity had not arisen; that there were no circumstances in the general state of the country which justified the measure; and that, financially speaking, there were other and less objectionable measures that might be adopted. His Lordship then referred to a speech made by Sir R. Peel in 1833, in opposition to an Income-tax, in order to prove that the right hon. Bart. had been guilty of inconsistency. The noble Lord then alluded to the exclusion of Ireland from the operation of the tax; and said, if circumstances rendered it necessary to have recourse to so odious a tax, it ought to be extended to Ireland as well as England and Scotland. He blamed Sir R. Peel for the gloomy views which he had presented of public affairs. He said that credit was due to the late Government for the present state of Canada; he thought that the position of Europe gave no indications of immediate danger; that our disaster in India was one but little affecting our financial means; and that the contest in China had been so much exaggerated, that one would almost have supposed the Emperor of China to be as formidable a foe as the Emperor Napoleon. The general principles of the tariff, he said, had certainly his approbation; but if those principles had been earlier avowed by the party opposite, he thought that less alarm would have been created among the people, who, he said, were generally lovers of plain dealing. The noble Lord concluded by saying that he had no new proposal to make. His last suggestion had been negatived, and he now had only to move that the bill should be read a first time on that day six months.

Sir R. Peel, after observing how unusual a step it was to oppose the first stage of a bill brought in upon resolutions of the House, admitted that, in 1833, when there was a surplus of 1,516,000*l.*, he had certainly opposed a scheme for taking off the house and window taxes, and replacing them by the imposition of a Property-tax; and even now, if the Exchequer were in possession of a surplus of 500,000*l.*, and a proposition were made to reduce the malt-tax, the house-tax, and the window-tax, and to substitute in lieu of them a Property-tax, he should again offer to such a proposition the most strenuous opposition. The events in India were represented as insufficient to justify a strong measure of finance; but independently of India, he lamented to say, that in the last six years there was a deficit of 10,000,000*l.*; and that deficit, he feared, would be increased next April by 3,000,000*l.* more. Add the loss to be expected at the outset from the changes in the tariff, being 1,200,000*l.* more, and the total deficit would be 4,200,000*l.*, which he thought he could raise in no mode so effectual as by a charge on the comparatively affluent classes. He then said that he proposed to make some modification by way of relief to tenants in Scotland; reducing the per-centage upon their occupations from 3*d.* to about 2½*d.* in the pound. And in order to make the working of the act less inquisitorial, he would give to the payer of the Income-tax an option of paying it to a special commissioner instead of paying to the ordinary officer of his own neighbourhood. The right hon. Baronet concluded by saying that there were indications throughout the country of a strong opinion in favour of maintaining public credit, and of doing so rather at the expense of the richer than of the working classes.

Mr. Villiers said the question was, whether public credit should be kept up by the imposition of fresh taxes or by the abolition of monopolies. He denounced what he termed the ridiculous hypocrisy of the objection against slave-grown sugar; and said that if the sugar-duties were reduced as they ought to be, sugar would come in as largely from the Philippines and other islands of the Indian seas as from the slave plantations of Cuba and Brazil; for that description of Indian sugar could be grown quite as cheaply. After a few words upon the subject of corn and timber, he maintained the expediency of a loan as a legitimate resource, while the revenue was in a course of such restoration as might be expected from the now proposed relaxations of commerce.—After a few remarks from Mr. Hardy in support of the measure, Mr. Rice said that though he would have preferred the budget of the late Ministry, he was not disposed to deny the advantages of the present plan, and would support the first reading. But he thought it so unjust to tax the income of trades and professions equally with that of property, that unless the bill were modified in this particular, he must vote against it on the third reading.

Mr. F. Maule defended himself for the delay he had interposed before the Easter holidays, and said that he had found that his own constituents did not disapprove the course he had taken. He could not but think that the working people would find their employment diminished by this tax, and that then their discontent would begin. He believed the generality of those commercial men who approved this measure were persons interested in the maintenance of the West Indian monopoly. He thought the emergency not sufficient to justify the demand, and deprecated what he considered a delusion upon the lower classes.—Mr. Milnes denied that Ministers had taken any tone of despondency. The testament of the late Government, he thought, had been like that of a distinguished literary man, who had left various good legacies to his children—his industry to one, his patience to another, and so on; but not a farthing of money to any of them. Concurring generally in this measure, he yet must wish some exception for the labour of the head as well as of the hands; as, for instance, a reduction of the proposed 3 per cent. to 2 per cent. on incomes not arising from property.—Mr. Currie considered the measure bold, honest, and comprehensive, and not more objectionable than any other large scheme of taxation must be. He said that among men of all opinions in the city of London, he had not met with one who did not say, that taking the whole measure together, he would himself have voted in its favour. The hon. member then took a survey of the present state of parties, and declared his belief that the present Opposition was a helpless and hopeless one, because, professing popular opinions, it had yet no particle of popular sympathy on its side. He said he looked forward to further benefits from Sir R. Peel, who, he trusted would follow out his own enlightened views, unfettered by the narrow protectionists of his party.—Mr. T. Duncombe began with a severe invective against the Government, the tax, and the Conservative party, whom he described as willing to submit to anything to keep Sir R. Peel in power. He considered that this tax would produce infinite distress. He referred to the evasions and surcharges produced by the old Income-tax, and concluded by reading some of the inquisitorial questions administered under it to persons in business.

Mr. Roebuck supported the measure before the House, and the whole scheme of Government as preferable to that of the noble Lord. It was, he said, a matter of congratulation to the country that it had now a Ministry bold enough to propose the present scheme, and strong enough to carry it. He would not be put off with the generalities of the noble Lord; he must support the plan which showed him practically how the money was to be got; nor would he be frightened with the bugbear, the cuckoo-note, of the inquisitorial character of the tax. If the people disliked the tax, they should turn out all the members who had voted for the expenditure. He, therefore, was for the first reading of this bill, but in committee he would try to remedy the injustice of taxing income equally with property.—Mr. Wallace opposed the bill, and said he would take care that it should not pass till after the tariff.—Mr. S. Crawford expressed his intention to vote against the bill.—Mr. Cobden opposed the tax, not as an Income-tax, but as he would oppose any tax levied to fill the pockets of particular classes. First, he said, abolish the monopolies, and then come to the country for aid.—Mr. Muntz said he would rather have an Income-tax with a Property-tax, than have no Property-tax at all; and he should vote for Sir R. Peel's bill, because he thought it the best plan for the great body of the people.—After a few words from Mr. Rundle, the House divided, when the numbers were—for the first reading, 285; for the amendment, 188; Majority, 97. It was then arranged that the motion for the second reading should come on on Friday.

Tuesday.—The Speaker informed the House that he had received a communication stating that the petition against the return for the Elgin Burghs had been abandoned.

Lord Stanley, after several questions had been put by Mr. P. M. Stewart upon the subject of emigration, replied by entering into a lengthened statement as to the amount of demand for labour in our Australian colonies and Canada, and the degree in which that demand was supplied by voluntary emigration. It appeared from his Lordship's statement that there is no demand at present for labour in the Australian colonies, which already contain a great many more emigrants than can find employment. He said that his noble Friend who had preceded him in the Colonial-office knew that there had been about 40,000 emigrants sent out in 1840, at a cost of about 800,000*l.* or 900,000*l.* During the last year the actual amount of emigration to the colony of New South Wales had been 22,750. By the last accounts received from the governor it appeared that 12,750 emigrants had arrived, and that 10,000 more were on the road. These 12,750 had involved the colony in a debt of 11,000*l.*, and what, he would ask, must be the distress occasioned when they found there were 10,000 more coming out? The governor stated that at that time there was no demand for labour in the colony, but that, on the contrary, there existed the greatest difficulty in providing labour for those emigrants who had recently arrived there. Lord Stanley proceeded to say that he felt it to be his duty to make this statement thus publicly, in order to show that at present there was no demand for labour in that colony, and that emigration could not be pushed beyond a certain point unless capital emigrated likewise; and if capital did not emigrate, those who emigrated without property would be exposed to greater distress than they were in in this country. He did not mean to say that the present state of things in New South Wales was likely to be permanent. On the contrary, he believed it would only be temporary; that it arose from the cessation of the land sales for some time past, which had ceased in consequence of the commercial embarrassments of the colony. He believed that the colony would be able to absorb a continual stream of emigration, provided they did not attempt to pour in too many emigrants at once. It was the opinion of the governor of the colony that the colony was capable of receiving annually from eight to ten thousand emigrants. With respect to Van Diemen's Land, he had at the present moment at his command a sum, the produce of land sales in that colony, which might be devoted to the purposes of emigration. The colony was capable of absorbing about 1,500 emigrants annually, and that number had already emigrated thither in the course of the present year. Western Australia was a colony of very limited capacity for receiving emigrants; but, without any ambitious views, it was going on very steadily and prosperously, and demanded annually a supply of from 150 to 200 emigrants. Preparations were already made for sending out that number in the course of the present year. He need hardly say that in consequence of the disastrous state of South Australia last year, the land sales in that colony had for the present altogether ceased. The last account that he received from South Australia informed him that in consequence of the cessation of the large Government expenditure for public works, the extravagance of which had greatly conduced to produce the existing state of distress, so many persons had been thrown out of employment, that out of a population of 15,000 souls, 1,200 were living as paupers, being maintained out of the public funds from want of employment. With respect to the colonies of New Zealand, he could hardly speak of them with the same confidence as those of Australia. There was, however, a sum of from 10,000*l.* to 12,000*l.* available for sending out emigrants to the Government settlements in New Zealand; and upon the whole he thought, perhaps, that the New Zealand settlements offered a more probable field of employment for labourers than any of the other colonies in that quarter of the globe. He had reason, however, to believe that in those settlements the amount of immigrating labourers had pretty nearly overtaken the amount of capital capable of affording them employment, and that the wages of labour, which a short time since were high, had now fallen very materially. In the North American colonies the state of things was very different. He believed that those colonies did at this moment hold out very favourable prospects to labouring emigrants. Last year 28,000 labourers emigrated to North America, and although some of them passed into the United States, he believed that the great portion found immediate employment in the British provinces. There were undoubtedly very cheering prospects for the labouring classes in those colonies. But it was advisable that all who went there should go early in the spring, so as to get themselves comfortably settled before the approach of winter. He would further earnestly recommend all those who desired to emigrate to North America, to take steps to place themselves under the advice and superintendence of the Government agents at the different ports at which they arrived; for although the Government agents were not empowered to render them any pecuniary assistance, they were capable of giving them the best advice as to the part of the colony in which there was the greatest demand for labour, and where the immediate wants of the emigrants could be best supplied.

Questions on the subject of Syria were put by Dr. Bowring and Sir C. Napier.—Sir R. Peel stated, in reply to an inquiry whether the Porte had refused to remove Omar Pacha from the government of Lebanon, that he thought a more improper appointment than that of Omar Pacha could not have been made, and that the British Government had accordingly remonstrated with the Porte against his continuance in office. He considered that there were circumstances in the life of that officer which made his appointment a very unwarrantable one. Assurances had been received from the Porte that Omar Pacha should be removed, and that some other arrangement should be made for the administration of the affairs of Lebanon. He also regretted to say that the Porte had thought it expedient to send Albanian troops into Syria. In consequence, however, of representations made by Sir S. Canning, our ambassador at Constantinople, assurances had been received from the Porte that the Albanian troops, whose numbers he believed had been very considerably over-stated, should not be employed in the interior, but only on some particular parts of the coast of Syria. The justification for employing them at all was the great loss of life to the Turkish troops stationed in these particular localities. The assurance was positive that they should not be employed in any of the districts of the Lebanon.

Mr. Ferrand then moved for a select committee on the subject of the frauds and oppressions imputed by him to certain manufacturers. He enumerated various gross frauds which he said were committed in many branches of manufactures, and called upon Government to assist in protecting purchasers and the country itself, whose honour was at stake, against the repetition of practices which injured the poor at home, and destroyed the reputation of British manufactures abroad. He then proceeded to the hardships inflicted by fines enforced at each week's end against the workmen for unreasonable causes, and to the oppressions of the truck system, in condemnation of which he quoted the authority of many eminent statesmen, and concluded with an energetic appeal to the House to do justice to the poor.

Mr. Fielden thought it time to apply a remedy to the evils which had been complained of.—Mr. Wallace wished for inquiry, and for some mode in which the poor might get justice cheaply.—Mr. Wakley suggested that, in order to do full and complete justice, the inquiry should include the agricultural as well as the manufacturing employers; and concluded by proposing an amendment to that effect.—Col. Sibthorp was willing to agree to the amendment, from a firm conviction that the agriculturists would come clear out of the inquiry.—Mr. Brotherton would rather have the inquiry confined to the manufacturers; and he believed it would turn out, that for one truck-master who belonged to the Anti-corn Law League, there were ten who did not.

Sir J. Graham could not believe that the general dealings of our manufacturers were other than honest and respectable; he apprehended that the instances adduced were but exceptions. At all events, the remedy against such frauds must be sought, not in further legislation, but in the competition of fair traders. He was reluctant to enter into so large an inquiry as was now proposed; and for this reason especially—that he found it would encourage a party feeling against the manufacturers, which he was not desirous to keep up. He was, however, willing to agree to an inquiry into the truck system; and he therefore moved, as an amendment, that a select committee be appointed to inquire into the operation of the law which prohibits the payment of wages otherwise than in the current coin of the realm.—Mr. S. Wortley thought that Sir J. Graham had taken too favourable a view of the matter.—Mr. Muntz and Mr. M. Philips vindicated the merchants and manufacturers of the country.—After some observations from Mr. Plumptre and Mr. Yorke, Mr. Cobden declared himself well content with the line now taken by Government, but regretted that Ministers had not interfered earlier, when Mr. Ferrand first levelled his charges against the Anti-corn Law League, amid the cheers and smiles of his party. Our trade, he said, would not be, as it now was, the most extensive in the world, if our manufactures were generally spurious.

Sir R. Peel denied that Government had anything to do with the defence of the Anti-corn Law League, or with the cheers and smiles of hon. Members. As to the inquiry asked for by Mr. Ferrand, he could not consent to an investigation which set out with assuming that the great body of British manufacturers were dishonest men. The true security, he thought, was in free competition and the vigilance of the purchaser. He strongly condemned the abuses of the truck system; but he thought that in some cases, as in the case of a mine at a distance from any town, a shop established by the master was a great benefit instead of an injury to his workmen. He believed, therefore, that a general prohibition of all payments to workmen in any medium but money would not be usefully practicable.—After a short discussion, in which Mr. Villiers, Mr. Hardy, Dr. Bowring, and several other members joined, Mr. Ferrand withdrew his motion, and Sir J. Graham's amendment for a select committee to inquire into the truck system was agreed to.

Mr. Serg. Jackson, the Solicitor-General for Ireland, obtained leave to bring in a bill to assimilate the law in Ireland, as to the punishment of death, to that of England; and to abolish the punishment of death in certain cases.

Wednesday.—On the motion of Mr. Pakington, John Thornton was committed to Newgate for wilfully giving false evidence before the Ipswich Election Committee. A discussion then took place upon the motion for the third reading of the Kingsclere Inclosure Bill. The motion was strongly opposed by Mr. Wakley, who moved, as an amendment, "That the minutes of evidence taken before the Kingsclere Inclosure Committee be laid on the table of the House."—Several other Members also spoke against the Bill, and the House divided, when there appeared against the amendment, 111; for the amendment, 30; majority, 81. The question was then put, that the Bill be read a third time. Mr. Wakley protested against the passing of the Bill. He said that if any jury out-of-doors had acted as that House had just done, they would be designated as a set of unworthy scoundrels. He should meet the question with a direct negative.—The gallery was again cleared for a division. For the third reading, 118; against it, 26; majority, 92. The Bill was then read a third time. On the question that the Bill do pass, Mr. Godson said, that he should move the addition of three clauses to the Bill: but if the House were against the first, he should not divide upon the other two. The substance of the first clause was, that persons who had held the land for less than 20 years, but had erected cottages thereon, should be entitled to purchase such land at the price per acre of the surrounding land. The second clause had reference to certain charity lands in the parish; and the third clause was one which was introduced into the Bill of 1834, but had been omitted from the present Bill. It was founded on the report of the committee of that day, and the substance of it was that those commoners who had been in possession of their land for more than 20 years, should have two acres of common attached to them as of right. The House divided on the first of these clauses, when there appeared for the clause, 45; against it, 72; majority, 27. The other clauses were negatived without a division. The Bill then passed.

The House went into committee upon the Licensed Lunatic Asylums Bill, in which Mr. Wakley proposed that medical men, instead of barristers, should be appointed as commissioners of lunatic asylums. This proposition not appearing to find favour with the House, the hon. Member modified it by moving that it should be left to the Lord Chancellor to select members of either profession for the office, and in this shape the House affirmed the amendment by a majority of 11.

The further consideration of the measure was then postponed, and the Copyright Bill having gone through committee with only a few verbal amendments, the Public-house Regulation Bill was read a second time.

Thursday.—The Ormsby Inclosure Bill, the Birmingham and Derby Junction Railway Bill, the St. Austell Market Bill (No. 2), Bassen's Naturalization Bill, and Gilbert's Naturalization Bill were severally read a third time and passed.

In reply to a question from Mr. Mangles, Lord Stanley stated, that his observations on Tuesday, on the subject of Emigration had been misunderstood. What he said was, that with respect to New Zealand he could not speak with the same confidence as to some other of our colonies; but that in the Government settlement of Auckland there was a considerable demand for labour. He had also stated that there was still the sum of 1,200*l.* in the hands of Government, applicable to the encouragement of emigration to that colony. With respect to New Zealand, he said the company were better able to judge of the proportion which capital ought to bear to labour; but he did say, that he believed that at Port Nicholson, to a certain extent, wages had fallen, and a number of persons were employed on the public works.—Mr. S. Crawford brought forward a motion, stated at considerable length, the purport of which was to pledge the House to take into its early consideration what are commonly known as the "five points of the Charter," namely, extension of the suffrage, division of the country into equalised electoral districts, vote by ballot, annual Parliaments, with the payment of members of Parliament, and abolition of qualification. He did not ask the House to pledge itself to all these points, but to go into the consideration of them, with a view to a full and fair discussion. He was aware that the proceedings of many of those calling themselves Chartists, had brought great discredit on the cause of reform, but he brought his motion forward from a conviction of duty, and without reference to individual considerations.—Mr. O'Connell seconded the motion.—Mr. Wallace gave the proposition his cordial support, and said that the Reform Act had proved an entire failure, as evidenced by the gross corruption which prevailed in the country during the last general election, and also by the composition and character of the majority of the House.

Dr. Bowring urged the necessity of attending to the petitions of the people, more especially of the unrepresented. He was of opinion that franchise, so far from depending on property, ought rather, on a principle of compensation, to be most largely bestowed on those who lacked all other valuable possessions. He had always been for annual elections: our habits, our nature, the course of the seasons, seemed to recommend that arrangement. He was for abolishing all property qualification, and paying members for their services. After some observations from Mr. W. Williams and Mr. Ward in support of the motion, Sir J. Graham rose and briefly opposed it. He said there was no disrespect shown on his side of the House to the masses of the people. At the time of the Reform Bill, it was frankly avowed that the suffrage was to rest on property, and not on numbers; and the safety of the monarchy and the aristocracy depended on the maintenance of the same principle.

Mr. O'Connell said he was surprised to hear this from Sir J. Graham, seeing that he himself had repudiated the same notion when it was used against the extension of the suffrage created by the Reform Bill. The people of England, he considered, were divided into two classes, the master class and the slave class, the latter being the numerous unrepresented portion of the community. He should support the motion.—Mr. Wakley said he had high constitutional authority for the assertion that every man who had not a vote was a slave, for money was taken from him without his consent. He was for a wide extension of the suffrage, and was astonished to find it contended that that extension, giving, as it would, contentment to the people, would endanger the monarchy.—Messrs. Yorke, Protheroe, and Bernal spoke in favour of the motion.—Sir J. Easthope made a few remarks in opposition to it.—Sir C. Napier said he should neither support universal suffrage nor annual Parliaments. He should, however, vote for the motion, as leading to inquiry.—Mr. Villiers considered that, after ten years' experience of the working of the Reform Act, and the glaring proofs of its ill working, he had sufficient ground for his support of the motion, as one of inquiry.

Sir R. Peel then rose and said, that though disclaiming all disrespect, either to the petitioners of the House or to Mr. Crawford, who had so fairly and temperately stated their case, he must decidedly oppose the motion. He had prophesied at the time of the passing of the Reform Bill, that it would be his fate to defend it from its warmest supporters, and his prediction was now verified. He was sorry that Lord J. Russell was not present to defend his own measure. It was contended that representation should be coequal with taxation; but that principle, based, as was alleged, on "the laws of nature," was met by these very laws, and rendered inapplicable, as in the case of women. He next proceeded to the consideration of the second portion of the present motion, namely, that with reference to triennial Parliaments. On that point, a more shabby argument he had never heard; and what had been said by the hon. Member for Bolton, Dr. Bowring? Why, that triennial Parliaments contradicted the course of nature—that the earth made its revolution round the sun in the course of the year, and then he added, that the merchants of this great country annually settled their accounts, and argued with great bathos, on the double position of astronomy and commerce, that the practice of the discreet merchant would be in favour of Parliaments being annual. Reviewing the different propositions involved in the motion, what he now heard of the working of the Reform Act disinclined him to entertain any new change, and though he would admit that our representative system was not free from defects, he yet believed that sympathy with the people would be better shown by passing his Income-tax and his financial measures, as being better calculated to benefit them. The absence of Lord John Russell and the late ministers had been commented on; members opposite could retaliate by staying away on Friday on the second reading of the Income-tax bill.

Mr. Muntz believed that the country had not got the real Reform Bill as originally intended.—After some observations from Mr. Turner, Capt. Plumridge, and Mr. Cobden, in support of the motion, Mr. Roebuck disapproved of the taunting spirit and laughing manner with which Sir R. Peel had treated the motion. The point at issue was, can a large portion of the labouring people be admitted to the franchise? and the answer was, No. The aristocracy had no monopoly of virtue or intelligence; why should they shut the door against inquiry? They dreaded the downfal of their monopoly of political power.

Lord Stanley, as one of those who had been a party to the Reform Bill, denied that the franchise had ever been considered as an inherent right. It was a great political privilege, which had been largely extended, from a conviction that the time was come when it was safe to do so. He had joined with Lord J. Russell and the Whigs of those days, in declaring that it was not safe to have a revolution every ten years; and he was sorry that the noble Lord and his colleagues were not present to aid him in saying so now. He felt it to be his duty to resist this crude notion, which unsettled everything and settled nothing.—Sir T. Wilde opposed the motion, because it could not lead to any practical good, and condemned the charge made by Mr. Roebuck against Sir R. Peel, that he had spoken in a spirit of disrespect towards the people.—Sir R. Peel acknowledged his obligation to the hon. and learned Gentleman for his just construction of what he had said.—After a few words from Mr. Blewitt, and Mr. S. Crawford in reply, the House divided—for the motion, 67; against it, 226; majority, 159.

The report on the Copyright Bill was brought up, and the bill, with the amendments, was ordered to be printed.

Friday.—On the order for the second reading of the Income-tax Bill, Mr. C. Buller moved that it be read that day six months. In a speech of some length, he contended that it was inquisitorial, and said the only just tax was that which affected enjoyment and expenditure, not that which affected mere income; and that the House ought not to tax as heavily the father of a family, who was obliged to lay by a part of his income, in order to afford them a provision, as the bachelor, who could expend his whole income upon his own enjoyments. Mr. Ewart and Sir J. Walsh spoke in favour of the measure. After some observations from Sir W. Clay, Mr. Wakley, Mr. D'Israeli, Mr. Christie, &c., the House divided, when there were—for the Bill, 155; for the amendment, 76: majority for the second reading, 79.

CITY.

Money Market, Friday.—Consols for money closed at 91½ to ⅝; for the account, 91⅝ to ¾; Three per Cents. Reduced, 90¼; Three-and-a-half per Cents. Reduced, 99⅝; New Three-and-a-half per Cents., 100½ to ⅝; Bank Stock, 165 to 166; and India Stock, 244 to 245.

Metropolis and its Vicinity.

Improvements on the Thames.—The corporation of London have given leave for the erection of a pier at Greenhithe, and it is said that a meeting of the inhabitants will shortly be held for the purpose of giving effect to the permission.

Metropolitan Post-Office.—It is stated in the morning papers that upwards of 50 persons employed in the Post-Office department have been detected, during the last three months, purloining letters of value. The principal number of letters stolen appear to be those containing jewellery. A clerk in the General Post-Office was committed to Newgate a few days since, on whose person three letters, containing jewellery, were found secreted; he was employed to despatch the South of England mails, from which a large number of letters have been extracted during the last six months. The president of the stolen-letter department has a number of assistants constantly engaged in tracing the particular office in which letters are stolen; and it is said that several hundreds of lost letters have been sometimes reported to the Postmaster-General in a single day. The legal expenses incurred in prosecuting post-office criminals amounted last year to above 10,000*l.*; and it is calculated that property, consisting of money, jewellery, &c., amounting to above 50,000*l.*, was lost in passing through the Post-Office during a period of twelve months.

Public Meetings.—On Saturday a public meeting was held of the subscribers for a monument to the memory of the Rev. Dr. Goodall, late provost of Eton College, to nominate a sculptor in the place of the late Sir F. Chantrey, his executors having decided that the work intrusted to him was not sufficiently advanced to justify them to persevere in its completion. The chairman, Lord Braybrooke, said that the executors of Sir F. Chantrey having informed the committee that it was out of their power to complete the monument confided to them for execution, the committee deemed it proper to call a public meeting of the subscribers, in order that they might appoint an eminent artist to undertake it. The sum of 1,000*l.* given to Sir F. Chantrey had been handed back by his executors, and lodged in the funds. The committee, without attempting to control the subscribers, submitted to their attention three artists, viz., Messrs. Baily, R.A., Behnes, and Campbell. The Rev. Dr. Hawtrey eulogised the abilities of Mr. Behnes, who had executed the statues of the late Lord Chief Baron Joy, Lord North, and Babington. It was then proposed that the selection of a sculptor be confided to the committee, which was carried unanimously. Earl Howe, Earl Camden, the Provost of Eton, and the Rev. Sir H. Dukenfield, were added to the committee.

Spitalfields.—Some interest has been excited by the announcement that a ball, on a scale of great magnificence and under the immediate patronage of her Majesty and Prince Albert, will take place at her Majesty's Theatre on the 26th May, for the purpose of giving encouragement to the manufacture of British silk. The proceeds arising from the ball will, it is understood, be contributed towards the support of a School of Design, and the erection of a suitable building, where the children of the Spitalfields weavers may be educated; with the view of bringing the art of silk weaving, both in the manufacture of the article and the invention of designs, to such perfection that the English artisan may be enabled to excel the productions of the foreign manufacture. It is also expected that her Majesty and Prince Albert will honour the ball with their presence.

Police.—Intelligence reached town on Saturday evening that Daniel Good had been apprehended at Tunbridge Wells. It appears that the prisoner after making his escape from Town, engaged himself as a bricklayer's labourer in the neighbourhood of Tunbridge Wells, and continued in this employment unsuspected until Saturday morning. By a singular coincidence, however, it seems that one of his fellow-labourers was a discharged policeman, who had formerly been stationed in the neighbourhood of Roehampton, and who had frequently seen the prisoner when in Mr. Shiell's employ. Being struck with his resemblance, he charged the prisoner with being the murderer, which the latter denied; but the man persisting that he was not mistaken, gave the prisoner in charge to a policeman, and his identity was soon satisfactorily proved. He was removed to town, and has since undergone an examination before the magistrate at Bow-street. The evidence adduced against him was the same as has already been before the public, and he has been committed to Newgate to take his trial for the murder. Mary Good, the wife of the prisoner, and a man named Gambell, have been apprehended, charged with being accessories after the fact, and have been remanded for further examination.

Woolwich.—Amongst the numerous inventions submitted to the Lords Commissioners of the Admiralty, and referred by their Lordships to the committee of master shipwrights recently sitting at Woolwich dockyard, was a composition to be used in place of the substance with which vessels are at present caulked to render them water-tight. The experiments were ordered to be made by the master shipwrights to ascertain its value when applied to the purpose for which it is intended; and the results are interesting. Two pieces of African teak, a species of wood difficult to be joined together by glue, on account of its oily nature, had a coating of the composition applied to them in a boiling state: and, in a short time afterwards, bolts and screws were attached to each end, the joined wood placed in the testing-frame, and the power of Bramah's hydraulic engine applied to the extent of 19 tons, when the chain broke without any strain being susceptible where the joining took place. A larger chain of 1¼ in. in diameter was then applied, which broke with a strain of 21 tons, the joint in the wood remaining apparently as firm as at first. The utmost strain the cement can bear in this form, therefore, remains to be proved when experiments are made with larger chains. Four pieces of hard wood were then joined together, weighing in one piece 44 cwt., and carried to the top of the shears in the dockyard, a height of 76 feet, from which it was precipitated on the hard granite wharf wall below, without any of the joints yielding in the smallest degree. The results of these tests induced the Lords Commissioners of the Admiralty to communicate with the Master of the Ordnance, Sir G. Murray, for the purpose of making experiments with it in the marshes, by bringing the full force of cannon balls against it. Accordingly, a number of planks of oak 8 in. thick and fir 16 in. square were joined together with the cement, to represent eight feet in height and eight feet in length of the side of a first-rate ship of war, without anything else in the shape of bolt or security to assist the composition; and on Wednesday it was set up as a target at the butt in the marshes. Three new 32-pounder guns having been placed at 400 yards distance on point-blank range, three shots were fired, every one entering the target, the third in a direct line with the bull's eye within three inches of its outer circle. The effects of these shots were, that the wood was torn to pieces; and it was only in one instance where the joint had not been good that they produced any effect upon the cement, so as to separate the joined parts from each other. A hole 6¼ in. in diameter was then bored in the centre of the target, and a 32-pounder shell inserted and exploded by a match, which tore the wood to small splinters without at all separating the composition. This new invention is said to possess the power of expanding like India rubber in warm climates. It will not become brittle under the coldest temperature, and has the appearance of French polish. The name of the inventor is Mr. Jeffrey.

Provincial News.

Brighton.—A local paper informs us that within the last few days a discovery has been made in connexion with Messrs. Wigney's bankruptcy, which has produced a considerable sensation in this town. It appears that Mr. George Wigney, the brother of the bankrupts, gave the assignees certain information which induced them to search his premises, where they found, in a loft, a large quantity of wearing apparel and plate, of the estimated value of from 400*l.* to 500*l.* The goods were seized by the officers, and removed to the late residence of Mr. Wigney, one of the bankrupts, and have since been lotted with the other articles. In consequence of this discovery, posting-bills have been issued with a caution to parties against concealing the goods of the bankrupt, whereby they would render themselves liable to a fine of 100*l.* It is also stated that a messenger has proceeded to London for the purpose of summoning the late butler to Mr. J. N. Wigney, who is expected to make important disclosures in regard to property removed.—It is stated that a dispute has taken place between the Brighton Railway Company and Lord Lowther, the Postmaster-General, respecting the price for conveying the mails by railway, which it is feared may end in depriving the inhabitants of this town of a day mail from London. The mails, it is said, can be sent by coach on the common road for about half the cost of what the railway directors charge for conveying them by railway. The arrangements for taking off the Portsmouth and Brighton mail are in abeyance until the dispute between the company and the Post-office is finally settled.

Chelmsford.—On Tuesday, pursuant to a requisition to the high sheriff, signed by Lords Rayleigh and Western, and a number of other freeholders and farmers of the county, a meeting took place at the Shire-hall, in this town, for the purpose of considering what steps should be taken in reference to the alterations in the Corn-laws and the tariff of duties proposed by her Majesty's Ministers. A letter was read from Lord Western apologising for his absence, on the ground that the fatigue of attending the debates in the House of Lords rendered it impossible for him to be present. Lord Rayleigh also excused himself on the same ground, and concluded his letter by saying, that he had signed the requisition because he felt that the proposed alteration of the law was calculated to affect a great change in the condition of the farmers, and that they ought to have an opportunity of being heard. J. T. Fortescue, Esq., the high sheriff, took the chair. Mr. J. Bawtrey, in a long address, proposed a petition to the House of Lords, praying that the proposed Corn-law and tariff might be rejected, or at all events materially modified, and at the same time expressing an opinion, that if passed in their present shape, they would be ruinous to the interests of the agriculturists. The motion having been seconded, Mr. Tufnell moved an amendment, that the meeting, viewing with regret the condition in which the country had been left by the late Government, and hoping that the proposed alteration in the Corn-laws would have the effect of alleviating some of the distress, which was by some attributed to those laws, consented to the proposed alteration in the Corn-laws; but at the same time directed the attention of the Legislature to the proposed new tariff, and prayed that such steps would be taken with regard to it as would give proper protection and encouragement to agriculture. Mr. Elmes seconded the amendment; and, after several gentlemen had addressed the meeting, the high sheriff put the motion and the amendment to a show of hands, and the motion for a petition was carried by a large majority.

Dover.—On Sunday, one of the coaches running between this town and Ramsgate was stopped by two officers of the Customs; and on searching it a large basket was found containing eighteen bottles of eau de Cologne, several bladders of foreign spirits, a small quantity of tobacco, tea, and other articles. A passenger inside the coach, who proved to be a Frenchman, claimed the basket in consequence of which he was taken back to the Custom-house, and the following day committed for the penalties.

Exeter.—The local papers inform us, that at the recent quarter sessions for the county, the Earl of Devon, in his charge to the sessions grand jury, took the opportunity to refer to the bill intended to be brought in by Government for the improvement of the present county constabulary force, and said that from what he had heard of the details of the proposed measure, he was inclined to think it one that would give very general satisfaction. It would, he said, enable two or three parishes to unite, for the mutual raising and paying a sufficient number of properly qualified persons to act as constables, without infringing any local privilege.

Lancaster.—A fatal accident, occasioned by the bursting of a steam-boiler, has occurred on the premises of Messrs. Gisborne and Wilson, calico-printers, Pendleton. It seems that the boiler was set to work at the usual hour on Monday morning, and continued to work until nine, when a sudden rent of four or five feet in length took place at a line of rivets along the lower margin, and the steam and hot water rushed through with such violence, that all the brickwork in front of the boiler was completely torn away. The fireman and two young men, who were standing before the fire, were so severely injured, that the former expired the same evening, and the two young men continue in a precarious state.

Oxford.—Two Theological Professorships have been recently instituted by the Crown in this University, and a temporary endowment of the Professors, until canonries of Christ Church shall fall vacant, to be permanently attached to the Professorships, has been provided by the University. It is stated that Sir Robert Peel has presented the Professorship of Ecclesiastical History to the Rev. Mr. Hussey, of Christ Church, late censor of that college; and the Professorship of Pastoral Theology to the Rev. Mr. Ogilvie, of Balliol, the rector of Ross.

Railways.—The following were the receipts of the principal railways during the past week:—York and North Midland, 1,618*l.*; Edinburgh and Glasgow, 2,100*l.*; Midland Counties, 2,552*l.*; Great North of England, 1,338*l.*; South-Western, 5,506*l.*; Birmingham and Derby, 1,068*l.*; Northern and Eastern, 1,252*l.*; Great Western, 13,642*l.*; Birmingham, 16,802*l.*; Croydon, 392*l.*; Greenwich, 894*l.*; Manchester and Birmingham, 363*l.*; Eastern Counties, 921*l.*; Hull and Selby, 912*l.*; Birmingham and Gloucester, 1,098*l.*; Blackwall, 745*l.*; Brighton, 2,618*l.*—A serious circumstance occurred at the Yatton station on the Bristol and Exeter railway, on Saturday, which fortunately ended without any untoward consequences. It seems that one of the down-trains having stopped at the station, was detached from the engine for the purpose of placing on another luggage-waggon, when the engineers left their situations, and by some unforeseen cause the steam got up, and the engine started off without control. Great alarm prevailed down the line in consequence of the engine's passing at a rapid rate, without any one on it; but, fortunately, about a mile before it reached Bridgewater the steam was exhausted, and it stopped. As soon as it was known at the Bristol station, an express engine, with a number of hands, was sent off, but fortunately their services were not required.—A fatal accident occurred on Saturday to a passenger on the Midland Counties Railway, at the junction where the Nottingham line runs into the main line from Rugby. It appears that when deceased, whose name was Norman, arrived at the spot above mentioned he got out, and was standing by the side of the line at the time the train was moving backwards, when he ran on the line and was knocked down, and the wheels passed over him, inflicting such serious injuries that he died the following morning. An inquest was held, and a verdict of "Accidental death" returned.

IRELAND.

Dublin.—It is announced that his Excellency the Lord Lieutenant and the Countess de Grey purpose returning to the Castle from London by the third week in next month; and a ball will be given at the Castle on the 24th May, in celebration of her Majesty's birthday.—George Lecky Mills, formerly a clerk in the Bank of Ireland, charged, as noticed in a former Number, with having feloniously altered a Bank of Ireland note from 1*l.* to 30*s.*, has been tried and found guilty. He was sentenced to three years' imprisonment, and to be kept in solitary confinement for one month in each year. The Court stated that they had come to the determination of inflicting this mitigated punishment in consequence of the youth of the prisoner, and the strong recommendation of the jury, and that these circumstances alone saved him from transportation.—The latest accounts inform us that the health of Sir E. Blakeney is quite re-established, and that he will not not bear any mark of the serious wound which he experienced from the accident noticed in our last.

Cork.—At a recent meeting of the County Agricultural Association, a memorial to the Board of Trade was agreed to, founded upon the following resolutions:—1. That we view with great alarm the proposed scale of duties on agricultural produce, which, we conceive, would materially injure the interests of this country, by affecting almost all its exports. 2. That we consider we are the more entitled to be heard on this subject, inasmuch as the interests of this country seem to have been in a great measure overlooked in the corn bill, the duties on spring corn not being equal to those on wheat, in proportion to their respective values. 3. That the new regulations concerning bonded provisions appear to us particularly objectionable, and we also strongly protest against the proposed duties on tallow and lard, which, we consider, should be at least equal to that on beef and pork.—The large reward of 650*l.* has been offered for the apprehension and conviction of three sawyers, who, with two other persons now in custody, stand charged with having assaulted Mr. Wilson, one of the proprietors of the saw-mills in this city, by throwing in his face a quantity of vitriol, or some other deleterious acid, by which his life was endangered, and from the effects of which he has lost his right eye. The circumstances were noticed in a former Number. 100*l.* of the reward is to be paid by Government, on the apprehension and conviction of the offenders; 150*l.* by Government for information; 450*l.* by the corporation and citizens of this city; and 50*l.* by Mr. Wilson.

King's County.—A murder, which has created much alarm in the neighbourhood, has been committed near the village of Moneygall, in this county, bordering on Tipperary, and in the police district of Nenagh. Mr. Roberts, the confidential clerk of George Garvey, Esq., was shot through the head, close to the village in which he resided. He was on a car at the time, and a woman who sat next to him was so severely wounded that it is thought she cannot recover. It also appears that another woman was shot close to this village a few days before, and died on Monday. There is no cause assigned for these murders, the scene of which is the place where the mailcoach-guards have been recently fired at, as we noticed in former Numbers. A large reward has been offered by Government for the discovery of the murderers.

Limerick.—It is stated that an unusually large quantity of land is now letting out for potato gardens in this county, and that this change from grazing to tillage has greatly increased the demand for labour, and promises an abundant supply of the staple provision of the poor.—A local paper informs us that a few days since an attempt was made to burn down the oak forest of Portlaw, the property of the Marquis of Waterford, by firing the game covers on Bailycahane-hill, immediately adjoining it. The tenantry of the noble lord, with the police, wood-rangers, &c., soon assembled, and the flames were got under with the loss of only an acre and a half. There is no clue to the incendiaries, who again fired it in an opposite direction on Sunday, during divine service. Had the wind been high, it is thought that the entire woodland of 3000 acres must have been destroyed.

Queen's County.—A local paper informs us that the commercial crisis in the town and neighbourhood of Mountmellick, consequent on the recent failure of the firm of Mr. Beale, noticed in previous Numbers, has within the last few days been considerably relieved by the prospect that the firm will shortly be enabled to resume business. Several meetings of the inhabitants of the district have been held, at which resolutions were adopted expressive of sympathy for Mr. Beale; and a deputation has been appointed to wait on his creditors, which is expected to be attended with good effects. The working classes who have been thrown out of employ by this failure have offered to forego, in the event of business being resumed, one sixth of their wages for the next 12 months, equivalent to 1,000*l.*, in order to assist Mr. Beale in his present difficulties.

Waterford.—A few days since, a man, named Cantwell, lost his life near Carrick-on-Suir, in attempting to resist the sheriff, who was in the act of taking possession of his premises under an *habere*. It appears that the sheriff was accompanied by the constabulary of the different stations, and by a party of the 46th Reg.; as it was understood that resistance would be made. After the officer and his assistants had broken open the door of the dwelling-house, their entrance was resisted by Cantwell and his party, and in the conflict Cantwell was stabbed in the breast by one of the constabulary, and died in a few minutes. Three of his sons, who took part in the resistance to the sheriff, were brought prisoners into Carrick.

SCOTLAND.

Edinburgh.—It appears, from a return recently moved for in the House of Commons, of the official and declared value of the imports into, and the exports from, the different Scottish ports, from 1824 to the latest period at which the accounts are made up, that the total imports from 1824 to 1841 amounted to 83,429,105*l.*, and the total exports to 141,693,865*l.*, according to the official value. The total declared value of British and Irish produce and manufactures exported from Scotland during the same period amounted to 52,160,263*l.*—It is stated that the Marquis of Bute will be appointed her Majesty's Commissioner to the General Assembly of the Church of Scotland.

Stranraer.—A few days since, an accident of a serious nature, but fortunately not attended with fatal consequences, occurred to Sir Alexander and Lady Wallace. It appears that while on their way to this town in their carriage, as the coachman was in the act of drawing up opposite Cairnryan post-office, one of the reins broke, and the horses set off at full speed through the village, and along the road as far as the toll, the carriage being several times in danger of being precipitated over the side next the sea. The people of the toll had succeeded in partially shutting the gates, against which the carriage was run with great violence, whereby it was upset and broken to pieces, and Sir Alexander and Lady Wallace were thrown out on the road. The General received a severe blow on the temple, but Lady Wallace escaped without any injury.

THEATRICALS.

DRURY-LANE.—A new play, entitled "Plighted Troth," was produced at this theatre on Wednesday night. The time of the piece is towards the close of the seventeenth century, and the scene of the first act is at the castle of *Sir Gabriel Grimwood*, in Cumberland; the character of *Sir Gabriel Grimwood* being sustained by Mr. Macready. The following is a brief sketch of the plot:—*Sir Gabriel Grimwood* possesses himself of the lands and persons of his ward *Raymond Willoughby* (Mr. Anderson) and *Maddalene* (Miss H. Faucit), keeping them both in ignorance of their birthrights, and intending to marry the second ere he discovers to her that she is a Countess, and that he is, in her right, the lawful lord of her broad demesnes. The young people fall in love with each other, and make their "plighted troth." The lover then goes to seek his fortune; and ten years are now supposed to elapse. *Wormall* (Mr. Phelps) has schemed *Sir Gabriel* out of all his ill-got possessions, and becomes the successor of his former master in pride and villany. He is, in his turn, the wooer of *Maddalene*, who by this time has learnt her rank, and got possession of her estate; while *Sir Gabriel* is dwelling in poverty, in some hovel in Lambeth. *Raymond Willoughby* returns to see and woo, without recognition, her to whom his troth had been plighted on the eve of his departure. *Wormall*, in the flush of his success, is startled by the double alarm of the return of *Willoughby*, and of a threatened disclosure by *Grimwood* of the means by which *Willoughby's* property was alienated. He determines on paying a visit to *Grimwood*; and this interview brings on the catastrophe. The emergency of his own situation, and the taunts of *Grimwood*, who is inaccessible to any prospect of compromise, excite him to the assassination of the old man, who just survives to denounce his murderer. The different actors exerted themselves in the performance of their parts, and the dresses and scenery were beautiful and appropriate; but the success of the play was very equivocal, and the disapprobation expressed was but slightly qualified with applause. It was, however, announced for repetition.

Miscellaneous.

Affghan Expedition.—We copy from the "Times" of Thursday the following admirable letter from Lady Sale to her husband, which has been circulated in political circles since it reached England, and has elicited the greatest admiration of the undaunted spirit, the collected judgment, and vigorous language of the writer. "We are still," says the 'Times,' "very far from having any accurate knowledge of the terrible series of events which lasted from the 2d of November, when the insurrection broke out, to the 6th of January, when the final catastrophe of the retreat commenced. But Lady Sale is known to have preserved throughout these occurrences the same heroical firmness. Separated from her husband, when the safety of his corps must have been scarcely less doubtful than her own preservation—deprived of her gallant son-in-law, who fell in one of the passes where she herself was wounded, she carried into captivity the same spirit in which she had faced the horrors of that treacherous and wintry war; and amidst dangers in which men have lost their names and forgotten their honour, Lady Sale has earned a reputation which will be remembered as long as the dreadful scenes through which she passed.

"*Copy of a Letter from Lady Sale to General Sir Robert Sale, from Cabul, giving a Precis of Events in that City from the 2d to the 8th of November*, 1841, *and despatched on the 9th of that month.*—'My dear Sale, The last letter I had from you was dated the 1st, from Gundamuck. On the 2d, an insurrection broke out in Cabul, the shops plundered, Johnson's house and treasury looted (stripped) and burnt. He was in cantonments, his guards and servants murdered. Troup and Warburton were in cantonments, their houses burnt; Sir A. Burnes, his brother, and Broadfoot murdered; Skinner supposed to be secreted by his gomashta. Sturt was sent by the General a message, and was stabbed in four places in the King's presence—the face, the shoulder, a glance on the arm, and on the side. There are three principal chiefs at the head of this—Abdoola Khan, Atchokaye Moota Mouin, and Secunda Khan. The Kussulbashes are in, but are afraid to declare openly in our favour. Shelton, with two regiments and one company, in the Bala Hissar. On the 3d the 27th came in. They had to fight their way, being followed by 200 men, and had five killed and 15 wounded. Gordon slightly wounded. A number of Kohistanees came into Cabul. The Trevors got out of the city with just the clothes they had on their backs. Their house burnt. The Affghans attacked the cantonment and fort, but were repulsed by Waller, who was wounded by a ball, which lodged in his armpit. Another large party, who have raised the religious standard, came against the cantonments at the rear gate, where our guns dealt destruction, and the cavalry cut them up. Sturt able to speak, the wound in his shoulder deep, the side not so bad, the lungs uninjured; the face wound near the corner of the eye; he was struck on the bone with such force, that he was stunned for the moment; he had warded off two blows. On the 4th, Khan Shurreen Khan and others drove part of the fighting men out of the town. The enemy took possession of the small fort nearly opposite our bazaar that joins on the King's gardens. The guns played all day against the gate of the Shah Bagh, which is filled with the enemy; it cannot be blown open with powder, as there are too many people about it. A large party of horsemen showed themselves on the Shah Sang hill. Mahmoud Khan's fort, where the tower has been thrown down, has been taken possession of by the enemy. He is on our side, and therefore they have cut off his son's ears. We shotted and shelled the fort opposite our bazaar all day, but with little or no effect. The Kohistans up in arms and furious. Maule and Wheeler murdered; their men overpowered. Maule's khatagie (servant) alone escaped; came in half-naked this day (the 14th). Saw killed Gordon and Swayne, of the 44th. Robertson, of the 44th, and four men wounded. Walsh, Hollaken, Warren, and 16 men, 6th cavalry, wounded, 31 missing. At tea-time an alarm ; very brisk firing. 5th inst.—The troops employed all day. Guns and mortars, with shot and shell, at the fort, with very little effect. 6th inst.—Sturt insisted, weak as he was, in shirt, plasters, and pay-jumas (drawers), on going to the General (Elphinstone), as there was no engineer there but himself. We have only Warburton and Eyre as artillery-officers—no laboratory man—the General gave him leave to do what he pleased—by 10 o'clock we got all in order—by 12 a good breach, and in a few minutes it was carried—Raban killed—Deas wounded—Hobhouse and 12 of the 13th volunteered for the assault—one man badly wounded—those of the enemy who escaped were joined by a large body of horsemen, well dressed and mounted, evidently Kussulbash—Sturt says not more than 2,000, others say 3,000—a beautiful sight—Anderson's horse charged up the hill, and drove the enemy all along the crest of it to the extreme left, where the 5th cavalry charged up—they were hemmed in—more Affghan horse came up, and they had a great struggle with swords, but the Affghan matchlock was so hot, that they in turn drove ours back all along the ridge, and they had outnumbered us so greatly as to be able to retire in excellent order. Anderson's horse again went up the road to challenge them, but their position was good, and they maintained it. We had every man out on duty cantonments. A brigade was much wanted in the field. Two guns of Warburton's were seized by the enemy in the city, and the men forced to work them. They have thrown a number of balls into cantonments and into Sturt's garden from Mahmoud Khan's fort. Sir William Macnaghten has given 50,000 rupees to a Kussulbash chief, to create a diversion in our favour, and promised him two lacs if he succeeds. The Envoy and General agreed to send for the 13th and 35th (Sale's brigade)—at first the General would not ; but yesterday the order went off for you to return with the 13th and 35th, leaving your sick, wounded, and baggage in safety, to come on by long marches ; but much responsibility is thrown on you in this way, and you will have to fight great numbers near this, whatever the state of the country may be far off. The enemy have had possession of the Commissariat Fort these two days —to-day they have set it on fire, as also a village near the town that fired on them. We thought it was the city on fire. Sturt got the wall of the garden near the Commissariat Fort down by the sappers to-day. A new king and vizier had been set up, but the other chiefs will not have them. Codrington's corps in Chareekan surrounded. All the officers wounded ; Rattray and Salisbury killed. Sturt's wounds are doing well, but he overworks his strength. His mind keeps him up ; and Harcourt tells me to give him wine and arrow-root. He cannot get open his mouth to get food in properly. His tongue and throat have suffered, and all the nerves about. He is out all day, and the soldiers help him about. Last night he did not get to bed till 1, and then was waked up by a note. Mackenzie defended the fort he was in till his ammunition was expended, and then he cut his way out : has three wounds. We have intelligence that we were to be attacked to-night, and that they were making boosa bays to throw into the ditch. No one had made arrangements for an attack. The General and Anquetil gave Sturt a *carte blanche*. He has told off the officers and people to their posts, and paraded them this evening, and at 9 went with Paton, Eyre, and Pellew, all the rounds. The Envoy is in cantonments, and his place is a cavalry and infantry intrenched camp, and the walls loopholed. We have a nine and a six-pounder in the battery next us, 15 guns in position, the walls well manned, and our men stanch. If we get over to-night, we shall, I trust, repel the enemy till you arrive. Heaven shield us all! I should not be nervous if I could see what was going on. I hope they will not attack us this night ; but the unusual stillness of no firing looks like mischief. 8th inst.—We had an alarm at 4 o'clock. The enemy attempted to take the fort back again. They mined a large hole, and set fire to the bastion, but were driven back. We are all in high spirits, and look forward to your arrival with interest and anxiety.—With our united love,

" 'Florentine Sale.' "

Law.

Vice-Chancellor's Court.—*Macfadden* v. *Jenkins and Another.*—The question related to the existence of a trust. A Mr. Warry, a solicitor, and the defendant, Mr. Jenkins, also a solicitor, had been in the habit frequently of borrowing and lending money to each other, by drafts on their respective bankers, in the way of accommodation, when either of them had to make sudden or heavy advances for their clients. In the year 1840, Mr. Jenkins had borrowed of Mr. Warry a sum of 500*l.*, which it was understood was to be returned in a short period. Mr. Warry soon after was attacked by sudden illness, and being unable to write or attend to business, verbally requested a mutual professional friend to see the defendant Jenkins, and desire him to hold the 500*l.* upon trust for the plaintiff, Miss Macfadden, and to be at her disposal for her use and benefit. Mr. Jenkins accepted the trust, paying the plaintiff 10*l.* out of the sum in his hands. Mr. Warry's illness terminated fatally, and his brother, the second-named defendant, took out letters of administration. The plaintiff filed her bill, praying a declaration that the debt was owing from Mr. Jenkins, as her trustee, and praying an injunction to restrain the brother of deceased from proceeding at law against Jenkins for the 500*l.* There were affidavits on both sides ; those of the defendant, Mr. Warry, impeaching the existence of any supposed trust. His Honour said the course which the practice of the court would impose upon him would be to reserve his judgment on the facts, merely deciding on the other parts of the case. It was clear the trial of the pending action would decide nothing which could be conclusive against the plaintiff's claim in equity. It was also plain that, inasmuch as the transaction in respect of which the plaintiff claimed the debt in question was not founded upon any valuable consideration, the court would not lend its aid to protect her title, unless she showed that the transactions in the lifetime of Mr. Warry were such as would entitle her to equity. He also thought, as the deceased, Mr. Warry, had in his lifetime declared that Mr. Jenkins should be trustee for the plaintiff, it gave her an equity as against the administrator. It was quite clear upon the authorities, as an abstract proposition, that so far as related to personal property a declaration of trust might be made by parole. A declaration of trust purported to be, and in form and substance was, a transaction complete in itself, and the court need not look beyond the declaration of trust, or inquire into its origin, in order to be in a position to apply and enforce it. But in the event of any attempt to assign, the origin of the transaction must be inquired into. He felt, however, that he must, in this stage of the case, deal with the law as he had done with the facts, namely, reserve it until the hearing, without giving any opinion as to the chance of either party being ultimately successful. At all events the money itself must be brought into court.

TATTERSALL'S, Thursday.—*The Derby.*—The speculations on this event present some features of interest. The Frederica colt was again "lord of the ascendant," and from 13 to 2 up to 5 to 1 was backed with untiring energy ; the last offer was 9 to 2 only. His companion, Eleus, was at 30 to 1, nominally only, as his friends "hold hard" until the result of his race at Bath shall have transpired ; and that this seems next door to a certainty was proved by a bet of 6 to 4, and a subsequent offer of 2 to 1 on him. Of Scott's troop, Jack (the Joanna colt) and the Lord of Holderness were the principal performers :—Jack had several active supporters, with a consequent effect on the odds, and his lordship, by virtue of a small outlay and frequent inquiries, was promoted fifty per cent. on Monday's quotation. Attila had a few friends at 8 to 1, but the layers were numerous ; his position at present is not very firm. Auckland and Canadian were on the decline ; the latter, in fact, is likely to be displaced by that long-neglected favourite, Robert de Gorham, who was in favour in several quarters at an average of 22 to 1. The alterations and all that was important in the betting was confined to the horses we have specified.

The 2,000 *Guineas Stakes.*—A trifling decline in Lord Orford's colt was the only change ; Meteor was backed frequently at 2 to 1.

The Oaks betting was remarkable only for the elevation of Dil-bar to the top of the list, and for unaccepted offers of 9 to 1 agst Lord Jersey's mare. Closing prices :—

MARK LANE, Friday, April 22.—Since Monday we have been almost without any fresh arrivals of English Wheat, in the value of which, as also of free Foreign (for which latter the demand has been exceedingly limited), we observe no alteration. A few cargoes of Polish Odessa, afloat, have changed hands at 48*s.* per qr., freight and insurance included, and two or three small lots have been sold at the same price in bond for export to Belgium, but the inquiry generally is much less than last week.—Barley is difficult to dispose of, and rather cheaper.—Peas and Beans remain without alteration.—The Oat trade is slow at Monday's prices.

GAZETTE OF THE WEEK.

INSOLVENTS.—W. H. King, H. King, and D. King, of Old-street-road, Shoreditch, coach-builders—W. Wallis and J. Wallis, of Lincoln, and of Wragby, Lincolnshire, corn-merchants—J. More, Moorgate-street, City, merchant.

BANKRUPTS.—J. Simpson, Coalharbour-lane, Camberwell, licensed-victualler—A. Beuglinval and J. Farrington, Stratford, Essex, manufacturing chemists—A. Pontecorboli, Broad-street, Golden-square, oil and Italian warehouseman—J. Beagley, High-street, Camden-town, victualler—E. Smith, Lawrence-lane, Cheapside, woollen-warehouseman—S. Woods, 70, Lower Thames street, licensed victualler—J. Reed, Leeds, cloth-dresser—E. Oldham and T. Oldham, Chalford and Cheltenham, Gloucestershire, builders—W. Webber, Lincoln, tailor—G. H. St. Clair, Birmingham, pawnbroker—R. Jones, Shrewsbury, grocer—T. Worsley, Stockport, Cheshire, hosier—J. Hurley, Woburn, Bedfordshire, plumber—S. Smith, Sheffield, cutlery-manufacturer—E. Spence, Knottingley, Yorkshire, innkeeper—J. Grimshaw, Rawcliffe, Yorkshire, draper—R. Bowlby, Bishop Wearmouth, Durham, scrivener—W. Wilkinson, Manchester, dealer in toys—J. Dean, Habergham Eaves, Lancashire, cotton-spinner—J. Hilton, Tipton, Staffordshire, currier—J. Atkinson, late of Goole, but now a prisoner in the Castle, Yorkshire, joiner—P. Butler, Leamington-priors, Warwickshire, butcher—G. Guilford, North Shields, ship-owner—J. Rackham, jun., Long-acre, Middlesex, coach-builder—J. Gibson, Kingston-upon Hull, corn-merchant—R. B. Scale, Halsted, Essex, farmer—T. D. Taylor, Lower Holborn, oilman—H. Gratton, Liverpool, hatter—A. Bayley, Lothbury, stockbroker—S. Sly, Bouverie-street, Fleet-street, wood-engraver—J. Mayor, Northampton, chemist—J. Shaw, Fetter-lane, carpenter—J. Scott, Moorgate-street, railway carriage-lamp manufacturer—J. Gill, Brierly-hill, Staffordshire, iron-master—I. Marsden, jun., Bradford, Yorkshire, maltster—H. Lacey, Liverpool, bookseller—J. Richards, George-yard, Lombard street, London, metal broker—S. Hobday, Woolwich, tallow-chandler—P. Pyne, Crooked-lane Chambers, City, provision merchant—J. Lockwood, Wakefield, woollen draper.

SCOTCH SEQUESTRATIONS.—J. Newbigging, East Kilbride, Lanarkshire, wright and wood-merchant—W. Steel, late of Annathill, Lanarkshire—J. Jaffray, Barensdale, Stirlingshire, nail-manufacturer—R. Dickson, Glasgow, baker—T. Crawford, Leith, baker—J. Young, Methven, Perthshire, druggist—S. Stein, Glasgow, merchant—D. Scott and J. M. Walker, of Leith and Edinburgh, seed-crushers.

BIRTHS.—On the 18th inst., at Croxteth, the Countess of Sefton, of a son—On the 16th inst., in Eaton-place, the Viscountess Adair, of a daughter, still-born—On the 15th inst., the lady of J. Bentley, Esq., of Birch House, Lancashire, of a daughter—On the 12th inst., at Allean, Perthshire, Mrs. Unwin, of a son—On the 14th inst., at Mossley-hill, near Liverpool, the lady of A. Smith, Esq., of a daughter—On the 19th inst., at the Grove, Kentish town, Mrs. C. Shearman, of a daughter—On the [illegible] inst., Mrs. B. Watson, of Cambridge-terrace, Hyde Park, of a son—At Ulster-terrace, Regent's Park, on the 20th inst., the lady of J. C. C. Boyd, Esq., of a son.

MARRIED.—On the 5th inst., at Birmingham, Mr. G. Hoby, jun., of St. James's street, London, to Miss Hannah Barnett, of Birmingham—On the 14th inst., at Marylebone Church, Major John Smith, late Madras Cavalry, to Catherine Aurora, youngest daughter of the late R. Sherson, Esq., Madras Civil Service—On the 19th inst., at the parish church of Orsett, Essex, S. Newcome, Esq., of Orsett, to Susanna Isabella, third daughter of Mr. P. Carter, of the same place, formerly of Rainham.

DIED.—At his seat, in Bedfordshire, on the 16th inst., the Earl of Ludlow, in the [illegible] year of his age—At Naples, on the 2d inst., of fever, aged 24, E. Coleman, Esq., B.A., Trinity College, Cambridge, only son of the late Capt. E. Colman, R.N.—On the [illegible] inst., at her residence, Mount Beacon, Bath, Genevieve de Devezeau de Chasseneuil, Marquise de Rennesey, at a very advanced age—At Lower Belgrave-place, Pimlico, on the 14th inst., J. Theakston, Esq., sculptor, aged 69—On the 14th inst., at Brighton, Mrs. E. Sargeant, late of the Kent road), aged 75—On the 2d Jan., Sir Lionel Smith, Governor of the Mauritius ; and, on the 5th of the same month, Lady Smith, his wife—On the 20th inst., from injuries sustained by being thrown out of his gig, Mr. Sams, the bookseller, of St. James's-street.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By Hannah Lawrance.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly ; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25*s.* each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3*s.* 6*d.* each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2*l.* 2*s.*

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25*s.* each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S BOTANICAL HISTORY OF ROSES, with Coloured Plates, price 21*s.*

5.

DR. LINDLEY'S ACCOUNT OF THE BOTANY OF SWAN RIVER, with Coloured Plates, price 10*s.* 6*d.*

6.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS. Illustrated by Drawings on Stone, from the Sketches of Francis Bauer, Esq., F.L.S., &c. Complete in Four Parts, beautifully Coloured, price 30*s.* each.

7.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21*s.* cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured ; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen ; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators ; and on this account the present work should be in the hands of all gardeners and cultivators of plants ; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16*s.*

SWEET'S BOTANICAL CULTIVATOR ; or, Hothouse and Greenhouse Manual : giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain ; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By George Bliss, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit-trees ; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose : also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6*s.*

11.

THE FLORIST'S CULTIVATOR ; or, Plain Directions for the Management of Florists' Flowers, Shrubs, &c. ; select Lists of the most choice Flowers : to which is added the Monthly Operation usual for the Flower-garden, Shrubbery, and Greenhouse. By Thomas Willats. Price 7*s.* 6*d.* coloured and bound in cloth.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

THE following communication (translated from the German) was addressed to Messrs. Rowlands' Agent at Cologne :—

13, Straitz Euggasse, Cologne,
May 23, 1841.

Mr. Th. S. Ditges.

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For above nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial. I accordingly purchased two bottles at your establishment, and strictly followed the printed directions : in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this acknowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect.

Adam Bauer, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey ; changes Grey Hair to its original colour ; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL."

The lowest price is 3*s.* 6*d.* ; the next price is 7*s.*—10*s.* 6*d.*, and 21*s.* per bottle.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 23, 1842.

HIGH WYCOMBE HORTICULTURAL & FLORAL SOCIETY.

THE FIRST SHOW of the above Society will be held in the Town-hall, High Wycombe, on WEDNESDAY the 18th of MAY next.

J. G. TATERN,
THOS. WHEELER, } Hon. Secs.

High Wycombe, April 25, 1842.

FLOWER-SHOW.—The WEST LONDON GRAND FLORICULTURAL EXHIBITION, under the Superintendence of Mr. J. T. NEVILLE, of Peckham, will take place in the GROUNDS OF THE ALMSHOUSES of the BUTCHERS' CHARITABLE INSTITUTION, at Walham Green, Fulham, in AID of the BUILDING FUND, on WEDNESDAY 22d, and THURSDAY the 23d June, when Two Silver Cups and Twenty-three Silver Medals will be awarded. No charge to Exhibitors for Entry. Lists of the prizes will be published in a few days.

EXHIBITION OF AMERICAN PLANTS, KING'S ROAD, CHELSEA.

M. WATERER respectfully informs the Nobility and Gentry of London and its environs, that he is making every preparation, with a large addition to that of last year, for his highly-admired Exhibition of American Plants, of which due notice will be given.

NEWSOME'S PRINCESS ROYAL STRAWBERRY.

W. NEWSOME, BANK-TOP, DEWSBURY, begs to remind his Friends and the Public that he has a quantity of strong well-rooted Plants of the above superb Strawberry, 12 berries from which weighed 16 oz. Their delicious flavour is not to be surpassed; and as this is a good season for planting, an early application is desirable. Mr. Brooke, Druggist, Dewsbury, may be referred to for the weight of the fruit.

Plants, at 5*l*. per 100, may be obtained on application to the Grower; Mr. Henderson, 67, Strand, London; Mr. Girton, Nurseryman, Newark; and J. and T. Backhouse, Nurserymen, York.

ALEX. SMITH, NURSERYMAN, CIRENCESTER, begs to acquaint the Public that he is now selling at very reduced prices his stock of Greenhouse, Hardy, and other Plants. The Greenhouse Plants consist chiefly of the best varieties of Geraniums, Camellias, Heaths, Fuchsias, Cinerarias, &c. &c. Srong Plants of his Beauty of England Pansy, at 5*s*. each.

SALTHILL NURSERY, near WINDSOR.—A. J. STEWART respectfully informs the Nobility, Gentry, and the Public, that his descriptive Catalogue of new and choice Geraniums, Camellias, Fuchsias, Verbenas, Dahlias, Pansies, Calceolarias, Roses, miscellaneous Greenhouse Plants, Picotees, &c. &c., may be obtained by a prepaid application as above, and enclosing two postage stamps.

A. J. S. embraces this opportunity to apprise the cultivators of CAMELLIAS that he can furnish a few more assortments as offered by him on the 12th February in the *Gardeners' Chronicle*, excepting that Tricolor or King will be substituted for Lady Henrietta.

Good plants of Hardenbergia macrophylla, at 7s. 6d.

J. KEYNES, FLORIST, SALISBURY, begs to state that the following (with all the established Show Flowers of the Season) are now ready for delivery with his usual fine Plants. To all growers, he has no hesitation in confidently recommending them as decided improvements. *The Yellow stands at present unrivalled*, and will be indispensable to a first-rate stand. Should either of the following not prove Show Flowers, they will be deducted from accounts.

Prince of Wales (Dod's), pure yellow, most perfect shape	10*s*. 6*d*.
Twyford Perfection (Young's), puce, edged crimson .	10*s*. 6*d*.
Westbury Rival (Hall's), puce, extra fine form . .	10*s*. 6*d*.
Prince Albert (Adam's) shaded bronze, new colour .	10*s*. 6*d*.

Salisbury, April 30, 1842.

NEW AND SUPERB FUCHSIAS.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias now ready to be sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s*. per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, April 28th, 1842.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, DAHLIAS, FUCHSIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers is now ready for delivery, including Fuchsia, Conspicua arborea, raised by S. E. Prouse, Esq.; it is of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out an expanded bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Plants in May at 10*s*. 6*d*. Also two new and distinct varieties of the Verbena, from Texas—Ne Plus Ultra, a clear bright pink, with a rose coloured spot surrounding the tube, which is white; a pleasing variety; colours very much resemble those of Phlox Drummondii: Elegans, a pale pink, with a delicate rose-coloured spot surrounding the tube; plants in May, the two, at 10*s*. 6*d*. Likewise Dahlia, Lady Ann Murray, a beautiful mottled white tipped with bright rosy purple, a well-formed flower, with a fine centre, one of the most constant Dahlias grown, and desirable to the most limited grower, 3 feet, 10*s*. 6*d*.

Hans-street, Sloane-street, Chelsea.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.—WILLIAM WOOD & SON beg leave to draw the attention of Amateurs to a splendid New Seedling PETUNIA, Fielder's Magna rosea, price 3*s*. 6*d*. each; also two magnificent Seedling GERANIUMS, raised by C. W. Fox, Esq., of Truro, viz., the Princess Royal, 21*s*. each, and the Duke of Cornwall, 21*s*. each, ready for delivery early in May. For description see *Gardeners' Chronicle* of 9th April.

Plants of the above may be had at the Nursery, Maresfield; in London of Messrs. Warner and Warner, 28, Cornhill; Mr. J. Carter, 238, High Holborn; and at Tunbridge Wells of Mr. T. Cripps, Nursery. Usual discount to the Trade if three or more of the above are taken at once.

NEW FUCHSIAS, CALCEOLARIAS, AND SPANISH CHRYSANTHEMUMS.

WILLIAM MAY, in tendering his grateful acknowledgements to his numerous Floricultural Friends for their former favours, is encouraged to announce to them that his descriptive List of SIX NEW HYBRID FUCHSIAS, of distinct character, and of very improved merit to anything yet before the public,—also his six new and superb CALCEOLARIAS, which he will warrant distinct and equal (if not superior) to any yet offered, the whole being perfect in shape, of superb size, and of exquisite colours—and also his fifty new and superior CHRYSANTHEMUMS, from the South of Spain,—is now ready, and will be forwarded, on post-paid application to his Nursery, Leeming Lane, near Bedale, Yorkshire. N.B.—Strong Plants will be ready to send out early in May.

AURICULAS, GERANIUMS, CARNATIONS, PICOTEES, YELLOW PICOTEES, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment, Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine selection of the above Flowers, which he can offer at very moderate prices:—

	£. s. d.
Auriculas.	
25 Superfine Sorts, with their names, one plant of each	3 13 6
Geraniums.	
25 Superfine Sorts, with their names, one plant of each .	3 10 0
Carnations.	
12 Superfine Sorts, with their names, one pair of each .	1 15 0
Picotees.	
25 Superfine Sorts, with their names, one pair of each .	2 10 0
Yellow Picotees.	
12 Superfine Sorts, with their names, one pair of each .	2 2 0
Lilium lancifolium album, from . . .	7*s*. 6*d*. to 42*s*. each.
„ punctatum from . . .	10 6 to 42*s*. „

*** A Catalogue of Geraniums can be had on application.

GUANO MANURE.

W. SKIRVING, SEEDSMAN, QUEEN-SQUARE, LIVERPOOL, begs to announce to Landed Proprietors, and to Farmers and Gardeners, that the price of the genuine Guano has just been fixed by the importers as follows:—viz., 16*l*. per Ton for quantities under five Tons, and 15*l*. per Ton for any larger quantity.

W. S., from his experience with the Guano on various crops last year, and from the appearance of the crops of Grass at present where it was last year applied, can with confidence recommend it as a very good and, at the above price, a cheap Manure, for any garden or field crop. With this conviction, he has accepted an Agency for the Sale of the genuine Guano, and shall be happy to receive orders, which shall be promptly executed, direct from the Importer's Stores.

Terms of payment, ready money; a remittance or reference required.—Liverpool, 9th April, 1842.

JAMES MAY begs to return his sincere thanks to his numerous Friends for the very liberal encouragement he has received for his Pansies, &c. &c. It has been to him a matter of deep regret, that, in consequence of the very unfavourable season of last year, the stock of his new kinds has fallen far short of the demand; but he hopes in the course of next month (May) to complete all orders on hand for them. J. M. avails himself of this opportunity of informing his Friends and the Public, that their liberal patronage has induced him to take more extensive grounds, situated in Marsh Lane, Tottenham, which is three miles nearer to London, where his business will be carried on in future. In consequence of his removal he begs to offer fine plants of about 30 extra fine varieties of Pansies, by name, including most of last year's approved Show varieties, for 21*s*.; fine border varieties, 100 plants in 25 named kinds, for 25*s*., package included; 12 extra fine named Fuchsias, 18*s*.; 24 varieties, by name, for 25*s*., package included. A large assortment of Dahlias, including all the approved Show kinds, from 25*s*. to 30*s*. per doz.; all the approved older kinds, 9*s*. to 12*s*. per doz.; fine plants of which are now ready to be sent out.

N.B. Fine plants of that fine blooming creeper, Solanum Jasminoides, which he has proved to be perfectly hardy, 2*s*. 6*d*. per plant.

A remittance or reference is respectfully requested from unknown correspondents: the safest way of remittance is by Post-office orders, payable at the Edmonton Post-office, or General Post-office, London.—Pansy Nursery, Tottenham, April 1842.

NEW PLANTS, &c.

MESSRS. VEITCH & SON beg to offer to the Public the undernamed Plants.

Gloxinia Speciosa, var. Macrophylla Variegata. An imported plant from the Brazils, and of which a figure, &c. may be seen in the Botanical Magazine for April 1842. 2*l*. 12*s*. 6*d*. per plant.

*Begonia Coccinea, beautiful vermilion colour, from Brazil. 21*s*. per plant.

*Cycnoches Maculata, variety, 84*s*.

Stigmaphyllon Aristatum, 42*s*.

*Primula Denticulata (Hardy), from the Himalayas, fine, 10*s*. 6*d*.

Triptilion Spinosum (Hardy Perennial), from Chili, 42*s*.

NEW GERANIUMS.

Fair Maid of Devon (Veitch's). This flower was exhibited at the June exhibition at Chiswick in 1841, and pronounced by the principal Nurserymen and Amateurs to be one of the most splendid Geraniums ever seen. It is of large size and first-rate form, the upper petals beautiful bright crimson, with a distinct white margin round; the under petals light pink, with white centre. Extra fine, 63*s*. per plant.

Rose of Oxton (Swete's), raised by J. B. Swete, Esq., Oxton-house. The colour a fine bright rose, with clear white centre; fine form, abundant bloomer, and compact habit. A really good variety. 21*s*. per plant.

Mulatta (Swete's). A beautiful clouded flower, upper petals being almost black, and the under petals deep crimson. An abundant bloomer, and a striking fancy variety, but the form indifferent. 15*s*. per plant.

*** A notice of the three plants marked * may be seen by reference to Proceedings of the London Horticultural Society's meeting of the 15th of March last, when a medal was awarded them; see *Gardeners' Chronicle*, No. 12, p. 190.

Nursery, Exeter, April 20th, 1842.

A SINGLE LADY, living in the country, wishes to ENGAGE an Active, Middle-aged Married Man, without little children, as GARDENER; NOT a professed, scientific Gardener, but an industrious man, who so far knows his business as to be able to cultivate common flowers and vegetables, to raise Cucumbers, and propagate common Geraniums. He must be content with moderate wages, having in addition for himself and family a comfortable cottage on the premises, which are not large, but of which he must take the entire charge, with the occasional help of a strong well-disposed boy. His character must in all respects be such as to bear the strictest possible inquiry.

Answers, post-paid, to be directed to the care of Mrs. Hurrion, Post-office, Southborough, Tonbridge.

THOMAS CRIPPS, FLORIST, TUNBRIDGE-WELLS, respectfully informs his Friends that Plants of the New White Fuchsia "VENUS VICTRIX" will be ready the first week in May, at 21*s*. each, with the usual discount to the Trade, if three or more Plants are taken at once. For particulars see Floricultural Cabinet for March, or Gardeners' Gazette or *Chronicle* of 5th inst. Orders for this will be received by Mr. George Charlwood, 14, Tavistock-row, Covent-garden; Messrs. Cormack and Co. New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood & Son, Maresfield Nursery; or addressed as above.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE respectfully informs the Nobility, Gentry, and the Trade, that he has a few plants left of that favourite Geranium

LYNE'S CIRCASSIAN,

which has gained for itself, by every Florist who has seen it, a first-rate character. Good strong plants, in 60-sized pots, 42*s*. each.

Lyne's Consort, 21*s*. each.
„ Magnificent, 21*s*. „

Lyne's Princess Royal, and Bassett's Glory of the West, (of which W. E. K. possesses the entire stock,) cannot be sent out till about July next, in consequence of the numerous applications for it.

Veitch's Fair Maid of Devon, (just sent out,) 63*s*. each.
Pansy.—Fox's Cornish Gem, 10*s*. 6*d*. each.
Rosa Devoniensis, good strong plants, 7*s*. 6*d*. each.
Auraucaria Imbricata, in 48-sized pots, 6*s*. 6*d*. each.

W. E. R.'s General Spring Catalogue of Geraniums, Dahlias, Calceolarias, Pansies, Herbaceous Plants, &c. (which contains descriptions of the above-named plants,) can be had on prepaid application.

Agents in London: Messrs. Warner, Seedsmen, Cornhill; M.W. Bristow, Knightsbridge; through whom plants of any of the above may be procured.—Plymouth, April 25th, 1842.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 2*d*., 3*s*. 2*d*., and 4*s*. 3*d*. per yard.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

SION NURSERY, NEAR BEULAH SPA,

TO be SOLD by Private Contract, with immediate possession, comprising a Freehold Dwelling-House, Hot and Greenhouses, Pits, Boilers, &c.; with six acres of excellent Land.—Apply to Mr. Flight, 1, Adam-street, Adelphi.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to PUBLIC COMPETITION, at the Mart, Bartholomew Lane, on THURSDAY, May 5th, 1842, and following day, at 12 o'clock, a Splendid Collection of Dahlias, Geraniums, Fuchsias, Verbenas, Heartsease, Heaths, &c. May be viewed the morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

CAMELLIAS, ORANGE-TREES, &c.

A CHOICE COLLECTION TO BE DISPOSED OF by Auction, by Messrs. PROTHEROE & MORRIS, near the George, Wanstead, Essex, on MONDAY, May 9, 1842, at 11 o'clock, comprising ORANGE-TREES well furnished with Fruit, Camellias, Ericas, in great variety; Geraniums of the best assortment, and a pleasing selection of Greenhouse Plants. Catalogues may be had on the premises, and of the Auctioneers, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. T. ANSELL, jun., is instructed to submit to PUBLIC AUCTION, at the Mart, Bartholomew Lane, on Tuesday, 3rd May, 1842, at 12 o'clock, a most extensive and splendid assortment of choice DAHLIAS, embracing many of the new and leading varieties coming out this season; and about 200 of the most approved older varieties; new and choice Fuchsias, Chrysanthemums, Greenhouse Plants, Climbers, &c. &c. May be viewed the morning of sale; and Catalogues may be had at the Mart, and of the Auctioneer, Camden Nursery, Camden Town.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows :—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

OILS, COLOURS, VARNISHES, &c.—Best Ground White Lead, 30s. per cwt.; 2nd, 28s.; 3rd, 24s. Linseed Oil, 3s. per Gallon; Turps, 4s. 9d.; Dry or Ground Brunswick Green, from 4½d. to 1s. per lb.; Invisible Green, for Rough Work, 30s. per cwt.; Stone colour, 34s.; Celestial Blue, 6d. per lb.; Quick-drying Carriage Varnish, 14s. per gallon; French Polish and Spirit Varnishes, 20s.; Naphtha do., 11s. 6d.; Burning Naphtha without smell, 6s. 6d. per gallon; Best Stockholm Tar, 21s. per barrel; Coal do., 10s. 6d. do.

Every description of Colour Brushes, &c., of the best quality, at the lowest prices for cash, at Nixey's, 22, Moor-street, Soho.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing, upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass, supplied in any number or quantity, at wholesale prices.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES—Green, 1*s.* per lb.; White, 1*s.* 2*d.* per lb.; or from 2*s.* 6*d.* to 24*s.* per dozen. Cucumber Tubes, all lengths, from 6*d.* to 4*s.* each. Grape Shades, from 2*s.* 6*d.* each. Irish Globes, from 1*s.* 6*d.* each; ditto for Fountains, with solid bottom and hole, 2*s.* 6*d.* per lb.—APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars, where every description of Table Glass China is on show. Days for viewing the Works—Tuesday, Wednesday, and Thursday.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

IMPORTANT WORKS ON BOTANY AND GARDENING, published by Ridgway, Piccadilly; and to be had, by order, of every country Bookseller.

1.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols., beautifully coloured, price 25*s.* each.

2.

DR. LINDLEY'S BOTANICAL REGISTER. Published monthly, price 3*s.* 6*d.* each Number, containing Drawings from Nature of the newest and most beautiful Plants, with Directions for Cultivation, &c. &c. The volume for 1841 is now ready, price 2*l.* 2*s.*

"The Botanical Register, from containing most or all the new Plants introduced by the Horticultural Society, from the great care with which its plates are executed, and the judicious remarks on culture and general habit, by Dr. Lindley, is, in consequence, the superior publication."—*Loudon's Magazine of Botany, &c.*

"Too much praise cannot be bestowed upon this work."—*Horticultural Cabinet.*

3.

DR. LINDLEY'S SERTUM ORCHIDACEUM. A Wreath of the most beautiful Orchidaceous Flowers, in Ten Parts, price 25*s.* each. This splendid work is now complete, the Tenth Part being just published.

4.

DR. LINDLEY'S GENERA AND SPECIES OF ORCHIDEOUS PLANTS, in 8vo, in Seven Parts, is now complete; and Subscribers are respectfully requested to make up their sets as soon as possible, several of the early Numbers being nearly out of print.

8.

DON'S EDITION OF SWEET'S CATALOGUE OF PLANTS, corrected to the present time, without Supplements. Price 21*s.* cloth boards, arranged.

"It certainly is the most complete and useful Catalogue that has yet appeared, as, in one line, it gives the systematic and English names, where described, of what country it is a native, the year introduced, the months when in flower, whether hardy or tender, its duration, and reference to the books in which it is figured; and where any names have been lately changed, a synonym is given in Italics, to show what it is changed from. It also contains nearly double the number of Plants contained in any other Catalogue that we have seen; so that, on the whole, we believe it could not have been more complete. In our opinion, the arrangement according to the natural system is far preferable to that of an artificial one, particularly for cultivators; and on this account the present work should be in the hands of all gardeners and cultivators of plants; and the reference to the figures will also render it very useful to the botanist.—*Gentleman's Magazine.*

9.

Sixth Edition, in one large vol. 8vo, price 16*s.*

SWEET'S BOTANICAL CULTIVATOR; or, Hothouse and Greenhouse Manual: giving full Practical Instructions for the Management of all the Plants cultivated in the Hothouses, Greenhouses, Frames, and Borders, in the Gardens of Great Britain; with Plain Directions for the Management of Bulbs and Plants in Rooms, &c.

"Indeed what Mr. Sweet has said on the Culture of Bulbs and Epiphytes, in the last Edition of his Botanical Cultivator, may be considered as the *ultimatum* on this subject for the British Gardener."—*Gardener's Magazine.*

This Edition corresponds with the New Edition of Sweet's Hortus Britannicus, and contains for the first time, Genus Orchidaceæ.

10.

THE FRUIT-GROWER'S INSTRUCTOR. By GEORGE BLISS, Nurseryman. Containing full Directions for Planting and Cultivating of Fruit-trees; with Instructions for Forcing, and Lists of the best kinds of Fruit for every purpose: also Directions for Hothouse Building, and the most Improved Modes of Heating. Second Edition, enlarged, price 6*s.*

11.

THE FLORIST'S CULTIVATOR; or, Plain Directions for the Management of Florists' Flowers, Shrubs, &c.; select Lists of the most choice Flowers: to which is added the Monthly Operation usual for the Flower-garden, Shrubbery, and Greenhouse. By THOMAS WILLATS. Price 7*s.* 6*d*, coloured and bound in cloth.

THE ALPACA.

WANTED a PAIR of the ALPACA. Particulars and Price to be sent to the Office of this Paper.

WANTS a SITUATION as GARDENER, a Married Man, who can produce satisfactory testimonials as to ability and character from the situation he is about leaving. Letters to be addressed to J. S., at Mr. Ansell's, Camden Nursery, Camden Town.

WANTS a SITUATION, as UNDER GARDENER, a Young Man of good character, who has been accustomed to the Nursery business for the last six years.—Address W. B., 19, Harmood-street, Hampstead-road.

WANTS a SITUATION as GARDENER, a Young Man who thoroughly understands his profession in all its various departments.—Direct A. B., at Mr. Davis's Coffee-house, Queen-street, Seymour place, London.

WANTS a SITUATION as FOREMAN, a Young Man, aged 26, who has been accustomed to Plants generally, but more particularly Geraniums, Calceolarias, and Florist Flowers. Respectable references will be given. Address, p.-paid, to B. M., care of Messrs. T. & C. Lockhart, 156 Cheapside.

WANTS a SITUATION, as GARDENER, a Middle-aged Single Man, who has a thorough knowledge of his business in all its branches. Can have a good character for industry, &c. High wages not so much his object as a respectable place.—For further particulars address R. S., Post-office, Cuckfield, Sussex.

WANTS a SITUATION, as GARDENER, a Single Young Man; understands his business in all its branches; no objection to any part of the country; can give good reference for character to places where he has lived.—Apply, post-paid, to Mr. Pratt, Draper, Mitcham, Surrey.

WANTS a Situation as GARDENER, a steady, active Young Man, about 30 years of age, who possesses a thorough practical knowledge of his business in all its different branches, and can be highly recommended for honesty, sobriety, and attention. Direct to J. E., at the Office of this Paper.

WANTS a SITUATION as GARDENER, or GARDENER and FORESTER, a Married Man, aged 33, who has lived in some of the most extensive Gardens in England. Can be highly recommended by the Gentleman he has just left, as also by some of the first Horticulturists of the day. Address Y.Z., P. Newman's, Hosier, 107, Quadrant, Regent-street.

WANTS a SITUATION as GARDENER, a Middle aged Man, who thoroughly understands his business, and has had extensive practice for the last 20 years: would not object to superintend Meadow Land, and would live in or out of the house; can have five years' good character from his last place. Address B. C., Mr. Fryer's, Seedsman and Florist, Camberwell New Road.

WANTS a SITUATION as GARDENER, or Gardener and Forester, a Married Man, aged 30 years, and without a Family. He has a thorough knowledge of Gardening in all its branches, and has lived as Gardener in very respectable situations. Can have a 4½ years' character from the relict of his late Employer.—Salary 60*l.* per annum, cottage, &c.—Address H. M., at the *Gardeners' Chronicle* Office, 3, Charles-street, Covent-garden.

WANTS a SITUATION as GARDENER, F. GOODALL, several years gardener to R. Wilbraham, Esq., of Rode Hall, Cheshire. The advertiser has had much experience in the various branches of his business, and understands the modern system of gardening. He is a married man, with no family, and can have a good character from his late employer. Letters addressed to F. Goodall, No. 6, George-place, South-street, Camberwell, Surrey, will be duly attended to.

WANTS a SITUATION as GARDENER, or GARDENER and STEWARD.—JAMES FINLAY, upwards of five years Gardener and Steward to the Right Hon. Viscount Beresford, at Bedgebury Park, is now disengaged, and wishes to meet with another situation. Bedgebury Mansion having been rebuilt and enlarged, the Pleasure-Grounds and Kitchen-Gardens have been entirely remodelled and greatly extended; and Pines, Grapes, and Peaches, &c., cultivated with success. There being many miles of roads and drives formed and completed, and the Woodlands and Farm being extensive, and much improved by planting, draining, &c., J. F. has had an opportunity of gaining a general and practical knowledge of estate-work. J. F. is in the prime of life, is married, and will be highly recommended by his late employer. Address J. Finlay, at the Office of thjs Paper.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER, G. H. NIEMAN, Gardener to the Venerable Archdeacon Berners, whom he is now about leaving. He is competent to undertake the management of a Situation where Gardening is carried on to the greatest extent; of which he has given repeated proofs at the London Horticultural Exhibition, when living with the late P. C. Labouchere, Esq., of Hylands, in Essex, his former employer. The following are a few of the Fruits and Vegetables G. H. N. has been in the habit of forcing:—Grapes, Pines, Peaches, Apricots, Figs, Raspberries, &c. &c.; Lettuces all the winter months, as well as French Beans, Cauliflowers, and young Carrots: all of which he has given proof of at the different Horticultural Exhibitions. Any Nobleman or Gentleman requiring a confidential servant will not find himself disappointed in the Advertiser, who is a married man, aged 39, without incumbrance.—Address, G. H. Nieman, Wolverstone Park, Ipswich, Suffolk.

BINGLEY'S USEFUL KNOWLEDGE.—SIXTH EDITION. In 2 vols. 12mo, (with 150 new Illustrations,) price 16*s.* cloth lettered.

USEFUL KNOWLEDGE; or, A FAMILIAR ACCOUNT of the VARIOUS PRODUCTIONS of NATURE. By the Rev. WILLIAM BINGLEY, M.A., F.L.S., Author of "Animal Biography." This edition has been thoroughly revised, enlarged, and adapted to the present state of science, by Mr. DANIEL COOPER, Associate of the Linnæan Society, and late of the British Museum. It forms a Text-Book of Mineralogy, Botany, and Zoology, and a Manual of general Reference, describing the various Natural Productions employed either as the Food of Man or in the Arts and Manufactures.

London: Rivingtons; Longman and Co.; Harvey and Darton; Baldwin and Cradock; Whittaker and Co.; Simpkin, Marshall, and Co.; and C. Dolman.

Just published, No. V., price 2s. 6d.,

THE LADIES' FLOWER-GARDEN of ORNAMENTAL PERENNIALS. By Mrs. LOUDON. Each Number contains Three Plates, demy 4to size, comprising from Fifteen to Twenty Figures accurately coloured from Nature.

Also, just published,

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL ANNUALS. 48 Plates. Cloth, price 2*l.* 2*s.*

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL BULBOUS PLANTS. 58 Plates. Cloth, price 2*l.* 12*s.* 6*d.*

London: published by William Smith, 113, Fleet-street.

HORTICULTURAL SOCIETY OF LONDON.

MR. SOLLY'S NEXT LECTURE ON THE CHEMICAL PRINCIPLES WHICH REGULATE THE GROWTH OF PLANTS AND PROCESSES OF VEGETATION, will be given on Friday next, at 3 P.M.

Tickets for these Lectures are issued gratis exclusively to Fellows of the Society, upon application to the Secretary.

The Gardeners' Chronicle.

SATURDAY, APRIL 30, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	Horticultural Anniversary	1 P.M.
	Entomological	8 P.M.
Tuesday	Horticultural	8 P.M.
	Linnean	8 P.M.
	Floricultural	7 P.M.
Wednesday	Geological	8½ P.M.
Friday	Botanical	8 P.M.

LOCAL MEETING.—May 3d, Annual Meeting of Royal Berkshire Horticultural Society.

YESTERDAY Mr. Solly delivered his first lecture to the Fellows of the Horticultural Society and their friends, upon the connexion between chemistry and the arts of cultivation. We cannot speak too highly of the manner in which the very difficult task of compressing much matter into a small space, and of selecting those topics only which have a direct connexion with the subject, was executed, nor, indeed, of the whole management of the discourse. From the attention with which the lecture was received, it was evident that those who were present entertained the same opinion as ourselves. We confess it gives us great satisfaction to find that the Horticultural Society should be the first of the great bodies of London to take a decided step towards connecting chemical science with the practical operations of the gardener, by means of public lectures at the present day.

For the heads of Mr. Solly's lecture, we refer our readers to the Proceedings of the Horticultural Society, in which a very short abstract of it is given.

THERE are some fastidious critics who disapprove of our occupying so much space with information concerning manures, and who would have us leave all such questions to the investigation of persons immediately concerned in them. This is practically demanding that they should not be investigated at all, as is proved by every one's experience. Interested persons have, in fact, been thus left to themselves, till within a few years; and what has been the consequence, except that a very large proportion of the elements out of which our food is re-constructed by the vegetable kingdom is utterly wasted? *It is no exaggeration to say, that in London alone this waste amounts annually to as much as a million quarters of corn.*

We will only beg our readers to look at the condition of the farmer on the one side, and of the labourer on the other, and to tell us what hope there is for the prosperity of either without a very considerable increase in the productiveness of land; or, turning their eyes in another direction, to say how the cultivation of garden produce is now likely to be much improved without some more powerful means than we at present possess of stimulating plants into healthy growth. In our opinion, then, it is our duty to keep this most important subject continually before the public by whatever means we may possess.

The waste of manure arises partly from not knowing what constitutes this substance, and partly from the false idea, that it is useless to economise that which is so plentiful; for everybody feels the paramount importance of some manure to the cultivator. The skill with which several eminent chemists have simplified their explanation of its properties ought indeed to have made the matter clearer; the more especially, since, of late years, they have employed familiar instead of technical language in their discoveries. But we fear that the very circumstance of their having connected it with chemical considerations has in itself prevented their being listened to with attention by the mass of mankind. We shall therefore endeavour to obtain the ear of our agricultural friends, by divesting such observations as we may from time to time address to them of everything like a scientific dress.

Men are too much accustomed to suppose that certain well-known substances alone form manure, and to exclude from the idea of manure all other substances. This is *one* of our most essential errors. The truth is, that every kind of substance, no matter what it may be, which has been at any time whatever organised, will form manure. By the word organised, or organic, is meant that which belongs or has belonged to a plant or an animal. The world, however, practically supposes that those substances only are manure which readily become putrid and offensive, and that those others which do not quickly decay are not manures at all. Of the latter, a vast quantity is continually lost. Such, for instance, are hair, horn, the parings of hoofs, paper, shavings, saw-dust, old linen, cordage, tan, feathers, skins, soap-suds, grease, and a variety of other matters, to which, until lately, might have been added bones. All such refuse will decay sooner or later, and in decay become manure; with some it may be hastened by artificial contrivances,—with others, burning is the most ready mode of preparing them.

Both plants and animals are composed of viewless substances condensed from the air. By mysterious processes, which we cannot see, nature forms them by slow degrees; each feeds on the other, and in the process of feeding adds to itself a portion of its food converted into a new shape. Of every portion of air we inhale, of all the liquids we drink, and of every particle which we swallow, something is seized by us and added to our bodies, not in the form of air or liquid, but of new and living matter. And so it also is with plants, which, although destitute of mouths, nevertheless suck up into their interior liquid and air-like substances, and thereon feed and increase their bulk. Our nutriment consists of pure and undecayed materials; for their food, plants select the same materials in a state of decay; and thus, by the wonderful and wise economy of nature, the air we breathe is preserved in purity by the never-ceasing agency of the verdure that clothes the earth. If it were otherwise, we should be surrounded by loathsome objects; the air would be oppressed by putrid exhalations, and pestilence would speedily depopulate the land. Plants prevent this; to use a homely but true expression, they are "the scavengers of nature," and we owe to them all that is fair and pleasant in the scenes before us.

If a dead animal is laid upon the surface of the ground and watched, certain well-known changes take place. At first it will distend, and putrid exhalations will arise; this is caused by a part of the animal flying away in the form of offensive air, and that part the atmosphere receives. Then rain will fall upon it, and dissolve other parts which run down into the soil, and add something to the earth. At last it will dry up and shrink; but that drying up and shrinking—that becoming smaller—is because other portions take their departure from it by slower and more insensible degrees; for all that was solid changes in time to matter that can neither be touched nor seen. In the end, everything will have disappeared—the flesh, the hide, and, at last, the bones; those having lasted longest which were originally hardest. Only a few years have elapsed, and what has become of all the bodies that strewed the field of Waterloo? Not a trace remains of them. Through such changes as have been just described, they all have passed till not even the bones remain to tell the tale of their destruction. They are not, however, lost; exactly as much matter as the world contained on the morning of that 18th of June it contains now; but the charging squadrons are transformed to the corn that waves above the plains of Flanders, to the peasants that till them, to the cattle that they have reared, and to a thousand other peaceful shapes.

In this manner the same materials are from day to day converted from one thing into another. Man dies, decays, and his elements are set free to be taken up into the body of a fruit or a grain of corn. The fruit ripens, the grain is converted into bread, man eats it, and thus recovers a part of what his predecessor had lost: so that, in reality, the doctrine of metempsychosis was scarcely a delusion; for a transmigration of souls, if by that name was meant the elements of life, is incessantly in action.

Without a right understanding of these curious facts, what really constitutes manure can hardly be understood; if they are justly appreciated, the subject is stripped of all that makes it strange and incomprehensible.

AN article upon the cultivation of Asparagus in Guipuscoa, which appeared in our columns a few weeks since, has attracted considerable attention, and, we have reason to believe, will lead to a general improvement in the cultivation of this invaluable vegetable. One objection only has been taken to the Spanish method, and that relates to the kind of manure which the St. Sebastian gardeners employ. When, however, it is recollected that many months intervene between the application of manure to the beds and the cutting the Asparagus, and that in the course of this time the whole nature of the manure is changed, this objection seems to us of no weight. Besides, it equally applies to all manures, and is at once obviated if the proper means are taken, as they always should be, to deprive the manuring substances of their offensive quality.

In the remarks we made in the place thus alluded to, we confined ourselves to pointing out the manner in which the beds of Asparagus should be prepared and manured. Another not less important point remains for consideration, namely, the treatment of the plants.

You cannot have fruit without leaves; and the more abundant the leaves are, provided they are all fully exposed to light and air, the larger and more excellent will be a crop of fruit, within certain limits. This truth we have frequently impressed upon our readers. But if it is true of fruit within certain limits, it is absolutely true of sprouts, such as those which the Asparagus plant produces; and the reverse of the proposition is equally unexceptionable: that is to say, the fewer leaves are left upon a plant, the more feeble will be its sprouts. To push the illustration to its utmost limits, we may add that the destruction of the leaves is eventually the destruction of the plant.

Those thread-like bodies which clothe the stems of the Asparagus in summer-time act as its leaves, and are incessantly engaged in robbing air and earth of the matter out of which future sprouts are to be formed. That matter the stems convey down into the roots, where it is stored up till it is wanted. The more stems clothed with leaves, the more of such matter, and, consequently, the stronger the sprouts in the succeeding season; and *vice versâ*. If the summer shoots of Asparagus are strong, it is impossible that the sprouts should be weak; if the summer shoots are weak, it is impossible that the sprouts should be strong.

These are facts about which there can be no mistake; but we fear they are far from being always sufficiently considered. We know very well that in practice gardeners will continue to cut sprout after sprout of Asparagus, until the roots are so much weakened, that the latter shoots, which are allowed to grow, are thin, feeble, and evidently struggling with exhaustion. Such debilitated shoots can do little for the roots during the summer; they can barely maintain their own existence, and are, consequently, preparing no new matter out of which sprouts can be formed the succeeding spring, when the crop is therefore necessarily weak and worthless.

The conclusion to be drawn from this is obvious. No one should cut too many sprouts from his Asparagus beds; no one should remove limb after limb of his plants, until they produce nothing but what is too small for table. On the contrary, the gardener should take care to leave at least two or three strong sprouts to grow from every root; or, what is better, his beds should be rested one year, and cut another; for he may be certain, from the strength of the summer shoots, what sort of sprouts he will have to cut the succeeding year—remembering always that it is useless to manure Asparagus beds for sprouts independently of summer shoots. If a bed of Asparagus is weak, manure in the autumn will do but little for making it bring strong sprouts the next season. All that the manure can then do is to feed abundantly the summer shoots of the succeeding summer, and so enable them to prepare plenty of materials out of which a second season's strong sprouts may be pushed forth.

What is true of Asparagus is equally true of Seakale and Rhubarb.

WE are happy to find the Auricula resuming its station as a favourite with amateurs, and becoming, as it well deserves to be, more generally grown. The renewed popularity of this beautiful flower may, in a great measure, be attributed to the simplicity of its present mode of culture; the mystery and quackery which attended its management by the old growers being swept away, along with the stimulating manures they recommended; and an easy mode of cultivation pointed out, so as to bring it within the means of any one. This alteration is a great boon to the amateur, who was frequently deterred from indulging his taste for its cultivation by the obstacles that he was led to anticipate. Dr. Horner's admirable paper upon the subject in our columns (p. 296, 1841,) has done much good in this way. His experience is decidedly in favour of a simple compost, to be easily procured, and he cautions growers against rank manures, which no doubt endanger the general health of the plants. Mr. Dickson, also, well known in the neighbourhood of London as a successful grower of the Auricula, uses a soil somewhat similar, composed of one-third Norwood loam, one-third peat and leaf mould in equal quantities, and one-third rotten dung. These statements in favour of a simple compost by eminent florists give encouragement to beginners, and dispel the doubts of the timid, who, although anxious to enter upon the cultivation of a favourite flower, may be nevertheless reluctant to encounter what was very likely to prove almost certain failure.

The properties of the Auricula have been given in a former Number (p. 228, 1841,) and were accompanied by figures to illustrate the different points. The discussions upon this subject which have lately occupied the attention of the Floricultural Society (an account of which will be found in our report of their proceedings) have confirmed the accuracy of the properties we then laid down. Some difference, indeed, of opinion existed as to the division of the pip into equal parts, some contending that this division gave too little paste; but it must always be borne in mind, that if the paste is of good quality, that is to say, dense and pure, it will always maintain its ascendency, from the known fact that white objects reflect the rays of light, whereas they are absorbed by the coloured rings. We think that any one who will be at the trouble of examining diagrams of the Auricula, where the pip is divided into equal and unequal proportions will at once acknowledge the superiority of an equal division of the circles.

From the unusual number of new varieties which have been exhibited this season, it is evident that a fresh stimulus has been given to the cultivation of the Auricula; and we hail the fine display of seedlings at the rooms of the Floricultural Society, on Tuesday last, as the best possible omen for the future.

AZALEA INDICA.

Few plants better repay the care of the cultivator than the Azálea indica and its varieties, in ornamenting either the greenhouse or conservatory with their splendid and odoriferous flowers; and, from the facility with which they are forced, they may be had in bloom from January to the latter end of June.

The soil best adapted for their growth is a peaty earth, found on commons where heath abounds, of a light fibrous texture, and containing a good portion of sand: it should be pared off from 3 in. to 4 in. deep: the turves should be spread bottom upwards, and exposed to the sun during summer; and, after having a few showers of rain upon it, to restore it to a proper degree of moisture, it may be laid up in narrow ridges in the autumn: it can then be taken to the potting-shed as required. When used, it should be broken or separated with a trowel, and not sifted, rejecting the undecayed surface; and for the strong-growing varieties, to six-eighths of peat add one-eighth loam and one-eighth silver-sand.

In choosing plants of the Indian Azálea, those which are young and healthy should be selected in preference to large ones: indeed, such is the desire to possess the new varieties, that fine specimens are hardly to be obtained.

About the beginning of March, those which are intended for specimens should be put into a house at a temperature of from 45° to 55°, where they will soon be excited to grow. If in 60 or 48 sized pots, they should be shifted into sizes larger; but it is better to do this when the plants are in a growing state. They should then be shaded for a few days, and when the flower is shut up in the afternoon, gently syringed. Many varieties will throw up three or four stems: the strongest should be selected for a leader, the others stopped at different lengths, to keep the plants bushy at the bottom; and when the leader itself is disposed to grow a great length without making branches, it should be stopped likewise; which will cause it to throw out lateral branches, one of which should be chosen for the leader. When growing, they should have plenty of air and light, without being exposed to a cold current, which is so frequently prejudicial to young plants in the spring, when clear sunshine and cold winds prevail. As they will be required to grow as late in the autumn as the weather will permit without applying fire-heat, and as it is not desirable that they should form flower-buds this season, those which want pot-room should be again shifted about the latter end of July. Great care should be taken that they are not over-potted, and that they have sufficient drainage; elevating the collar of the stem considerably, by rounding the upper side of the ball, but not so as to injure the tender and delicate fibres. The Azálea is liable to canker, from the water remaining too long about the collar; therefore, in watering, the spout of the pot should never be applied to it, as the cold current of water frequently repeated will check the flow of sap, and ultimately cause death. They should be placed at the back of the greenhouse during the winter; as near the glass as convenient, to ripen the wood. In the following spring they should be subjected to the same treatment, and again shifted into larger pots. About the latter end of July they should be placed out of doors, in a situation where they will have the afternoon sun, free from the drip of trees and protected from high winds. The plants will now be of sufficient size to bloom, and in September will have formed their flower-buds. When out of doors, they should be occasionally syringed overhead in very dry weather, and the ground around them frequently stirred and watered.

The Indian Azáleas ripen their seed in February, which should be sown about the beginning of March, in pots with ample drainage, and a larger portion of silver-sand mixed with the peat. The pot should be filled to within half-an-inch of the top, and pressed evenly and firmly down with the bottom of another. The seed should then be sown regularly over the surface, and after being covered sufficiently deep with peat, again pressed down, so that, after being watered, the seed may remain buried. The pots should be placed on a shelf in the greenhouse, and shaded from the direct rays of the sun. It is better that the seeds should vegetate by the increasing heat of the spring than by artificial means, since they will come up stronger, and are not so liable to damp off. They may be pricked out into other pots as soon as they have made two or three leaves, and, as they advance in growth, they may be potted into thumbs or small 60s, in which they may remain all the winter. Their treatment afterwards will be the same as was stated for cuttings.

When convenient, it is better to keep the specimen Azáleas in a house by themselves—for instance, in a late vinery, which it is desirable to keep cool and airy, with sufficient heat in the winter to exclude frost.

About the middle of December, two or three varieties should be put into a forcing-house, ranging from 50° to 65°: these will begin to bloom about the latter end of January, after which they should be removed to the greenhouse or conservatory, to which they will give much brilliancy, and in mild weather impart a mild perfume. About a week before the first have expanded their blossoms, another succession should be put in, selecting those which, from the enlargement of their buds, give evidence of their susceptibility of excitement; observing that the more various the colour of the flowers, the better effect will be produced in the greenhouse. It is a safe rule to keep up for a succession three or four varieties, to be put into heat, as above stated, once a month, until the season is so far advanced that the flowers are bursting in the cool house. They should then be taken into heat, by which means the flowers will be larger, the colours more brilliant, and their fragrance more delightful. Every means should be adopted to prevent the attacks of the humble-bee, as every blossom in which it inserts its proboscis will fall off in a few hours afterwards.

When the large specimen plants have done flowering, all the seed-vessels should be picked off, leaving such as are intended for seed. They should be then shifted, and encouraged to grow, afterwards placing them out of doors, as before stated. Great care should be taken at all times to keep them clean and free from insects, as they are liable to be attacked by a species of thrips, for which the best remedy is a strong fumigation of tobacco. The varieties Variegata and Lateritia are early excited in the spring, but are, nevertheless, the latest bloomers: they will make finer and stronger specimens by being inarched on the more robust sorts.

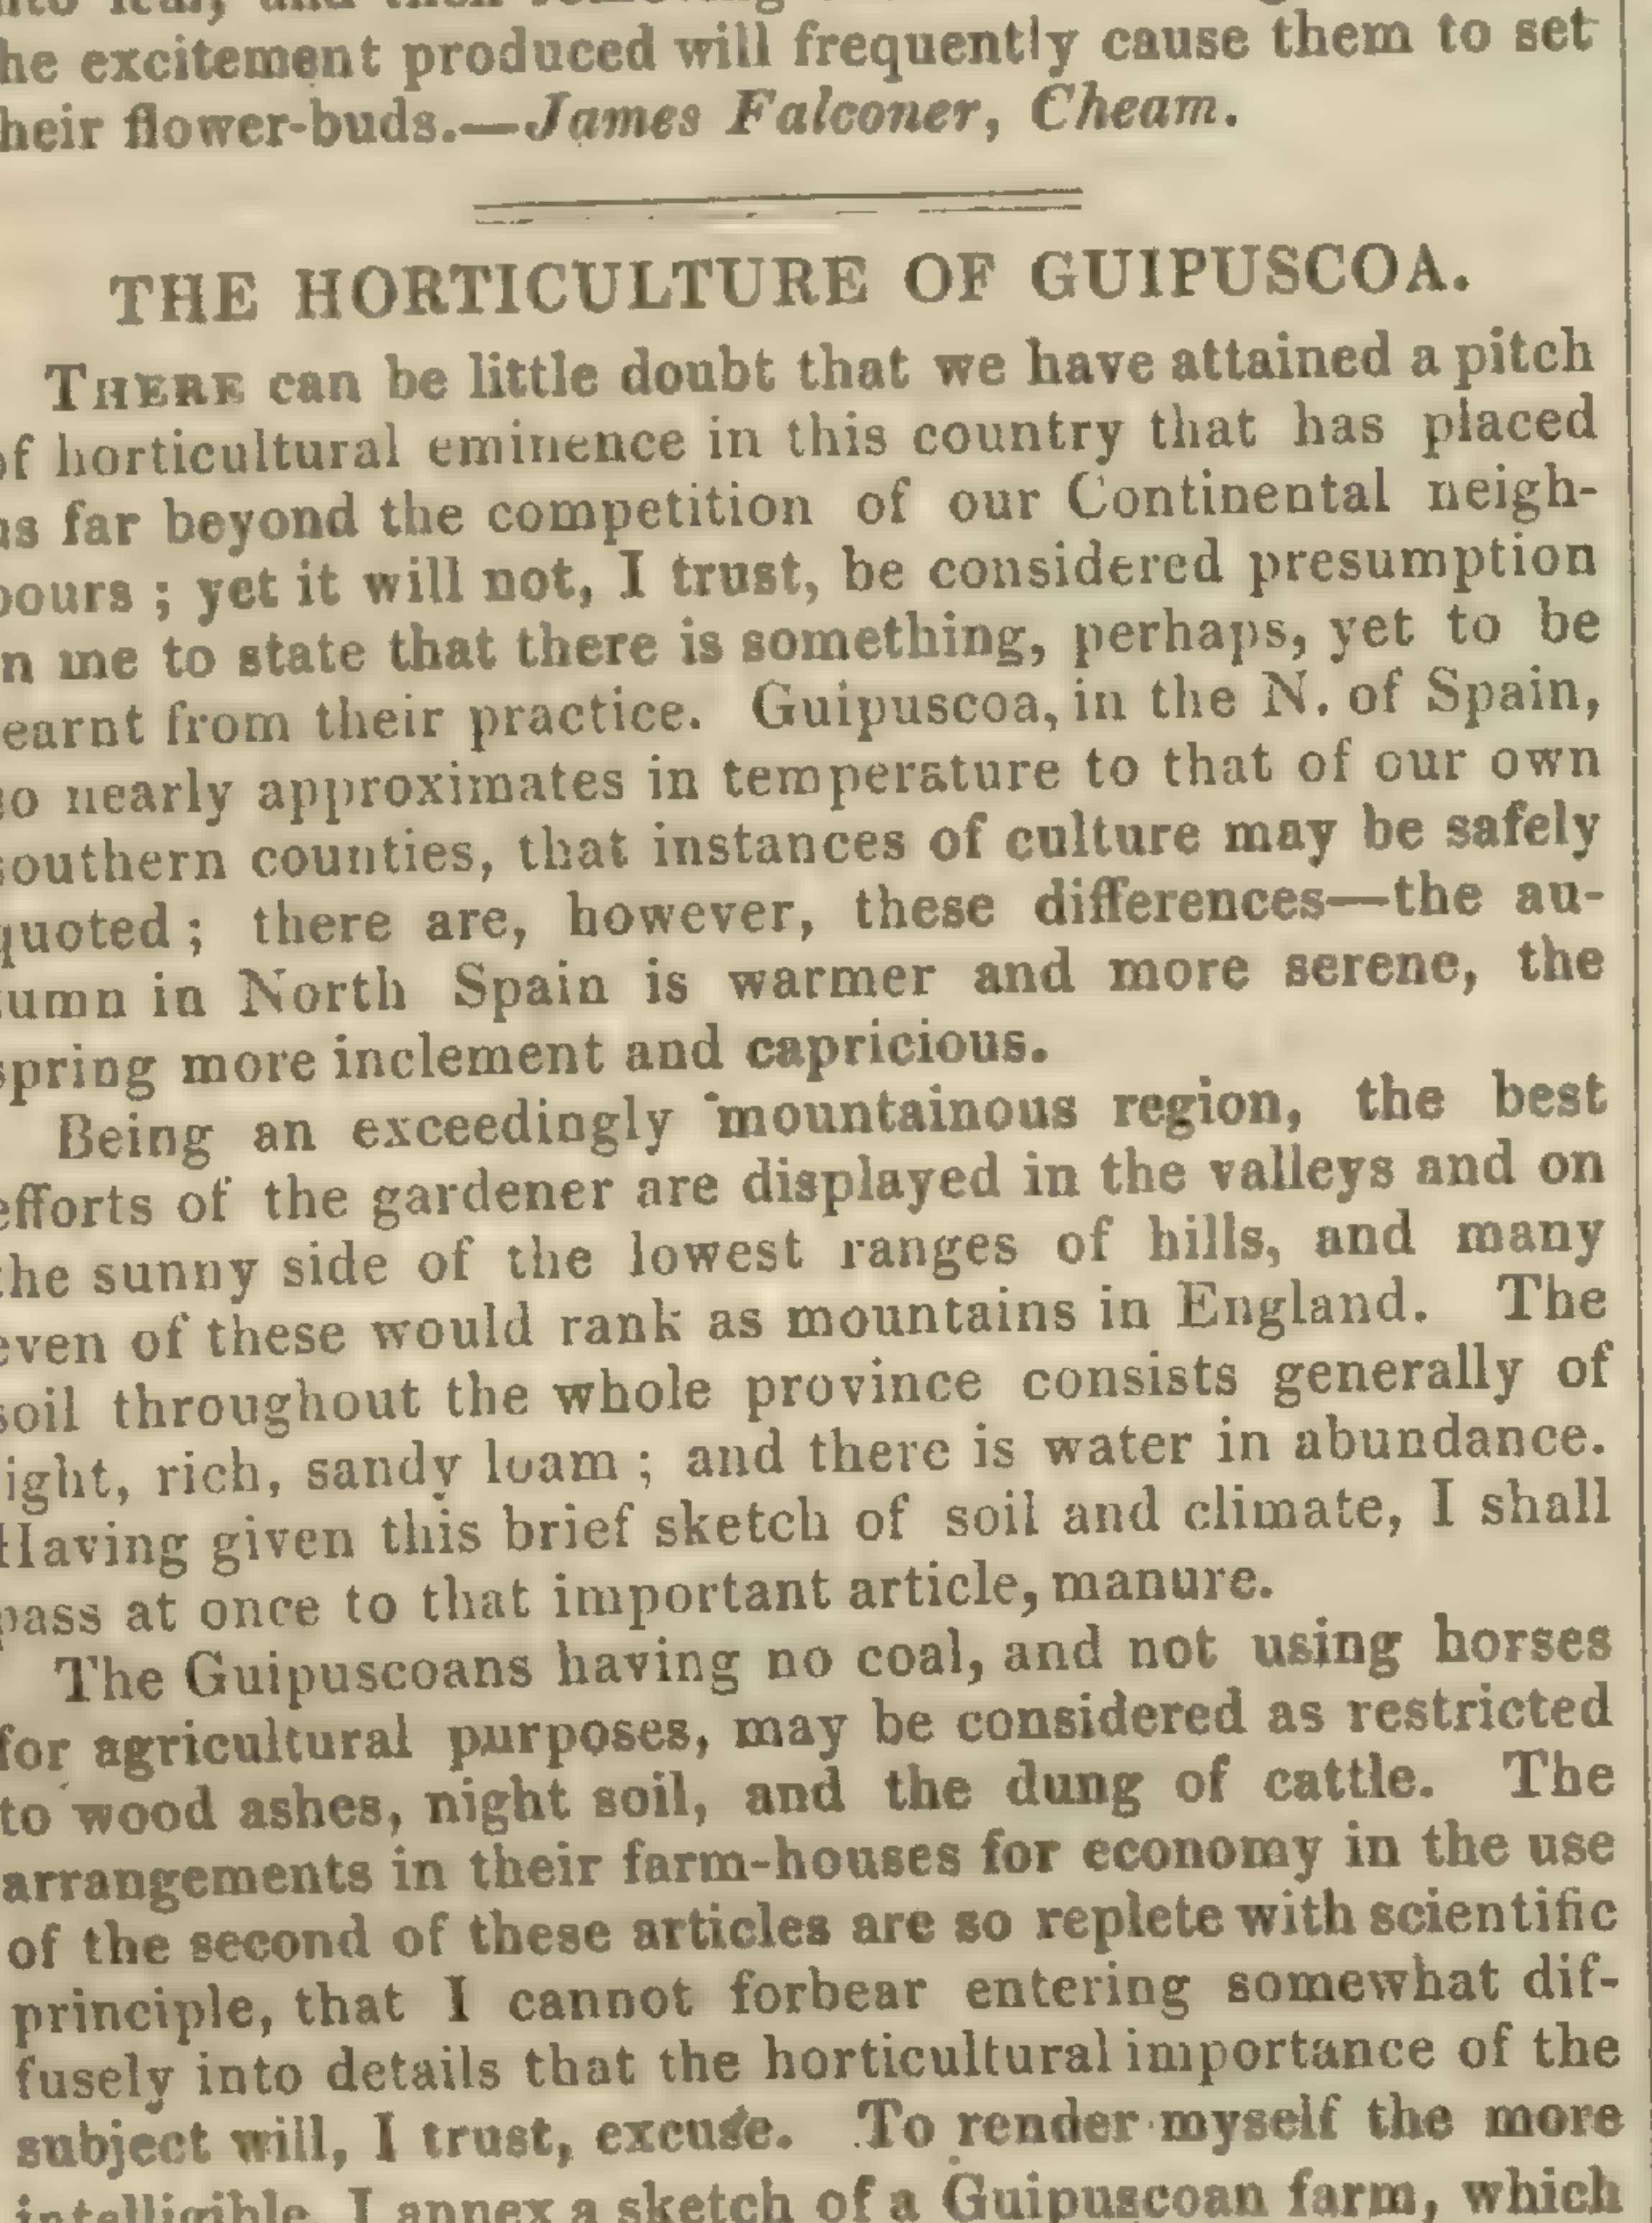
If, after they have made their autumnal growth, they should not have formed flower-buds, by placing them in a stove, in a strong moist heat, until they have again burst into leaf, and then removing them to a cold greenhouse, the excitement produced will frequently cause them to set their flower-buds.—*James Falconer, Cheam.*

THE HORTICULTURE OF GUIPUSCOA.

There can be little doubt that we have attained a pitch of horticultural eminence in this country that has placed us far beyond the competition of our Continental neighbours; yet it will not, I trust, be considered presumption in me to state that there is something, perhaps, yet to be learnt from their practice. Guipuscoa, in the N. of Spain, so nearly approximates in temperature to that of our own southern counties, that instances of culture may be safely quoted; there are, however, these differences—the autumn in North Spain is warmer and more serene, the spring more inclement and capricious.

Being an exceedingly mountainous region, the best efforts of the gardener are displayed in the valleys and on the sunny side of the lowest ranges of hills, and many even of these would rank as mountains in England. The soil throughout the whole province consists generally of light, rich, sandy loam; and there is water in abundance. Having given this brief sketch of soil and climate, I shall pass at once to that important article, manure.

The Guipuscoans having no coal, and not using horses for agricultural purposes, may be considered as restricted to wood ashes, night soil, and the dung of cattle. The arrangements in their farm-houses for economy in the use of the second of these articles are so replete with scientific principle, that I cannot forbear entering somewhat diffusely into details that the horticultural importance of the subject will, I trust, excuse. To render myself the more intelligible, I annex a sketch of a Guipuscoan farm, which will serve as a specimen of all.



It will be seen by the sketch, from the absence of windows in the basement story, that the upper part is the habitation of the resident; that part below the balcony is appropriated to cattle during winter, and loop-holed to give air; A, is the cloaca, to which access is given by the balcony; this is, as shown, completely walled in, and has an aperture near the ground, B.

Care is taken to supply the interior of this enclosure with Indian-corn straw from time to time to give tenacity to the contents, which are, when wanted for use, extracted from B in a consolidated state from the superincumbent pressure, while at the same time the little access of air prevents the volatile parts from escaping; the fluid parts find their way as at C, and where the nature of the surface will admit, are carefully conducted over their beds of Onions, Lettuce, &c. The place I have described is also the receptacle of all other impurities—in short, it is a dung-heap that neither rain nor sun can deprive of its fertilising qualities. It is not necessary to dwell on the culture of their vegetables, where the practice is similar, and, in many cases, inferior to our own; these I shall pass briefly over; neither shall I as yet notice their management of fruit-trees or flowers, confining myself to the alphabetical arrangement in which my observations were noted down of those vegetables grown and exhibited for sale.

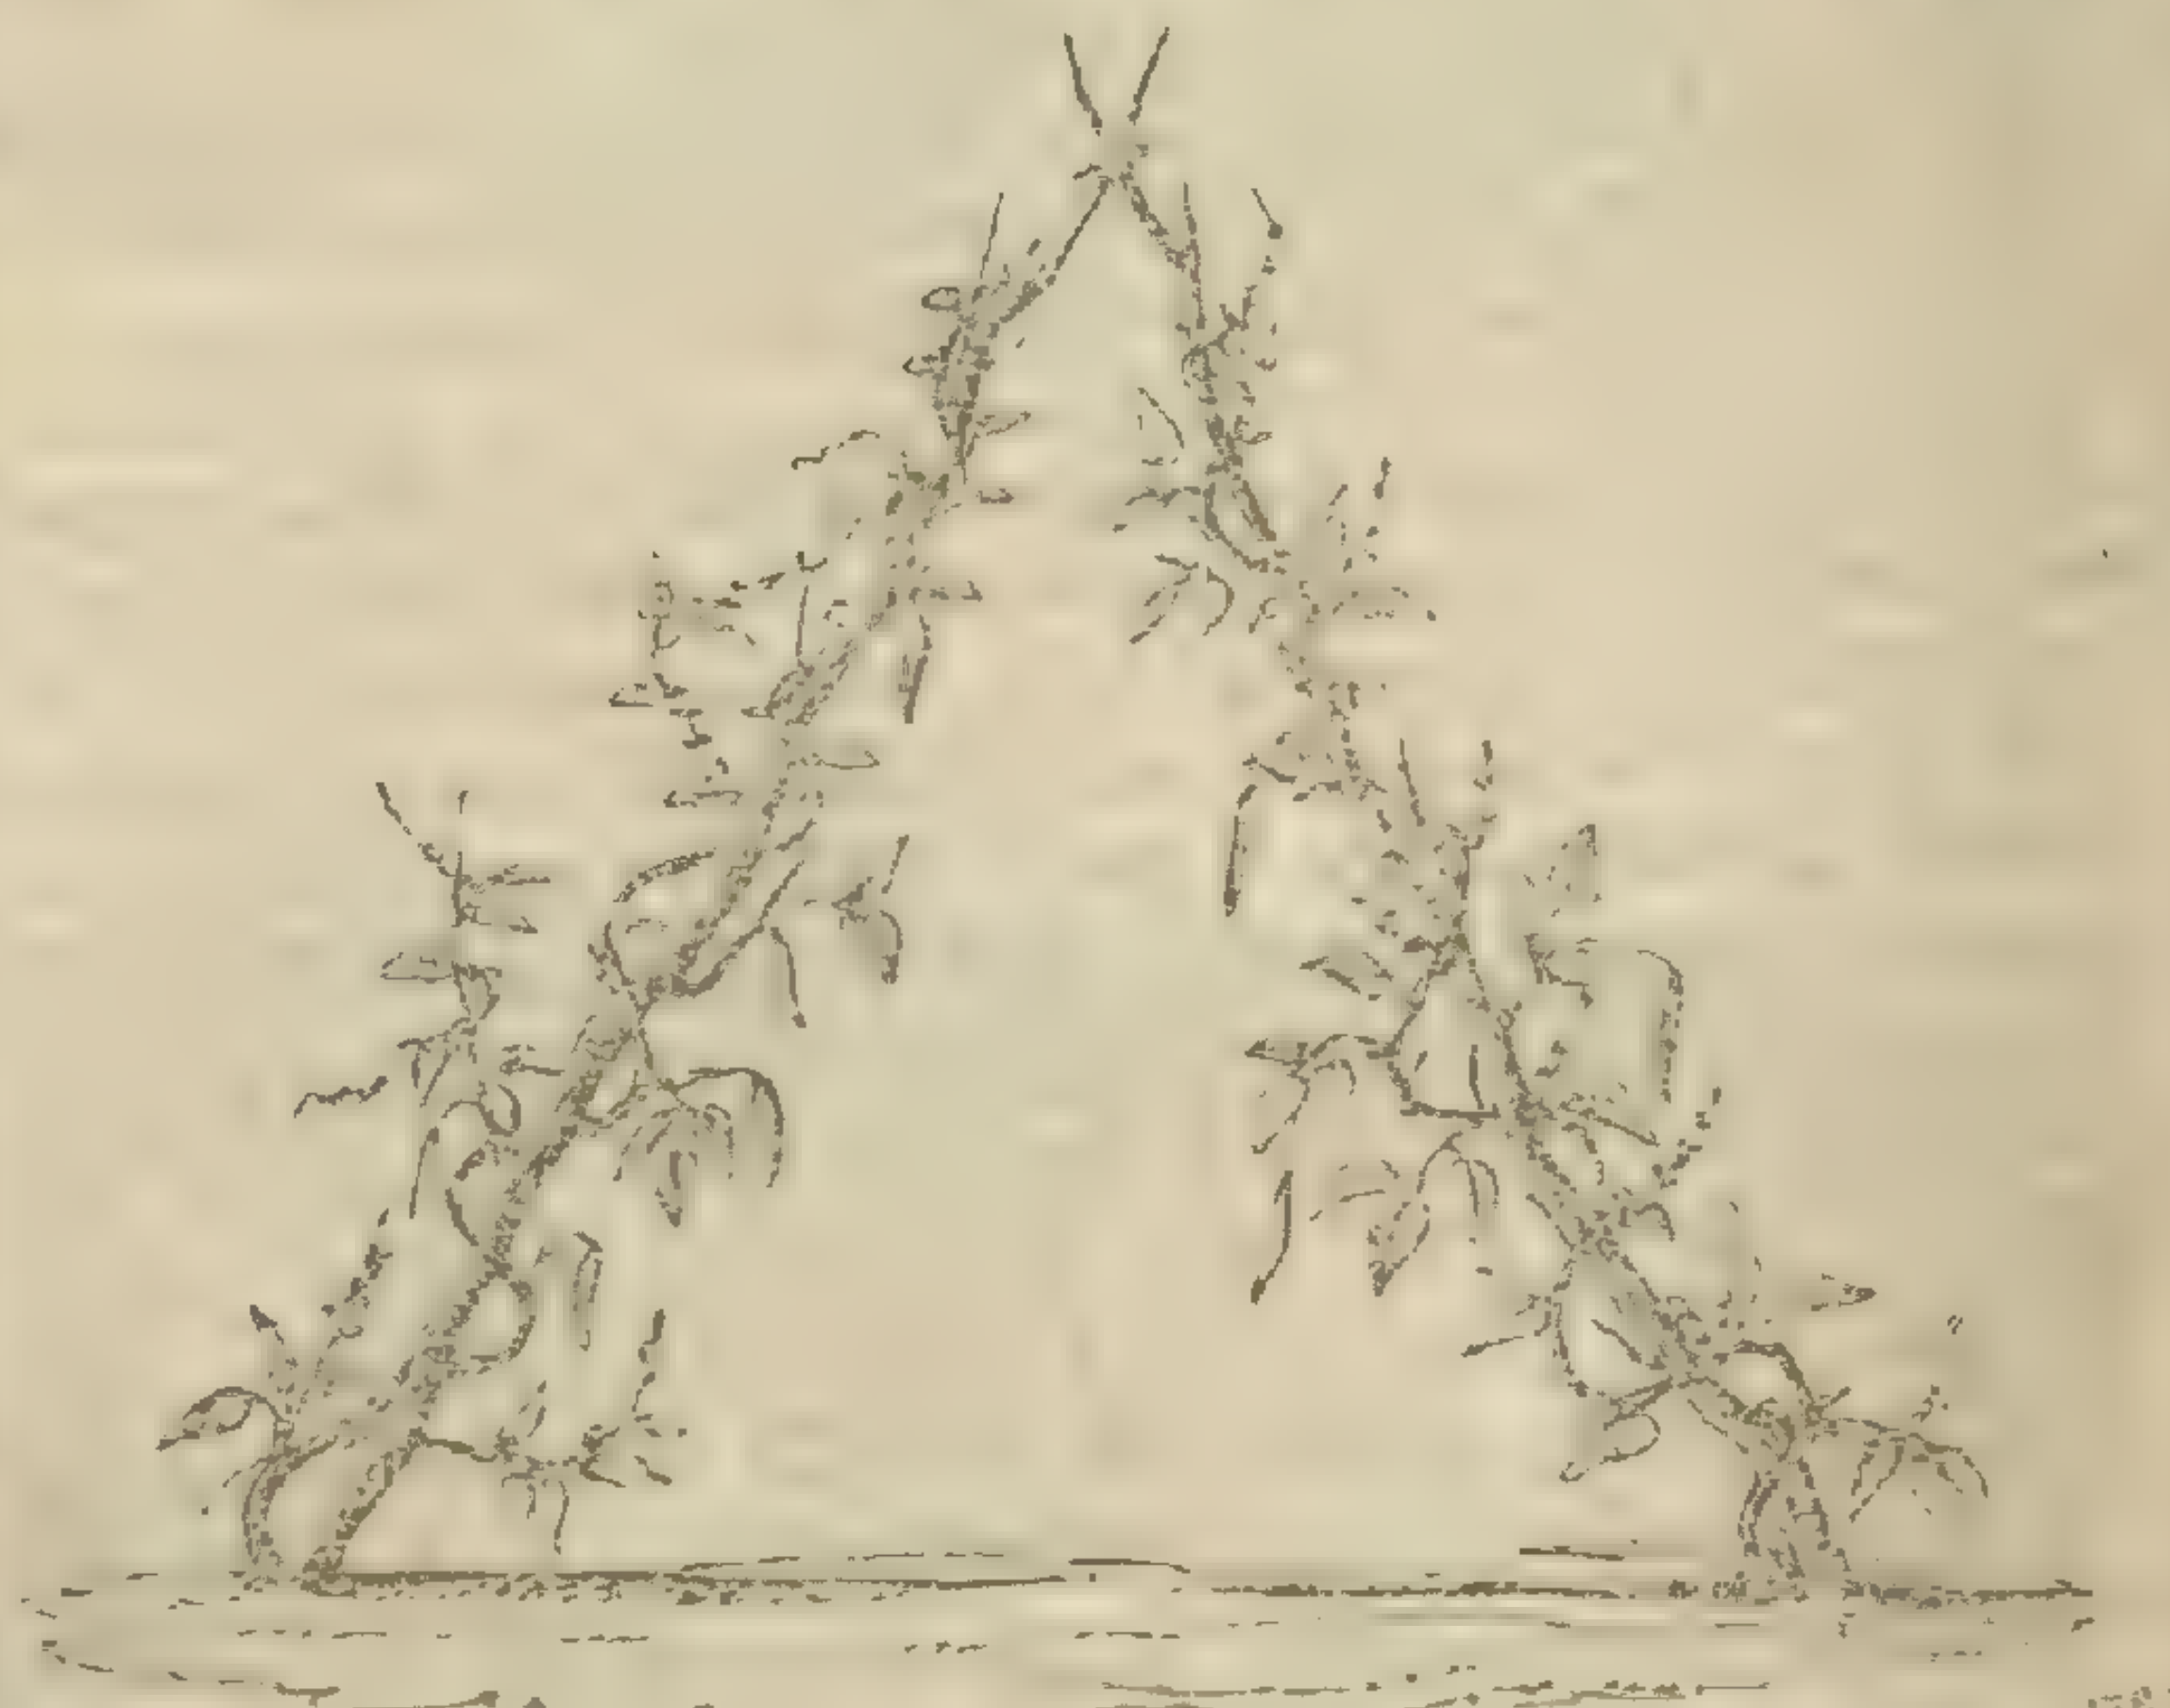
Artichoke; Alcachofa Cardo (Spanish).—The Artichoke is in much demand, and grown to a great extent. Care is taken to protect the stools from frost; they are planted in rows five feet apart, and earthed up during the winter and early spring months by trenching between the rows, the vacant space left by digging the trench (which is usually done in December) being filled with manure. In the month of March, in sunny weather, the earth is removed from the stools, and the crowns split with a shovel, so as to completely divide the stools; strong manure mixed with earth is then inserted into the cleft, which is widened by the operation to about a foot. As soon as all danger from frost is over, which is sometimes not until the commencement of May, the earth is gradually laid bare from the plants and replaced between the rows, where, from the previous trench being filled with manure, it is accumulated as a central ridge, serving to conduct rain during the summer months to the stools. The Artichokes thus produced are of a very large size and excellent flavour, continuing to produce heads until the commencement of December, after which they are cut down to within six inches of the ground and banked up, as before described, with earth removed from the central trench; three or four stems are only suffered to produce heads, the lesser being cut soon after they appear, and sent to market. The pith of these is extracted, and forms a palatable ingredient in the puchero or olla, a favourite Spanish dish. Artichoke bottoms are also combined with capsicum in a sort of stew made of fowl, "well worthy the attention of the curious."

Basil, Sweet; Albabaca (Spanish).—Cultivated as a pot-herb, and enters freely into all Spanish dishes.

Beans, Broad; Habas (Spanish).—Treated agriculturally, and rarely cultivated in gardens. No other variety known than the common Horse-bean.

Beans, Kidney; Aluvias, Habichuela, Judias (Spanish).—Rarely grown in gardens, but sown with Indian Corn in the fields, round the stalks of which the plants find support; they are used in the dry state for soups, &c.

Beans, Scarlet-runner; same as in Kidney (Spanish).—Grown in gardens, in rows north and south, four or five feet apart, supported by stout sticks placed within the rows, and meeting in the centre at top, crossing each other, and tied thus: this mode of culture affords great facility for gathering the pods, as well as security against high winds.



Beet; Betarraga, Betarrata (Spanish).—Much grown for winter salads; sown in April, in drills two feet apart, and thinned to the same distance in the rows: is considered to be tenderer if copiously watered during heats of summer; no manure used; beds dug deep previously to sowing.

Cabbage; Berza (Spanish); Brocoli (Broculi); Cauliflower (Coliflor).—Little skill is displayed in the cultivation of these. Cabbages are cut before their heads show. Broccoli are to be seen in the autumn, as well as Cauliflowers; these latter are sown in the early spring, under a south wall, generally between the buttresses with which the walls of their houses are supported, and serve to shelter the seedlings from east or west winds; the survivors, if any, produce fine heads in autumn: liquid manure is supplied, if local circumstances admit.

Carrot; Zanahorria (Spanish).—Sown broadcast in February, March, April, and May; always drawn young; manure never used.—*E. W. Churchill, Capt. R.M.*

(To be continued.)

KIDNEY-BEANS.

At the desire of one of our correspondents we have endeavoured to obtain the synonyms of most of those kinds described at p. 236, and which we here insert.

De Soissons.—Syn. Long Pod, Large running White, White Long Pod, Sabre à rames, très grosses cosses, Dutch Case-Knife beans, Long White, Large White Sugar, Haricot gigantesque, Rames de Soissons.

Prague.—Syn. Prague rouge, Rames de Prague rouge sans-parchemin.

Sophie.—Syn. Sophie sans-parchemin, Rames Sophie sans-parchemin, Rames prédome sans-parchemin.

Haricot du Cap.—Syn. Haricot du cap marbré, Rames du cap marbré, Phaseolus roseus of Bosc.

Haricot d'Espagne.—Syn. Rames d'Espagne, Pale Turkey, Thick Scarlet Runner.

Nain hâtif de Hollande.—Syn. Dutch Long Pod, Large White Dutch Dwarf, Nain blanc sans-parchemin, Early Dwarf Dutch.

Flageolet.—Syn. Brewer's White, Early White.

Deux à la touffe.—Syn. Haricot Nain de Bohémie à grosse touffe.

Suisse rouge.—Syn. Dwarf Red Speckled, Fulnér's Speckled Dwarf, Long Spotted French Bean.

Rouge d'Orléans.—Syn. Haricot d'Orléans, Nain rouge d'Orléans, Crimson Runner.

Bagnolet.—Syn. Haricot gris de Bagnolet, Bagnolet hâtif, Dwarf Black Spotted.

AMATEUR'S GARDEN.—No. XVIII.

The days have been so warm lately, that the amateur will almost be tempted to plant out those tender things which he has nursed with so much care during the winter, in order to render his flower-borders or clumps gay in summer and autumn. The experience of former years, however, particularly in those parts of the country which are subject to late frosts, warns us against planting out such things as Pelargoniums or Heliotropes so soon, unless we have the means of protecting them. It has frequently happened that the thermometer has been several degrees below the freezing point in the first or second week in May; and then, if such plants are out, they receive a check which they do not recover for several weeks afterwards. Trees or shrubs which have been transplanted last winter or spring will probably be suffering for want of rain, and ought to be liberally watered.

If a frame can be set apart for the growth of Melons, the operation will afford much pleasure, and is not a difficult task when commenced at this season of the year; the following directions will ensure success in their management: For the preparation of the frame, the reader must turn to the back Numbers where the management of Cucumbers was described. Cover the bed all over about two inches deep with light turfy loam, and then raise a little mound or hillock in the centre of each light as high as possible, leaving only sufficient room between the soil and the glass for the plants. Press the loam rather firmly with the hand, and then plant out three plants under each sash on the hillock. After they have formed two rough leaves, pinch out the point of the shoot, and in a short time afterwards laterals will be produced; two only must be allowed to grow from each plant, which will give six shoots under each light. If the plants are healthy, their roots will soon show their points through each mound of earth, and more must therefore be added from time to time until the soil is nearly level. Train the shoots regularly over the bed; and when they grow to within two or three inches of the back and front of the frame, pinch out their points, which will cause them to send out laterals and produce flowers and fruit in abundance. Observe now on which side shoots the finest fruit sets, and only allow one to grow from each main stem; that is, two fruit on each plant. After the fruit has set, stop the lateral at the second joint beyond it, removing at the same time all the remaining fruit and flowers which are not required; and during the season it will frequently be necessary to go over and remove some of the leaves and numerous laterals which will be produced, and which would otherwise crowd the frame. When they are first planted, it will often be necessary to shade slightly during bright sunshine in the middle of the day; but when the fruit is ripening, give all the light possible in order to render it highly flavoured. Give air freely during the day when the temperature reaches 70 or 80 degrees, and allow the fruit to be partially shaded by the leaves when it is young; but when approaching to ripeness, place it upon a piece of slate or tile, and let it be fully exposed to the sun. With regard to water, there are three things to be noticed: do not give much over the leaves or near the base of the stems, as it is apt to injure them; keep the frame rather dry when the fruit is setting, and withhold water altogether when it is ripening. When nearly ripe, allow some more flowers to set for a second crop; and when the first is removed, water the bed well, and manage as before.

By this system, the frame is not crowded with a mass of worthless shoots, which only rob one another; and the cultivator has always the number of fruit which he calculates upon having: thus, a frame with three sashes will produce 18 excellent Melons for the first crop, and if the season is fine, nearly as many more afterwards. In a favourable season, good Melons may be raised on an exhausted hotbed which has been used for striking cuttings in the spring.—*R. F.*

HOME CORRESPONDENCE.

French Propagation.—I cannot but think that your Paris correspondent, in page 280, betrays some ignorance of what is done by our English propagators, and therefore I fear your readers will be induced to suppose our gardeners are far behind our neighbours. I suspect he is not *au courant* with what is done in our best establishments in this country. Those who have visited some of the celebrated English nurseries, and observed the different modes of propagation, will not, I think, agree with him. As regards Roses, I believe that the method adverted to, of striking cuttings, and grafting in winter and early spring, has been long followed by Rose-growers here. I know that at Mr. Rivers's, of Sawbridgeworth, there were lately Roses in full bloom that had been grafted in January, and had then produced shoots fit for cuttings, and there were thousands of cuttings struck and striking. The troublesome French method of plunging in tan, and placing bell-glasses over them, I learn, is not followed in that establishment: each cutting is placed in a very small pot, about one-and-a-half inch deep, and one inch in diameter, made expressly for the purpose; these are then placed in shallow pans with perforated bottoms, the holes very numerous, and these are placed on a gentle hotbed in a brick pit, or garden frame, in which they strike root in about twelve days on the average, although some varieties, it is stated, root in eight days; the success is so complete, that, as Mr. R. states, scarcely one cutting in twenty fails. This method, I believe, with some modifications, is general among English cultivators. Is not this a manifest improvement on the bell-glass system, as no wiping of glasses nor syringing is required? With respect to the Rosa devoniensis, it was sold last May and June at 21*s.* per plant; in August it was advertised at 10*s.* 6*d.*, and I believe will be sold this spring at 5*s.*; will it be cheaper in France? As to the facility with which the French cultivators strike cuttings of Roses, I may mention that at Sawbridgeworth the Crimson Perpetual, and all the varieties of Moss Roses, are so propagated. Ask your correspondent whether the attempt to do this has been successful in France? With regard to the comparative neatness and cleanliness of French and English propagators, or rather of their houses, your correspondent should see the propagating-houses of Messrs. Low, Knight, Rollisson, &c., &c.: he would then, I think, not have much to boast of regarding "the superiority of French propagators." A word as to French grafting. The Frenchman sticks a graft of some choice Azalea on the summit of a long crooked stem of Azalea pontica, one of Pinus Cembra on a stem three or four feet in height of the Weymouth Pine, a choice Rhododendron on the top of a naked stem of Rhododendron ponticum, or a graft of Clematis azurea on a stem a foot high of Clematis Viticella, &c.; these make plants, it is true, but plants hideous in the eyes of a good English cultivator, who places his scion, if possible, in the soil, so that it takes root and soon becomes independent of the stock, forming a handsome and sound plant. Owing to almost unfailing sunshine, the French grow Camellias more rapidly than we can in England; but their plants are "drawn up," and seldom show bloom-buds so early as those raised in England, which are much more stocky and robust. I may also observe, that in the winter-grafting of Roses the French generally use the common Damask for stocks, on which grafts take readily enough; but this is a troublesome and unfit stock, throwing up numerous suckers, and many Roses live but a very short time on it. Do not imagine I have any John Bull prejudices about me, or am unwilling to give all due praise to my neighbours. I know the French have some great merit as regards their horticulture—but fair play is a jewel—and, I take it, any impartial observer who has considered both sides of the question, and seen both sides of the Channel, will admit that the English propagators of plants are not surpassed by those of France; and I should not be afraid to reverse the proportion and say, that in fact the English surpass the French. I leave it to others to defend our growers of Heaths, Geraniums, &c.—*Totty.* [Our Paris correspondent is a practical man, well acquainted with English cultivation; at the same time we are ready to state not only that we agree with Totty's criticisms of foreign propagation, but that as far as we have seen anything of French specimens of grafting, they did so little credit to the horticultural skill of our neighbours across the Channel, that we should be ashamed to acknowledge them as English workmanship.]

On Growing Orchidaceous Plants in common Stoves, with a List of Plants best suited for this purpose.—I have lately built a small stove 25 feet long by 14 feet wide, and have purchased 50 of the best stove plants for cultivation. I now wish to obtain about the same number of species of Orchidaceæ suitable to be grown in the same house with the stove plants. I have read in various works that it is requisite to have two houses for the successful cultivation of this tribe, viz., a hot and moist house, and a hot and dry one; but have been recently informed that there is a number of species that will flower equally well in a stove with the treatment of stove plants. I should feel obliged by receiving a list of 40 or 50 of those best suited to be grown in the same house with stove plants, distinguishing such as do best on wood, in baskets, and in pots—which require most heat and which the least, and any particulars of interest to a beginner. I also am desirous of knowing the degree of heat required by such plants: what should be the average range of heat from 1st Dec. to 31st March, for the day and also for the night, from March to June, from June to September, and from September to December.—*X. X. X.*—[To grow Orchidaceous plants in the highest state of perfection several houses would be requisite: for example, there should be a cool house for those which inhabit the high lands of Mexico and Guatemala; a warm and moist one for others which grow in the hot damp valleys of India and other parts of the tropics; a third kept warm and dry for containing those which are in a state of rest; and a fourth for plants in flower. But however beautiful and interesting this tribe may be, few persons would go to this expense; and many have succeeded admirably in growing a selection, as *X. X. X.* has been informed, mixed with other stove plants. It is difficult to give directions for the management of a house of this kind without seeing it, but the following should be attended to. Keep the Orchidaceous plants as much together as possible, either at one end or along the front shelf. This is necessary, in order that they may be kept more moist or shaded than the other plants. If the house fronts the south, shade will be indispensable during bright sunshine in summer and autumn. The temperature of it during the dull months of winter, that is from Nov. to Feb., should not exceed 60° by night. As the spring advances raise it to 65° and 70°; and it may be kept at that as long as artificial heat is necessary. If the summer and autumn are warm, no fire will be required for two or three months. Always allow the temperature to sink several degrees lower at night than during the day; if this is done, and the stove kept damp enough, the plants will be covered with dew in the morning. The following is a list of those most suitable, with the information which *X. X. X.* requires. 1. *To be grown in pots and placed near the warmest end of the stove.*—Dendróbium nobile, one of the most lovely yet known; Oncídium papílio, an interesting kind, having flowers like a butterfly; Peristéria elata, the beautiful Dove-flower; Miltonia candida; Cattleya labiata, C. Mόssiæ, C. crispa, C. intermédia, C. Harrisóniæ—these flower in great profusion during summer, and are remarkable for their great beauty; Cymbídium sinense, with dingy-coloured flowers, but very fragrant; Zygopétalum Máckaii, Z. intermédium, Z. crinitum, very showy and sweet-scented; Brássia caudata, B. Lanceana, and B. maculata; Acanthophíppium bícolor, is easily cultivated, and produces a nest of flowers in spring; Gongora atropurpúrea likes heat and moisture, the flowers are striking and curious. 2. *To be grown in pots and placed in the coolest end of the stove.*—Oncídium Cavendishianum, produces large spikes of yellow flowers; Cattleya Skínneri; Epidendrum Stamfordianum, whose flowers hang very gracefully, and the violet markings of them are delicate and beautiful; Trichopília tórtilis, with finely-spotted flowers; Catasetum maculatum; and Pháius grandifólius, which should be kept near the light, and is very thirsty while growing: Maxillária aromática and cruenta, have fine yellow flowers highly fragrant; M. tenuifólia, has pretty spotted flowers; Cyrtochilum maculatum, and several varieties of it, are well worth cultivation. 3. *To be suspended in baskets or on blocks of wood near the warmest end.*—Dendróbium cucullátum and fimbriatum, the former with rose-coloured, the latter with pretty yellow fringed flowers; Oncídium ampliatum, large var.; O. Lanceanum, one of the best of the genus, will also do well in a pot; Aérides odoratum, very sweet; Saccolábium guttatum—both of these want a very warm and moist situation, but their beautiful rose and lilac blossoms will repay any trouble. 4. *To be suspended in baskets or blocks of wood near the coolest end of the stove.*—Lǽlia autumnalis, L. álbida, and L. anceps, are very ornamental, resembling Cattleyas; Oncídium leucochilum, is easily grown, and the delicate white of the lip contrasts well with the brown markings of the other parts of the flower; Odontoglossum grande, whose flowers are very large and particularly striking; Stanhopea tigrina, and several other species, send their flowers downwards in the same direction as the roots, and have a very curious appearance. The whole of these plants may be grown in a common stove such as *X. X. X.* describes, and would form a collection of great interest; many of them producing flowers of the most lovely description, and scenting the air with the sweetest odours, the flowers of some bearing a great resemblance to animals—*R. F.*]

Sálvia patens.—I have had a sad destruction among my Sálvia patens this winter, having lost more than two hundred plants that were covered in the same way as those of Mr. Watson's (page 254). Others had three inches of coal cinders over them, one-half of which died also. In the same bed, and unprotected, the Sálvia fulgens and many of the dwarf Verbenas are alive, and even the scarlet Geranium lived out here last winter, without any artificial protection. But Mr. Watson, myself, and probably many others, have killed our Salvias by over kindness, owing to the dampness from the covering. If we had acted in the opposite extreme, and uncovered the crowns of our plants, turning a flower-pot or a mat over them in frosty weather, we should have saved them. Had it been a dry autumn and winter, our covering might have been of some avail; but as we have lost them, it is but justice to your respectable correspondents who told us of the hardiness of their plants, to acknowledge our own fault. After all, there is nothing gained by leaving such a plant as this in the open beds, as it will keep in a shed or cellar like a Dahlia root. —*D. Beaton.*

Brachycome iberidifolia.—Having seen some mention made in your two last *Chronicles* of the Brachycome iberidifolia, the following account may perhaps be useful to some of your readers. I had a plant last autumn which flowered very partially, and came, as I thought, to a premature decay. I took my chance, however, of scattering what *might be* seed upon the surface of the mould in the pot. This was done about the latter end of October; the pot remained in my greenhouse all the winter, and was occasionally watered as the spring advanced; I have now above 30 plants which are looking quite healthy. I have bought at three several shops packets of seed of the above plant, which were sown by me above a month ago, and there is no appearance of germination yet; but I do not intend to be in a hurry in putting them aside.—*F. D.*

Hacon's Pear.—For Mr. Rivers, jun.'s information, and your readers generally, I beg to state that Hacon's Incomparable Norfolk Seedling Pear, the authenticity of which Mr. R., jun., disputes in the *Chronicle* of March 16, was raised by Mr. Hacon from the pip of a Pear gathered off "Rayner's Seedling," the tree noted in the *Chronicle* by Mr. R., jun., as one of 50 or 60 years old, and now growing in the yard of a baker of the name of Hall, not Hill, at Downham. The original Hacon's Seedling is now growing in Mr. Hacon's garden, at Downham, and if the fruits of the two trees be compared together, it will be found that although like as to form, the Hacon's Seedling is superior in flavour. When Mr. Hacon first introduced the Pear to general notice at the horticultural show at Norwich, he asked me to give it a name for that exhibition, prior to sending it, and from the surpassing quality of the fruit, which I then tasted, I told him that I would carry it thither under the name of "Hacon's Incomparable." We have to acknowledge receiving many good and beautiful things at the hands of our Gallic neighbours; but Mr. R., jun., is too patriotic, I am sure, to wish that the palm of merit should be given to any other country for raising either fruit or flower, when authenticity can determine its origin in favour of our own.—*W. Mason, Necton Hall.*

Ash Coppice.—A short time since a correspondent requested to know the period when young Ash plants should be first cut over to produce coppicewood or poles? It will probably depend less upon the age than upon the size of the Ash plants when first cut over. Perhaps four inches in diameter at the surface would be sufficiently great to produce poles for any profitable purpose. If any of our correspondents can furnish us with information upon this subject, we shall be obliged to them.

Newly-planted Gooseberry-trees.—Those persons who have lately made plantations of Gooseberries will find it of great service this dry season to break some marl small, and spread it on the surface of the ground round the bushes, afterwards watering the ground. This will keep it moist a long while, and prevent it from cracking.—*Facile.*

Protecting Potatoes.—I have found that the branches of Beech-trees afford an excellent protection for early Potatoes just protruding from the open ground, by placing them over the rows in the evening, and removing them every morning.—*Facile.*

New Method of supporting Annuals.—Amongst our most showy hardy annuals and other out-door plants are several species of such a brittle nature, that during stormy weather many are often irrecoverably broken or torn to pieces by the wind. Numbers of beds in the flower-garden are thus rendered, in the height of their beauty, perfectly unsightly. To prevent this sort of havoc I have seen many plans resorted to, and often witnessed some that were anything but useful or neat. I will therefore mention a simple mode particularly suited to such kinds as are grown in beds, and which combines all the advantages necessary to avoid the disastrous consequences referred to. When the plants are about three inches high, thinned, and properly cleaned, I select a number of neat twiggy branches, such as dry, fresh pieces of Spruce, &c. These I prepare about 18 inches long, pointing them at the end so as to resemble pea-stakes in miniature; when ready, they are placed firmly among the plants all over the bed, leaving them when finished about a foot high, so as to be completely out of sight when the plants are in flower, always leaving the stakes of such a height and distance as the taste or judgment shall deem sufficient for the habits of the various kinds thus treated. So completely do the plants grow up and intermingle themselves in all directions among the branches, and with such security, that no breeze ever affects them, while the beds exhibit that freedom and elegance of appearance which I have never seen so effectually accomplished by any other method. Some may consider these dry branches disagreeable to the sight in connexion with a flower-garden before the plants rise to hide them; but when neatly done, the reverse is the case. It is in this as in other matters: while one person will perform the work with such materials as will of themselves be ornamental without either flowers or foliage, another will manage it so clumsily, that it would defy the growth of a Bramble-bush to hide the awkward deformities of his handywork. However skilfully plants may be selected as regards their natural beauty, arrangement, or high keeping, one misplaced stake or ill-tied plant will mar the effect of the whole.—*J. E.*

Shrivelling of Grapes.—With respect to "No Conjuror," page 269, I beg to state that I hope he never will have a greater difficulty or "absurdity" to complain of, than being desired by an employer to try an experiment, which, if it did not succeed, could not do any harm. It will be apparent that "No Conjuror" and I agree as to the cause and the means of prevention of this shrivelling; but we differ in this: that while, before these means of prevention can be adopted, he is content to lose some and have others deformed, I aim at preserving as many bunches as will be necessary, and these well formed. Other matters render it impossible for me now to make a statement of facts relative to the shrivelling and shanking of Grapes at an advanced stage; but I may state, in passing, that if "No Conjuror" had kept only half the quantity of bunches on his Frontignan Vine previously to his renewing the border, in all likelihood he would have found them free from shanking and shrivelling. If, as he states, the roots of his Vines descended so perpendicularly through a mass of blue and yellow clay as to put out no horizontal rootlets, I am not *surprised* that he could remove the inert, unappropriated mass, without having recourse to wet mats, shading, &c.; though with respect to the propriety of the period chosen for performing the operation, I entertain stronger doubts than I do relative to the fact that the person who formed a Vine border out of such materials could indeed be "No Conjuror."—*Robert Fish, Putteridge Bury.*

To Stop the Bleeding of Vines.—Perhaps some of your readers are not aware of the means of stopping the bleeding of a Vine when cut rather late in the season. In reading Mr. Clement Hoare's Treatise some two or three years ago, I was rather surprised to find him recommending a hot iron and sealing-wax; while I have many times stopped the loss of the sap by the following simple preparation:—One-fourth of calcined oyster-shells, beaten to fine powder in a mortar, and three-fourths of cheese, worked together, until they will form a sort of paste; press this mixture into the pores of the wood, either with the thumb or any other means, it will effectually stop the flow of the sap; sometimes a repetition may be necessary if not well forced into the pores. If you should think this simple means worth noticing in your *Chronicle*, it may facilitate the sometimes difficult method of stopping the bleeding.—*Charles Moor.*

Effect of Sulphur on Vegetation.—In previous Numbers of the *Chronicle* a mode of destroying ants by sulphur has been proposed and commented on. It is more probable that these insects were driven away than killed (for there does not appear to be evidence of their death) by the formation of sulphuretted hydrogen, which I imagine would take place by the exposure of sulphur in such a position as it was placed in this instance. These communications of Mr. Bowers are interesting in connexion with one on the influence of sulphuretted hydrogen on vegetation, in your Number of March 19th. Mr. Bowers states that the grass on the lawn, around the holes where the sulphur was deposited, grew much better than in other places: this was probably owing to the formation of sulphuretted hydrogen. It would be interesting to know what would be the influence of applying small portions of the sulphurets, such as those of potassium or iron, as manures. Some of your correspondents may have an opportunity of trying this. Now I am on the subject of sulphur, I may mention that I was much surprised the other day, on going into the Palm-house of the Messrs. Loddiges of Hackney, to find a very perceptible smell of sulphurous acid, and, on inquiry, found that it proceeded from the sulphur vivum and quicklime which is spread over the flues for the purpose of destroying the red-spider. I had always supposed that a very small quantity of sulphurous acid gas would destroy life, and on turning to Dr. Lindley's Introduction to Botany, page 385, I find it stated that "Drs. Turner and Christison found so small a quantity as $\frac{1}{10,000}$ of sulphurous acid gas, a proportion so minute as to be imperceptible to the smell, sufficient to destroy the life of leaves in forty-eight hours." Yet although the quantity was so great at Loddiges' as to be very perceptible to the smell, and to destroy the spider, I was assured that the plants were not injured by such treatment. Whether plants in closed cases, as those of Drs. Turner and Christison, were or are more obnoxious to the influence of deleterious gases than plants more exposed, is a matter for inquiry. If so, plants kept in Ward's cases ought to be carefully removed from the influence of such agents. At the last meeting of the British Association at Plymouth, Mr. Ball of Dublin brought forward a curious instance of the destruction of plants in a small house on Mr. Ward's plan, by placing in it a basin containing the decomposing head of a porpoise. In the course of six hours there was not a plant that had not lost its leaves or fronds.—*E. L.*

New Grafting Wax.—I have been in the habit of using about equal quantities of bees'-wax and common tallow as a mixture for grafting, in lieu of the dirty method of claying the graft with the stock. The mixture must, of course, be used warm, and laid on with a small painting-brush; and it may be kept hot in the same manner that cabinet-makers adopt to keep their glue hot. The method is not only ten times quicker than the old custom of using clay, but as much cleaner, since the operation may be done by a lady without inconvenience. It effectually keeps out all wet, winds, &c., and prevents the loss of any sap, as it closes up all ingress and egress of either, thereby rendering the operation more certain. The ends of the stock and graft may also be touched with the cement, to prevent the loss of sap.—*Charles Moor.*

Daniell's Manure.—In a report of a communication of mine to the Ashmolean Society respecting Daniell's patent manure, copied in the *Gardeners' Chronicle* from the "Athenæum," it is stated, on the authority of the inventor, that the manure in question consists of carbonate of ammonia, sawdust, and bituminous matter. It should, however, have been added, to avoid misapprehension on the part of the public, that I mentioned at the time my own inability to discover any but the merest trace of ammonia in the sample I received from the patentees; a fact entirely in accordance with what has been lately communicated to me, with respect to its composition, by these gentlemen. It is very possible, indeed, that although the manure *contains* no ammonia, it may nevertheless *absorb* some from the atmosphere; but it will be time enough to inquire as to the principle on which it operates, when a greater number of observations have been made with respect to its efficacy, and the kind of soils to which it is beneficial. At present the evidence to this effect is highly encouraging, so far as it goes, resting, as it does, on the respectable authority of Mr. Webb Hall; but it is to be hoped that before another season has elapsed, we shall obtain the results of experiments made by a number of individuals on every variety of soil, and with crops of all descriptions, so as to remove all suspicion on the subject, and to pave the way to some more clear understanding of the kind of influence it exerts.—*Charles Daubeny, Botanic Garden, Oxford.*

Guano.—In reply to the inquiries by "E. F. L." about guano, I can state that a top-dressing of 3 to 4 cwt. to the statute acre, mixed with three to four bushels of wood-ashes or charcoal, will be found enough to give a splendid crop of grass; 2 cwt. for Wheat, Oats, or grain of any description, and 4 cwt. for Turnips. If wood-ashes or charcoal cannot be had, the guano may be used alone; but it should be on a damp or moist day, so as to have it washed quickly into the soil.—*W.* [If so large a quantity as 4 cwt. is really necessary per acre, this substance will be much too dear to be employed by farmers.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

April 29.—Mr. Edward Solly gave his first Lecture on Horticultural Chemistry. After briefly alluding to the formation of a Chemical Committee at the instance of his Grace the Duke of Devonshire, by whose munificent subscription of 50*l.* annually, and the contributions of other Fellows of the Society, the expense of the chemical investigations is defrayed, Mr. Solly proceeded to state, that in order to render the succeeding lectures intelligible, it would be necessary for him to call the attention of his hearers in the first place to certain elementary facts, upon which everything else depends. The object of Chemistry was to study the nature and the composition of substances, and to investigate the processes of nature, with the laws which regulate them. Of this important union, no part is more interesting than the philosophy of vegetation, to say nothing of the great importance of it. Chemistry being purely an experimental science, nothing can ever be taken for granted; all progress must necessarily be step by step, and the results of experience are its only solid foundations. Theories, however, are of great use; because, when many certain facts are collected together, a theory or plausible explanation assists in suggesting new experiments, and in eliciting the truth. He then proceeded to observe, that inferences may be drawn from chemical experiments which may indicate more than they show at first sight, as is proved by the processes of testing and analysis, when the presence of a substance is known, not by separating it from all others, but in consequence of some marked peculiarity of one of its compounds. Mr. Solly then proceeded to illustrate experimentally the two great classes of changes called COMBINATION and DECOMPOSITION; to point out what kinds of substances combine, and in what manner this is effected; to show the effect of heat upon what is termed affinity in chemistry; and to demonstrate the total difference between combination and mere mixture. The wide distinction between compound bodies and their components; the variable character of chemical affinity; how very strong it is between some bodies, and feeble between others: in what way this affinity is affected by mechanical division; the mobility of particles; and the effects of light—were the next topics to which attention was invited. With regard to DECOMPOSITION, it was shown to be the reverse of combination: two kinds were pointed out; the one, where attraction between the elements of a body is weakened or destroyed; the other, where a new substance, having a strong affinity for one of the elements of some other substance, acts upon that element, and separates it from what it was before combined with. The lecture was illustrated throughout by admirably-conducted experiments. The subject of the next lecture will be "the proof that all plants are composed of the elements called oxygen, hydrogen, nitrogen, and carbon."

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 20.—The Marquis of Downshire, K.P., in the chair. Nine gentlemen were elected members.

Annual Country Meeting of 1843.—B. Borough, Esq., addressed to the council, through Sir O. Mosley, Bart., a communication, placing at their disposal the whole of his landed property in the vicinity of the railway station and canals in Derby, for the purposes of the meeting of next year, should the council decide on selecting that place for the occasion.—Thanks were voted to Mr. Borough for this liberal offer.—W. Adams, jun., Esq., transmitted the following communication:—"Having seen a description of a Dibbling Wheel for Mangel-wurzel, by W. Miles, Esq., M.P., which consists of only one wheel, I send you a drawing of a machine which we have used for 7 years with the greatest success. The only difference between it and Mr. Miles's consists in our using two wheels, which are placed on an axle at any distance apart under 34 in. Now, if only one wheel is used, and the handles are fixed like a barrow, the man who uses it must of course follow the machine, and walk on the ridge, or else by the side of the wheel. Ours having two wheels working upon two ridges (27 inches apart), the man walks in the furrow between them, and with a little practice can use two wheels as easily as one, and work two ridges at the same time."—The drawing which accompanies this description, represents the machine as having the appearance of a detached pair of gig-shafts, wheels, and axle: the shafts being strengthened in the middle by two iron transverse braces of a curved form placed between them, and secured to the inner side of each, the height of each being 3 ft. 6 in., with a flat rim (3½ in. broad), on which the pointed dibs (of a sugar-loaf or mushroom shape, 2 in. long by 1½ in. wide at the base) may be set at distances of 14½, 16½, or 18½ in. apart, as desired.

Sir F. A. Mackenzie, Bart., addressed a communication having reference to the improvements to be effected in agriculture, through the medium of prizes, and the encouragement of societies founded expressly for such objects; entering at great length into a discussion of the best mode of promoting these improvements. Sir F. Mackenzie makes the following observations on the subject of the little manual of "Cottage Economy and Cookery," which Mr. Burke has drawn up and presented to the Journal Committee; the importance and utility which different subjects hold as objects for encouragement by the offer of prizes; and the advantage of a standard code of agricultural improvement:—

I. *Food for Labourers.*—"Mr. Burke's proposal of a cheap publication, giving directions to our labouring classes for nutritious and economical food, is excellent, and much required in England, where beer, white bread, butter, and tea commonly constitute their food, but are neither nutritious nor economical. Our funds cannot be devoted to a more useful purpose than in suggesting comforts to our lower classes. Both the French and Scotch excel the English in the nourishing qualities of their food, and also in its economy; especially the Scotch, whose diet consists of oatmeal, milk, potatoes, and barley, used as a soup or broth. Nothing can be more invigorating than oatmeal as porridge, or baked into cakes; and barley boiled in the Scotch mode, that is, for four or five hours at least, is decidedly healthy and nourishing. I do not give preference to our Scotch diet on my own authority: it speaks for itself to every one who will visit the well-fed districts of Aberdeen, Moray, Forfar, Ayr, &c., in the strong-limbed, broad-shouldered population of the Highlands of Scotland. The Scotch fare is oatmeal porridge for breakfast, potatoes and oat-cake for dinner, and oatmeal gruel or barley-broth for supper: lard, onions, and pepper, with vegetables, being added, by such as can afford them, to the broth; and milk, treacle, or coarse sugar to their porridge; but such luxury is not common, or at all deemed necessary. No expense, in the greater part of Northumberland, or in any part of Scotland, is incurred by the use of beer amongst labourers; water alone quenches their thirst, even when engaged in the toils of harvest or hay-work; and our society would do well to recommend that English farmers should give the value of the beer as an allowance in money to their servants, who would soon learn that it could be better laid out, and more profitably spent in procuring little comforts to themselves or their families."

II. *Subjects for Prizes.*—1. Grain. "I would place a new, earlier, more prolific kind of grain, capable of being grown on inferior soils, as of first importance; since, on grain depends the lives of nine-tenths of our immense population; and one bushel of increased produce in grain over every arable acre in Britain, would add 1,200,000 quarters annually to the present average crops.—2. Roots, &c. The second place should be assigned to new and superior roots, grasses, or any kind of vegetable food.—3. Implements. Superior ploughs, a perfect dibbler, or any other implement capable of performing the various operations necessary for tillage, best, and at least expense, should decidedly stand third, for their benefits would be speedily felt all over the country.—4. Manures, &c. Discoveries of new, valuable, and economical manures; the destruction of the wireworm, turnip-fly, grubs, and remedies for the many other evils which afflict even the best agriculturists, should come next."

III. *Code of Agricultural Improvement.*—"What I wish to see, is, a book on agriculture in all its branches, selected from all that is best, and published under the sanction of a practical committee; with new editions every second or third year, omitting what becomes obsolete, and adding all that is new and useful. Every man possessing twenty acres of land would read this, and profit by it. One visit to a scientific model and experimental farm, such as I have more than once suggested, would do the visitor more good than a winter spent in studying all the essays and pamphlets ever published."

On the report of the Duke of Richmond, the Agricultural Society of Newfoundland was elected a corresponding Society.—The Cardiff Farmers' Club having called attention to the question of lecturers being sent out to convey correct information in a detailed and familiar mode on chemistry, botany, geology, and other branches of agricultural science, to the different Farmers' Clubs established throughout the country, the Council finally agreed, "That they highly approve of the establishment of Farmers' Clubs, but cannot entertain the suggestion of sending out persons to deliver lectures."—J. M. Norman, Esq., of Slangham Park, Sussex, called attention to the application of phosphate of magnesia as a manure for Potatoes.

FLORICULTURAL SOCIETY.

April 26.—The first Exhibition for this year was held at the Crown and Anchor Tavern, when the following prizes were awarded. AMATEURS.—For the best pair of Auriculas, Hedge's Britannia, Page's Champion, 1st prize to Mr. Burrup; second best ditto, Grime's Privateer, Page's Champion, to Mr. Lidgard; for the best grey-edged ditto, Oliver's Lovely Ann, to Mr. Lidgard. PROFESSIONAL FLORISTS.—For the best pair of Auriculas, Oliver's Lovely Ann, Fletcher's Mary Ann, 1st prize to Mr. [illegible]; best green-edged, Cooper's Imperator, to ditto; and grey-edged, Pollock's Ne plus Ultra, to ditto. [illegible] [illegible] specimens of [illegible]. [illegible] was awarded to Goldham's Duke of Wellington, a green-edged variety in the way of Booth's Freedom; the quality of the paste is firm, pure, and [illegible] [illegible] the white, and the intense dark of the coloured ring. A grey-edged flower of Mr. Goldham's, named [illegible], received the 1st prize in the [illegible] class; a good flower, in which the paste is fine and pure; the colour a dark purple, with good grey edge. 2nd, Goldham's Violet, good tube and paste, [illegible] 3rd, Wilson's [illegible] [illegible] Buck's George the Fourth, Hutton's Earl Grey, No. 9, and Pearson's Alexander, to Mr. Wilson. There was also a pretty collection of Pansies, from Messrs. Lane of Berkhampstead.

COUNTRY SHOWS.

Cork Horticultural Society, April 26.—The first meeting of this year was held at the Corn Exchange, and [illegible] Although [illegible] without giving a more than partial glance of them. [illegible] Cinerarias, Azaleas [illegible] The collection from James Smith Barry, Esq., contained a very fine Azalea [illegible] White Indian Azalea [illegible] Cape Heaths and Epacrises. [illegible] double Wallflower. From the gardens of [illegible], Esq., [illegible] A collection of [illegible] W. Parker, Esq. [illegible] A collection of greenhouse plants and flowers, from [illegible], Esq.; a very large plant of the Fuchsia corymbiflora, coming into flower, [illegible]; and a splendid collection of [illegible], also fine Tulips, Violets, &c. From Messrs. [illegible]'s Nursery there was a dazzling array of beautiful plants, comprising several species of Cape Heaths, Epacris, [illegible] and other greenhouse plants [illegible] Mr. [illegible] contributed several species of Cacti, [illegible] with a fine plant of [illegible], a White Indian Azalea, and other rare plants. The band of the 56th regiment was in attendance during the day, and added to the [illegible] and harmony of the assembly.

North British Professional Gardeners' Society, April 2nd.—The first meeting for the season was held in the [illegible] Room. The articles sent for exhibition were tastefully displayed, and presented to those who delight in contemplating the productions of Flora a sight of great beauty and elegance. The show, as compared with those of former years at a similar season, was of a superior description, which is a proof that the Society is in a flourishing condition. On this occasion prizes were awarded to the successful competitors as follows:—For the best six Auriculas—1st prize to Mr. D. [illegible], gr. to [illegible], Esq., with Thompson's [illegible], [illegible] Champion, [illegible] Robert Burns, [illegible], Radcliffe's Superintendant, and Leigh's Venus; 2nd, to Mr. J. Young, gr. to Thomas Oliver, Esq. For the three best Polyanthuses—1st, to Mr. A. Forrester, gr. to D. [illegible], Esq., with [illegible] Telegraph, George the Fourth, and Pearson's Alexander; 2nd, to Mr. J. Young. For the best seedling Auricula (Young's Prince of Wales;—1st, to Mr. J. Young; 2nd, to Mr. [illegible]. For the best seedling Polyanthus [illegible] 1st, Mr. A. Forrester; 2nd, to Mr. J. Young. For the three best double Wallflowers—1st, Mr. J. Hogg, gr. to W. [illegible], Esq., [illegible], and Purple; 2nd, to Mr. J. [illegible], gr. to [illegible]. For the three best Hyacinths—1st, to Mr. J. Young, with Prince Albert, [illegible]; 2nd, to Mr. A. Forrester. For the three best Cinerarias—1st, Mr. J. Anderson, gr. to the Earl of Wemyss, with C. [illegible], C. [illegible], and C. [illegible]; 2nd, to Mr. J. Thomson, gr. to W. Keith, Esq. For the three best Primulas—1st, to Mr. J. Young, P. [illegible], P. [illegible], and P. hybrida; 2nd, to Mr. J. [illegible]. For the three best Epacrises—1st, to Mr. J. [illegible], E. [illegible], E. [illegible], and E. [illegible]; 2nd, to Mr. A. [illegible], gr. to Admiral Sir P. C. H. Durham. For the three best [illegible]—1st, to Mr. A. [illegible] [illegible]; 2nd, to Mr. J. Young. For the three best hardy Herbaceous Plants—1st, to Mr. A. Forrester, for [illegible], [illegible], and [illegible]; 2nd, to Mr. G. Stirling, gr. to the Right Honourable Viscount Melville. For the four best Pears, two sorts—1st, to Mr. James Goodall, gr. to the Marquis of Lothian, for the [illegible] Pear, and Swan's egg; 2nd, to Mr. J. Thomson. For the six best dessert Apples, three sorts—to Mr. J. Goodall, for the Ribston Pippin, [illegible], and [illegible] Pippin. For the four best baking Apples, two sorts—to Mr. Goodall, Yorkshire Greening and [illegible] Ribston. For the two best heads of Sea-kale—1st, to Mr. G. Stirling; 2nd, to Mr. J. Goodall. For the two best forced Rhubarb stalks—1st, to Mr. R. [illegible], gr. to D. Anderson, Esq.; 2nd, to Mr. J. Goodall; both specimens [illegible], were very large and heavy stalks. For the two best heads of Broccoli—1st, to Mr. J. Goodall; 2nd, to Mr. W. Cuthbertson, gr. to the Earl of Rosebery. The following articles, of excellent quality, were sent from the Gardens at [illegible], but unfortunately too late for competition, namely:—dessert and baking Apples, Broccoli, Seakale, and hardy herbaceous plants. For exhibition were the following articles:—from the [illegible] Nursery of Messrs. [illegible], twenty varieties of early Tulips, from the open ground, and a collection of [illegible] Pansies; from Mr. Thomson, three very fine seedling Cinerarias; from the Nursery of J. Dickson and Sons, six beautiful Cinerarias, namely—C. Imperial Blue, C. Queen Victoria, C. [illegible], C. Macnabiana, C. [illegible], and C. [illegible]; from Mr. A. Forrester, sixteen distinct species of Narcissus, several of them very rare; three distinct species of new [illegible], and a fine specimen of the Tulipa Oculus Solis.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Catasetum Wailesii. Mr. Wailes's Catasetum. (Orchidaceæ. Gynandria Monandria. *Stove Epiphyte.*)—The strange forms exhibited by the different parts of the flower of the several kinds of Catasetum have often attracted notice. In the present instance, the most striking peculiarity is to be found in the anther-case, which instead of being carried out into a very long point or beak, is singularly short and flattened, in the centre of which is [illegible] an elevated [illegible], and beneath this, a pretty large [illegible] [illegible] —*Botanical Register.*

Gloxinia speciosa. Var. Macrophylla variegata. Rough Gloxinia, large Variegated variety. (Gesneraceæ. Didynamia Angiospermia. *Stove Herbaceous Plant.*)—[illegible] and was exhibited at the Horticultural Society. Not only are the flowers [illegible] but the foliage also is much larger, and mottled with pale whitish green about the veins, which considerably enhances the beauty of the whole object.—*Bot. Magazine.*

Amaryllis Banksiana. The Banksian Amaryllis. (*Greenhouse Bulb.*) (Amaryllidaceæ. Hexandria Monogynia.)—This handsome plant flowered with J. H. Slater, Esq., of Newick Park, near Uckfield, who procured it from the Cape. If the same species [illegible] Mr. Herbert [illegible] the species must have been introduced many years ago, [illegible] a leaf and a flower of it in the Banksian collection from the Kew Gardens. It is a greenhouse plant, and grows well in a rich free soil consisting chiefly of sandy loam. The principal points to be attended to in its cultivation are to keep it in a vigorous healthy state while growing, by placing it in a light situation, and giving it plenty of water, and when the leaves die off to keep it warm and dry. It flowers in the autumn, and is multiplied by offsets, or by seeds, when they can be ripened. We extract from Mr. Herbert's work on the Amaryllidaceæ the following observations upon the culture of such plants:—[illegible] —*Bot. Reg.*

[illegible]. [illegible] (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—This plant was brought from the East Indies to Chatsworth by Mr. Gibson, collector to his Grace the Duke of Devonshire. "It inhabits the [illegible] [illegible] near the summit of the [illegible]. It has a strong perfume, somewhat resembling Melic grass, on which account it is highly esteemed by the [illegible] natives, who are fond of adorning their hair with its blossoms [illegible] It is growing here [illegible] upon a block of wood, [illegible] and is now fixed with moss and living vegetable matter, the latter consisting of the roots and stems of five native Ferns, which are flourishing with this and other Orchidaceous plants on the same block of wood. The pseudo-bulbs are invariably two-leaved, spindle shaped, gradually tapering towards the top, and covered with [illegible] scales; their length is about six inches. On the young shoots the scales are thick and covered with green warts. The roots are thick and fleshy, and covered with a [illegible] like those of [illegible]."—*Bot. Reg.*

Cereus [illegible]. [illegible] Cereus. (Cactaceæ. Icosandria Monogynia. *Greenhouse Succulent.*)—At the Botanic Garden, Kew, in July 1841, a specimen of this Cereus, about [illegible] in height, and nearly three inches in the [illegible] diameter of its unbranched stem, produced its large splendid flowers, which do not appear to have been known to any author. In point of magnitude and delicacy of structure they are equal, and even superior, to those of the far famed C. grandiflorus; they are white, with the margins of the petals crisped and serrated. The plant is of a singularly blue or glaucous colour, with about eight deep furrows.—*Bot. Mag.*

Arctostaphylos pungens. Sharp-pointed Arctostaphylos, or Bearberry. (Ericaceæ. Decandria Monogynia. *Hardy Shrub.*)—Seeds of this plant were sent from Mexico by Mr. Blair to the Glasgow Botanic Garden, and the plants raised from them produced flowers in February 1841. Humboldt detected it first in elevated places about [illegible], Andrieux in Oaxaca, and Hartweg at Zacatecas. Hitherto it has been treated as a greenhouse plant, but probably it will be found to bear our winters with impunity in the open air. The leaves are an inch to an inch and a half long, terminated by an acute point, and the flowers, which are greenish-rose coloured, are arranged eight or ten together on short terminal racemes.—*Bot. Mag.*

Catasetum abruptum. Blunt-lipped Catasetum. (Orchidaceæ. Gynandria Monandria. *Stove Epiphyte.*)—This singular species was received from Brazil through Mr. Gogarty at the Glasgow Botanic Garden, where it first flowered in September 1841, and again in October. At first sight it resembles C. luridum, of which it may be a variety; but the greater depression of the whole perianth, and the different form of the lip, are obvious peculiarities. The flowers are green and glaucous, with the labellum yellowish and spotted with brown.—*Bot. Mag.*

Goldfussia isophylla. Equal-leaved Goldfussia. (Acanthaceæ. Didynamia Angiospermia. *Stove Shrub.*)—In habit this species resembles G. anisophylla, but it is at once distinguished by the uniformity of its opposite leaves, and it is a smaller plant. It is a native of Sylhet and is cultivated at Mr. Cunningham's nursery, Comely Bank, Edinburgh. It thrives well and flowers freely during a great part of the year in the stove, without requiring any particular attention. The flowers are lilac, veined, and funnel-shaped.—*Botanist.*

MISCELLANEOUS.

Botanical News: Truffles.—We find that the first volume of Siebold's Flora Japonica is completed by the publication of the 20th Part; in several of the latter Parts are some interesting notices which from time to time may be laid before our readers. M. Boissier is travelling in Greece and Turkey. A work on the *Species of Ferns* is announced by Sir W. Hooker. Dr. Lindley's *Sertum Orchidaceum* is completed by the 10th Number. At Berlin, Dr. Klotzsch is completing a general Monograph of the *Crotoneous Euphorbiaceæ*, and is anxiously soliciting contributions of East Indian and Australian species. The same distinguished botanist has ascertained beyond all doubt that *Truffles* may be cultivated as well as Mushrooms. He has ascertained that the best course is to take Truffles which are no longer good for the table, being over-ripe and nearly in a state of decomposition, diffusing a disagreeable odour, to break them into pieces, and place them two or three inches deep in the earth, in rather raised flat places, under copse or underwood, protected from the North and East winds. Truffles in the state in which they are eaten are never ripe, and therefore unfit for propagation.

Habits of Animals.—The following entertaining letter on this subject is extracted from the last number of "The Gardener's Magazine," in answer to some questions by Mr. Loudon as to the use of animals in gardens:—"You say, 'you will send to a gardener in the country for a weasel.' You must send for two, male and female. A bachelor weasel, or a spinster weasel, would not tarry four-and-twenty hours in your garden. Either of them would go a sweethearting, and would not return. You remark that your 'hedgehogs soon disappeared.' No doubt; unless confined by a wall, they would wander far away, and try to get back to their old haunts. You request me 'to suggest some place of shelter for them, to which they might have recourse when attacked by the cats.' I cannot believe that hedgehogs are ever attacked by cats. A garden, well fenced by a wall high enough to keep dogs out, is a capital place for hedgehogs. But there ought always to be two, man and wife. Your 'frogs and toads disappeared in a very short time, notwithstanding a small cistern of water which was open to them.' They would have preferred a pond or ditch. No doubt they left you in search of more agreeable situations. 'Were it not for the cats, we should have plenty of birds.' Granted. Cats amongst birds are like the devil amongst us; they go up and down seeking whom they may devour. You must absolutely chase them away for good and all, otherwise there will be no peace for your birds. A small quantity of arsenic, about as much as the point of your penknife will contain, rubbed into a bit of meat either cooked or raw, will do their business effectually. 'I have often thought of suggesting to the Board of Woods and Forests the idea of feeding the birds, or rather of putting down the different kinds of food proper for the different kinds of singing birds, in Kensington Gardens.' This would not be necessary. All our soft-billed summer birds of passage, and those soft-billed birds that remain with us the year throughout, live on insects; and insects abound during the period when these birds are in song. But if you could prevail upon the Board to prevent idle boys from chasing them, and gunners from killing them, and bird merchants from catching them, all would be right; and almost every bush and tree would have its chorister. 'If you could give any hints as to the next best quadruped to the weasel for keeping in gardens, or, in fact, anything relative to keeping down insects, it would be of very great use.' I know of no other quadruped. The barn owl is a great consumer of slugs; and the lapwing will clear a garden of worms. Our singing-birds are the best for destroying soft-winged insects. The windhover hawk is excellent for killing beetles, and also for consuming slugs and snails. Cats dare not attack him, wherefore he is very fit for a garden, and is very easy to be obtained. I could send you a dozen any season. Were I now a writer in the 'Magazine of Natural History,' I would not agree with a Master Charles Coward in his paper on 'the carnivorous Propensities of the Squirrel.' (See the 'Magazine' for 1839, p. 311.) And so this keen observer has found out at last that squirrels in confinement are occasionally carnivorous animals. Indeed! And so are my hens in confinement: they will kill and swallow a mouse in the twinkling of an eye; and a tame parrot will perform the same feat. All our granivorous birds in confinement will eat raw and cooked meat. My black cat 'Tom,' which is fed and pampered by my sisters, will often turn up his nose at a piece of good roasted mutton, and immediately after will eat greedily of dry bread. What would you think of me were I to write for you a paper in which I would state that the cat is occasionally an animal that is very fond of bread? You cannot judge of the real habits of an animal when it is in captivity. The want of exercise, the change of economy, the change of food, and the change of habit altogether, tend wofully to change the very nature of the stomach, and cause it to accommodate itself to aliment which it would never touch in a wild state. We see people out of health eating chalk; and we see others again, who spend their lives in sedentary employments, loathing food which is very palatable to him who passes the day in the open air. Thus, the ploughman will bolt fat bacon by the cubic inch, whilst the tender young milliner will turn sick at the very taste of it. I myself cannot bear melted butter; but I can and do often thrive, by preference, on a hard crust of bread. Still this would not be the case with one of your London aldermen, who would turn up his nose at the gifts of Ceres, unless those of Nimrod and Bacchus appeared on the same festive board. The squirrel, in the state of liberty, lives on nuts and seeds, and on the tender bark of the Lime tree, &c.; but rest assured that it never touches flesh, or kills birds, or sucks eggs. The shepherds of Wiltshire, who have backed Master Charles in his important discovery, deserve a birch rod. These rural sinners, both young and old, would swear that the moon was made of Jones's lucifers, if you would give them a quart of ale apiece. All my labourers believe that the heron thrusts its legs through the nest during incubation; and they will all tell you that the cuckoo becomes scabbed at the close of summer. 'As scabbed as a cuckoo.' This, by the way, comes from the mottled appearance which the plumage of the bird puts on at that time of the year. It is caused by the growth of the adult feathers amongst the chicken feathers. I pity the poor squirrels from my heart. Our country squires will now consign them over to the tender mercy of their gamekeepers, and we shall hear of squirrels shot by the dozen. The squirrel is a most harmless animal, except in a nut orchard, from which he ought to be expelled without loss of time, as the damage which he does there is incalculable; but I would trust him for ever in a butcher's shop, provided he were allowed to go and take his breakfast and dinner in the neighbouring woods. I can see the squirrel here just now, living entirely on the seeds of the cones of the spruce firs; I can see him in the very trees which contain nests of ringdoves, thrushes, chaffinches, and blackbirds. Still the owners of these nests betray no fears on his approach; and he himself shows no inclination for raw eggs, young or old birds, whereon to make a meal.—*Charles Waterton, Walton Hall*, June 3, 1839."

Vanilla.—We understand that M. Neumann, the gardener who has the management of the hothouses at the Garden of Plants, has succeeded in obtaining a crop of Vanilla. His plant is reported to have produced 107 ripe fruits, the pulp of which was of exquisite flavour and perfume. The plant itself is said to have suffered, but whether or not from overbearing is not ascertained.

New Ribes.—We have just received from Mr. Lowe of Clapton a specimen of a new hybrid Ribes, which is likely to prove a valuable addition to our collection of hardy shrubs. It was raised by Mr. Beaton from seeds of Ribes sanguíneum, fertilised with the pollen of R. aúreum, and partakes equally of the properties of both parents; the flowers being of a reddish yellow colour, more slender than those of R. sanguíneum, while the leaves bear a strong resemblance to those of R. aúreum. In its mode of growth, however, it widely differs from both, being of a much more erect and graceful habit; bearing its flowers with that profusion which is so beautifully characteristic of R. sanguíneum.

Bokhara or Candahar Clover.—A specimen of this plant (Melilotus leucantha) was exhibited last August at a meeting of the Yorkshire Agricultural Society, by Mr. Stickney, who states "that, if allowed to flower, it becomes biennial; and that a single plant, in rich soil, kept clear of weeds, will cover a circle of two yards in diameter, and attain the height of fifteen feet. It dies down in the autumn, and in the spring shoots out again from the crown. Horses and all kinds of cattle eat it freely, either in a green or in a dried state. It may perhaps prove useful in alternate husbandry; as it produces a great weight of herbage, and has at the second cutting in September attained the height of two feet. In its native country its bark is used instead of hemp." It is our opinion, however, that this, like all other Melilots, is coarse, and only fit to be cultivated where better plants cannot be obtained.

GARDEN MEMORANDA.

Rollisson's Nursery, Tooting.—In the Orchidaceous house we observed in flower Cattleya Móssiæ, Maxillária variábilis and Déppei, Dendróbium secundum, D. pulchellum, and Vanda cristata. The latter was exhibited at the Horticultural Society's rooms two months since, and is valuable for the length of time it will continue in bloom. Also Oncídium Phelpsiánum, the flowers of which are brighter and of a deeper colour than those of Oncídium altissimum; Dendróbium cærulescens, which has been flowering at intervals for the last four months, and very much resembles D. nóbile; Camarotis purpúrea, of a delicate lilac and purple colour; Acanthophippium sylhetense; Calanthe bícolor, from Japan, said to be hardy, whose flowers are brown, with a whitish lip; and an entirely new species from the Straits of Malacca, with much the habit of a Dendróbium—the perianth is white, column yellow, and the labellum marked with three brownish stripes: many of the plants are growing upon cork, which has a much neater appearance than blocks of wood. In this house are a fine plant of Combretum macrophyllum, covered with its bright crimson heads of flowers, and the singular Ceropégia stapeliæformis. In the stove is a new species of Amaryllis, called A. Sweetii, having been raised from seed by the Rev. Dr. Sweet, of Bristol: it rather approaches to A. formosíssima, but the flowers are darker, and not in the least banded or striped. Here also is the original plant of Æschynanthus maculatus, loaded with a profusion of its scarlet blossoms. Amongst the Heaths are Erica dilecta, much resembling múndula; E. fragrans, fimbriata, pinea purpúrea, and a newly-introduced one called fastigiata lutescens; the flowers are greenish yellow, and the habit very compact. At the back of one of the houses are some Tríllíums, Cypripédiums, and other American roots, planted in a border of peat, and covered with sphagnum, where they are found to succeed remarkably well. In the pits are some fine bulbs of Lílium speciosum, in pots, just commencing to make vigorous growth. A large plant of Glýcine sinensis is enlivening the show-house with its beautiful festoons of flowers, extending the whole length of the back wall, and over a part of the roof. Here we noticed two excellent seedling Rhododendrons, one a delicate pinky lilac, with yellow spots in the throat; the other a variety of Smithii, but much more deeply marked. Another seedling, named R. Albertus, raised between catawbiense and cinnamomeum, was nearly out of flower; this is a light blush, with fine dark spots. All three are perfectly hardy. Among the Azáleas was a semi-double one, of a bright rose colour, and perfectly distinct from any of the other double varieties. A curious Nemóphila, with flowers nearly black and edged with white, and a cruciferous plant, with sweet-scented delicate lilac blossoms and dentated leaves, are amongst the other novelties now in bloom. Out of doors, Magnólia Norburti, a variety between conspícua and purpúrea, and Bérberis dulcis, which proves to be quite hardy, are flowering profusely.—*R. A., April* 25.

Bodmin, Cornwall.—This is, I believe, generally considered one of our mildest counties, and such, in winter, it very likely is; but I much doubt whether our summers are so hot, or our springs much earlier than in the vicinity of London. With regard to the latter, I will just name the state of forwardness of some flowers and fruit-blossom at this present time, April 20th, which may be compared with what it is elsewhere. We have had a week or ten days of very cold E. and N.E. winds, with hoar-frost by nights; but to-day it has been very warm, and the wind, though strong part of the day, a little more to the S.E. As regards vegetation, however, the Whitethorn is in leaf; Vines are shooting in the open air: Elder flowers are appearing, with flower-buds smaller than Peas. A Wistaria against my house, south aspect, is showing its beautiful lavender-coloured flowers. Some common monthly Roses, in the same situation, are in flower; and large flower-buds are appearing on La Marque. Plums, Cherries, and Pears are in full bloom, while Apple blossom is just appearing. A flower of Keen's Seedling is to be seen here and there, but common Hedge-Strawberries are fully out. Gooseberries and Currants are also in blossom, and a few Anemones are to be met with in the woods.—*α. β. γ. April* 20.

Reviews.

A Treatise on Agriculture. By John Sproule. Dublin: Curry. 8vo.

This is a compilation from a variety of writings on subjects more or less intimately connected with agriculture. It forms an octavo volume of 710 pages, has a good index, and treats on the following subjects:—Commencing with soils, the author describes their nature and formation, composition, and classification; points out the manner in which their qualities are indicated by their spotaneous productions, and the means of increasing their productive powers. Manures he divides into three classes, organic, inorganic and mixed; but without entering into any relation of their chemical mode of action, he enumerates their different natures and properties, and their manner of application. To his description of the implements of the farm, Mr. Sproule has added figures of those most approved for preparatory tillage, as well as for sowing, thrashing and preparing grain. With his account of the buildings of the farm are plans of farmeries and the different uses for which they are best adapted, with the most convenient method in which the whole may be arranged. He then proceeds to point out the principles to be observed in enclosing land, and the manner in which fences should be constructed; with the list of operations preparatory to tillage, such as draining, fallowing, &c., which are too often neglected. One chapter is devoted to the structure of plants, in which the author traces the functions of the elementary organs, concluding it with a few general observations on the manner in which plants are nourished, how far they are dependent on the atmosphere for food, and to what the cause of the ascent of sap should be attributed. Having treated of the vegetable structure, and the phenomena of its growth, maturation, and decay, he next proceeds to consider the order in which a succession of crops may be obtained, to enable the cultivator to derive the greatest amount of produce from his land. The five succeeding chapters treat upon the cultivation of those plants which may be said to belong particularly to the farmer. The first is devoted to the Cereal grasses, the second to those plants which are cultivated for their roots and leaves, with a table showing the proportionate nutritive products of the various plants described in this section of the work, namely—the Potato, Swedish Turnip, Common Turnip, Beet, Carrot, Parsnep, and Cabbage. The remaining chapters refer to the culture of Leguminous plants, to such as are grown for the sake of their fibres, and to the culture of Forage and Herbage plants, in which those are mentioned which are most likely to be beneficial to the farmer. Nearly one-half of the work relates to the management of Grass lands and live stock; the internal structure of animals is described, with observations on the improvement of breeds, and the manner of rearing and feeding them. The species and varieties, anatomy and diseases of each particular race, are separately treated of, and the chief veterinary operations which it is incumbent upon every farmer to be acquainted with. The volume concludes with the amount of capital required in farming, and the average expenses and produce of a farm. We regard the work as a useful contribution to a farmer's library.

The Encyclopædia Britannica. 7th Edition. Black. 21 vols. 4to.

We cannot do otherwise than notice the completion of this very important work, which is beyond all question the most valuable collection yet formed in English of treatises on science and literature. The names of Arago, Herschell, Napier, Playfair, Mackintosh, Dugald Stewart, Barrow, Brewster, Walter Scott, Leslie, Hazlitt, Wilson, and a host of others, each occupying the highest station in his own department of knowledge, indicate the class of writers whose services have been secured by the Publishers of the Encyclopædia Britannica; and a most copious Index, just issued, itself forming a 4to volume of 162 pages of very closely-printed matter, serves to show the great diversity of subjects to which those eminent men have addressed themselves. By means of this Index the Encyclopædia Britannica now contains all the advantages of an alphabetical arrangement, and of special treatises, to each of which, by themselves, there are objections. Among the contributions to those subjects which properly concern the *Gardeners' Chronicle*, we remark dissertations on *Agriculture*, by Cleghorn; *Vegetable Anatomy*, by Ellis; *Animal Kingdom*, by Wilson; *Ant and Apiary*, by Roget; *Geology*, by Phillips; *Physical Geography*, by Traill; *Planting*, by Loudon; *Poison*, by Christison; *Vegetable Physiology*, by Ellis and Balfour; *Ventilation*, by Reid.

CALENDAR OF OPERATIONS *for the ensuing week.*

So long as the hot and excessively drying weather continues, newly-planted trees which are of much value, and especially evergreens, imperatively require the assistance of some of the protective means mentioned at p. 208. Removed wall-trees which were only scantily furnished with roots, and are now either dormant or pushing weakly in consequence, should be screened from the sun in the hottest part of the day by hanging mats before them; they should also be freely washed by the garden engine every morning and evening. By a little extra labour in this way, the life of many a fine tree might be saved.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Small Pine-plants make considerably greater progress when planted out on beds of soil, or a hotbed of bark or leaves, than when their roots are confined in pots. Those, therefore, who desire to hasten the growth of their youngest plants, and have the necessary convenience, may find it advantageous to adopt this plan. To maintain a lasting warmth, a large body of fermenting material will be required, of which the upper portion ought to be partly exhausted, as a preventive of violent heat. The bed should be kept well up to the glass, and covered with 8in. or 9in. of soil, which will be deep enough for small plants such as are here alluded to. In putting them out, let them have plenty of room, as they will not be again removed till potted in autumn. Fruiting plants that are just showing are sometimes planted out in the same way, when they swell their fruit to a larger size than they would have done in pots. Such as are not yet re-established should be shaded in hot sunshine.

Vinery.—Grapes that are ripe will not require fires at night while the weather is dry, but when rain comes it will be advisable to resume them so far as is necessary for the prevention of damp. The Frontignans should be used first, because in hot weather these sooner shrivel than the Hamburgh or the Muscadine; to prevent this, the Vines may be partially shaded by a doubled net after the fruit is quite ripe. Shut up the later houses soon in the afternoon, and very little fire will be required except in cold nights. Look vigilantly after red-spider during this weather.

Peach-house.—Expose the ripe fruit freely to the sun and air, by drawing down the lower range of lights (which ought to be made moveable in Peach-houses) every fine bright day. Some method should also be adopted to prevent the fruit which fall off from being bruised. Nets slung by numerous ties to the trellis upon which the trees are trained, is perhaps the most efficient plan. Use the garden engine daily in all the successional houses, and shut them up warm, except where the fruit is stoning. These will only require fires in cold nights.

Cherry-house.—Give all the air possible to ripe and ripening fruit. Use no more water than is needed, and keep the atmosphere of the house dry. The trees in the second house, the fruit of which will now be swelling rapidly, must have a liberal supply of water both at root and top.

Fig-house.—If the fruit in this house has reached the critical stage alluded to at p. 224, a uniform system of management must be carefully followed, as at that period of its growth improper excitement or a sudden check would be alike fatal to the crop. Keep the borders moderately moist, and do not give a great quantity of water at one time; that which is given should not be cold and hard. Be more moderate also in syringing; in fact, excess in every way must be cautiously avoided.

Strawberries in pots require plenty of water in hot and dry weather, such as we have lately had; they ought to be looked over morning and evening.

Cucumbers and Melons.—Bright and warm weather at this season does not make linings unnecessary; on the contrary, a moderate bottom heat ought to be kept up in expectation of a sudden change to cold and dulness, by which the productiveness of the plants would be materially diminished if there was no bottom heat in the beds. Cucumber-plants in bearing require a liberal supply of water in sunny weather; they should likewise be sprinkled overhead in the afternoon when the air is finally taken off. In sprinkling Melon-plants, avoid wetting the base of the stems; too much moisture at that part invariably causes canker in the more tender sorts. Nets, or leafy branches, laid thinly over the lights in hot days, would be beneficial to the plants.

Celery.—Continue to prick out on dung as the plants become large enough; they must also be well supplied with water. Thin out and water regularly all young vegetables that are growing in frames.

Kidney-Beans.—Sow in pots, or thickly in boxes, for planting out, in case of failure of the first sowing in the open ground.

Out-door Department.

Young vegetables of all kinds must be regularly watered during the continuance of the drought. After watering transplanted crops, such as Cauliflowers or Cabbages, draw a little mould round the stems. This will prevent the quick evaporation of the moisture, and one watering will be as serviceable as two without that precaution.

Asparagus.—All the shoots, both large and small, ought to be cut off for a time; if the weak shoots are permitted to run up too early, many of the backward buds on the roots will not break, and its season will consequently be shortened.

Borecole.—Sow another bed, for a late spring supply; likewise a small quantity of Brussels Sprouts. Clear away the old stalks as they run to flower.

Broccoli.—Take advantage of the first rain to sow the principal crop of late sorts. As the heads come into use they should be shaded from the sun, by turning some of the leaves over them; or a part of the best might be taken up and laid in a cool shed.

Cardoons.—Sow another row or two.

Endive is in some families required early; where such is the case a little seed may be sown now, but the plants will be very likely to run before winter.

Kidney-Beans.—Put in some Scarlet Runners. If these are sown in rich soil, their produce will be much more abundant, and less ground will be needed. A small white Runner, from Holland, the seeds of which are edible, will be found exceedingly useful in large families, as it makes a good winter dish.

Leeks.—Sow a small bed for a late supply.

Peas.—Sow a succession. The Milford Marrow, and Woodford's Marrow, sown now, will be ready for table in 12 or 13 weeks; Knight's Dwarf Marrow requires a fortnight longer.

Spinach should always be sown between the rows of Peas; or if that quantity does not give a sufficient supply, sow between the rows of Beans as well.

Sea-Kale.—Take away the covering as the Kale is used, and dig between the stools.

Turnips.—Thin the young plants before they get so large as to crowd each other.

Orchard.—Strawberry plants are now putting up their flowering stems, and will require watering, in dry soils especially. Give them a thorough soaking, for a slight sprinkling will be of little service. Continue the regular disbudding of wall-trees. If aphides are found, moisten the young shoots, and then dust them with snuff. Grafted trees would be benefited by occasional sprinklings with the garden engine.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Very little fire-heat will now be required; take care that the fires are put out, and the flues or pipes cooled in the morning, when the day is likely to be warm; give air freely, but shut up early in the afternoon. Strong-growing plants will be apt to injure the weaker kinds, if not kept under by training and pruning. Top the shoots of Euphórbia jacquiniflora, to make them bushy, and put in cuttings of it; they will flower beautifully next winter.

Greenhouse and Conservatory.—The Conservatory borders should be well watered about once a week, independently of the syringing of the plants. In the Greenhouse, likewise, constant attention must be paid to watering; most of the plants requiring a liberal supply now. The necessity for these frequent waterings may be obviated by fixing a screen of thin canvass upon the roof of the house, to work on rollers, so that it might be readily let down in very hot sunshine. Besides the saving of labour, such a screen would be of great service to delicate plants; it might also be used with advantage in prolonging the bloom of Pelargoniums, Calceolarias, &c. Let the best plants have plenty of room, by removing those of less consequence to some place of temporary shelter. When there is no danger of frost, some of the sashes may be left open all night. Be vigilant in keeping down the green fly.

Pits and Frames.—Whenever the weather permits, all plants intended for beds in the flower-garden should be exposed both night and day. Many things will now bear the open air, if set in a sheltered place. Upon the recurrence of favourable weather for planting, annuals in pots or frames should be put out: in the mean time, keep the plants thin, and regularly watered. Sow Cockscombs, Balsams, Globe Amaranths, and other tender annuals, for decorating the houses late in summer.

Out-door Department.

While the drought continues, the planting out of annuals, &c., cannot be done with advantage, but every preparation ought to be made. Persevere in eradicating the unsightly weeds mentioned at p. 240. If one Dandelion is suffered to shed its seed, plants enough to stock half the lawn will be its produce. Look over Rose-trees now and then, and suffer no suckers to rob or grubs to disfigure them. Grass-seeds may be sown at any time, and the first rains will bring them up. Mowing will now be generally necessary, but where the grass is weak it should be put off as long as practicable.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Grafted trees of valuable sorts might be earthed up to keep them cool, leaving only an inch or two of the graft uncovered; a watering now and then will assist them. Look over budded stocks, and rub off all robbers. Transplanted seedlings of choice things should be regularly watered.

Forest and Coppice Woods.—Persevere in felling and peeling Oak timber and coppice, and take advantage of the fine weather to dry and house the bark.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending April 28, 1842, as observed at the Horticultural Garden, Chiswick.

April	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.
Friday 22	29.994	29.899	66	36	51.0	N.E.	
Saturday 23	29.901	29.878	75	37	56.0	N.W.	
Sunday 24	29.948	29.931	75	37	56.0	S.E.	.01
Monday 25	30.028	29.946	73	42	57.5	E.

Average	29.995	29.937	70.0	36 7	53.3		.01

April 22. Foggy; dry haze; clear and fine.
23. Very fine; clear at night.
24. Very fine; thunder-storm in afternoon, with partial showers of rain; at some places in the neighbourhood of London very heavy, with hail so large as to break glass.
25. Light dry haze; very fine; clear.
26. Very fine; clear and dry with brisk wind.
27. Fine; air exceedingly dry; clear at night, with slight frost.
28. Light haze; hot and dry; clear and fine.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending May 7, 1842.

May.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 6th, 1830—thermometer 81°; and the lowest on the 6th, 1831—thermometer 28°.

REPORT ON COVENT GARDEN MARKET,

For the week ending April 29, 1842.

The late fine weather has increased the supply of almost all kinds of vegetables; hothouse fruit is also more plentiful and of a superior quality. Trade, on the whole, has been much brisker than during the preceding week. *Fruit:* The price of Pines is lower than in our last Report, from 8*s*. to 12*s*. per lb. Forced Grapes are not scarce; many excellent samples of Hamburgh are offered, and a few Muscats, at from 6*s*. to 15*s*. per lb. Peaches and Nectarines are not plentiful, they fetch from 15*s*. to 30*s*. per doz.; and the few Cherries to be met with are sold at 30*s*. per lb. Pears are rather scarce, and fetch from 3*s*. to 9*s*. per doz. The supply of Apples has been very good; the prices both of dessert and kitchen kinds are the same as in our last account. Strawberries are plentiful, from 6*d*. to 1*s*. per oz. Plenty of Cucumbers may also be procured, but their price still continues the same. *Vegetables:* During the past week Broccoli has been very abundant, from 1*s*. to 2*s*. per bunch. The supply of natural Asparagus has likewise been on the increase; its price is rather lower than in our last Reports, being from 8*s*. to 12*s*. per 100. New Potatoes are far from being plentiful, and are selling from 2*s*. to 4*s*. per lb. French Beans still continue high in price, fetching from 2*s*. to 3*s*. 6*d*. per 100. Seakale and Endive are becoming more scarce. Lettuce is more abundant, and good Cos may be obtained from 2*s*. to 2*s*. 6*d*. per score. The supply of Rhubarb is increasing, and fetches from 10*s*. to 12*s*. per doz. bundles. Mushrooms are also plentiful from 1*s*. to 1*s*. 6*d*. per pottle. Amongst the cut flowers we observed some beautiful Cinerarias, Auriculas, Moss Roses, Calceolarias, Azaleas, Cloves, and Ericas.

PRICES, Saturday, April 30, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 6*s*
— Dessert, per bushel, 4*s* to 12*s*
Pears, dessert, per half-sieve, 4*s* to 16*s*
Strawberries, forced, per oz., 6*d* to 1*s*
Peaches, per doz. 15*s* to 30*s*
Nectarines, per doz., 15*s* to 30*s*
Pine Apple, per lb. 8*s* to 12*s*
Grapes, hothouse, per pound, 6*s* to 15*s*
— Spanish, per lb., 1*s* to 2*s* 6*d*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 6*s* to 18*s*
— Bitter, per 100, 7*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Cucumbers, per brace, 2*s* to 6*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 9*s*
Walnuts, per bushel, 16*s* to 24*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Cabbage, Red, for pickling, 3*s* to 9*s*
Cabbage Plants, per doz., 3*s* to 6*s*
Broccoli, White, p. bnch., 6*d* to 1*s* 6*d*
— Green, 9*d* to 1*s*
— Purple, 9*d*
— Sprouts, per sieve, 1*s* 6*d*
Kidney Beans, forced, p. 100, 2*s* to 8*s*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
— New, per pound, 2*s* to 4*s*
Turnips, young, per bunch, 2*s* to 3*s*
Carrots, per doz. bunches, 5*s*
— young, p. bch., 1*s* 6*d* to 2*s* 6*d*
Parsneps, per dozen, 9*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 6*d* to 1*s*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s* 6*d*
Chives, per pot, 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb. 1*s*
Shallots, per lb., 2*s*
Onions, per half sieve, 4*s*
— for pick., per hf.-sieve, 4*s* to 5*s*
— Green, per doz. bches., 2*s* to 4*s*
— Spanish, per dozen, 1*s* to 3*s*
Asparagus, per 100, large, 10*s* to 14*s*
— Second or Middling, 6*s* to 8*s*
— Sprue, or Small, 3*s* to 5*s*
Sea-kale, per punnet, 1*s* to 2*s* 6*d*
Lettuce, Cabbage, p. score, 6*d* to 1*s* 6*d*
— Cos, per half sieve, 1*s* to 4*s*
Endive, per score, 1*s* to 2*s*
Celery, per bundle (12 to 15) 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per dozen bunches, 2*s* to 4*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Mint, per dozen bunches, 2*s* to 4*s*
Marjoram, per bunch, 6*d* to 1*s*.
Basil, per bunch, 6*d* to 1*s*
Rhubarb Stalks, doz. bundles, 5*s* to 12*s*
Victoria Rhubarb, bund., 1*s* 6*d* to 2*s* 6*d*
Mushrooms, per pottle, 1*s* 3*d* to 1*s* 6*d*

Notices to Correspondents.

J. S.—By an oversight, Clematis azu'rea grandiflora was mentioned in p. 257 as a proper plant to be exhibited at the Horticultural Society's Garden, amongst Greenhouse Climbers. As it is perfectly hardy, it is in reality inadmissible.

Rosabel.—Humble-bees cannot be kept in hives like the common bees.

Mask.—Rust on Grapes is frequently occasioned by persons thinning them with hands covered with perspiration; this appears to be the case with yours. In thinning Grapes, one principal object is never to handle the berries if it can possibly be avoided.

T. T. H.—Campanula pyramidalis will bloom more than once if planted in the open ground; but the second flowering is never so good as the first. Liquid manure will assist the plants greatly. By Gas-liquor we meant the water in which gas has been purified, and not gas-tar. It is impossible to say how much should be mixed with a cart-load of leaves, as so much depends upon the strength of it.

M. W. K.—Your Box was planted at the wrong season of the year; instead of being planted in October, it should have been deferred until April. Its sickly state is owing to its not having formed fresh roots before the frosts set in. Your only chance of preserving it is to water it well during this continued dry weather, but not while the sun is upon it. The sulphuric acid recommended to be mixed with liquid manure is common oil of vitriol.

Ignoramus.—The Arauca'ria imbricata is a native of the Cordilleras, in South America, where the female is stated sometimes to attain the height of 150ft., while the male seldom grows to more than one-third of that altitude. The trunk is quite straight, without knots, and covered with double bark, resembling cork, of nearly a foot in thickness, from which resin flows in great abundance. In young trees the leaves remain attached to the stem for 12 or 15 years. The branches are produced in whorls, spreading out horizontally, diminishing in length as they ascend, and terminating at the top in a pyramidal head. The flowers are produced in catkins—male and female upon separate trees. The cones are globular, from three to four inches in diameter, each of which contains from 200 to 300 kernels, similar to an almond; these constitute the principal food of the Araucano Indians, who eat them either fresh, roasted, or boiled. The wood is yellowish-white, of a fibrous nature, full of beautiful veins, and capable of being polished and worked with facility; it is also stated to be well adapted for ship-building. It is generally raised from seeds, and is perfectly hardy in this country. When first planted out, it is liable to be injured after frost, by being suddenly thawed; it is therefore advisable, in winter, to place something before it, to screen it from the direct rays of the sun. It prefers a bleak, exposed situation, to a warm or sheltered valley; many plants in the severe winter of 1837-8 were destroyed in the latter situation; while in the former, others remained perfectly uninjured. The largest plant in England is at Kew, which, as well as that at the Horticultural Society's Garden, has stood latterly without protection.

Ranz.—It does not matter whether Gypsum, in the form of plaster of Paris, has been made to set by water before using it or not. It will answer the purpose of fixing ammonia equally well if it is broken down again into powder. The effect of burning gypsum is to expel its water, when it becomes plaster of Paris. But the depriving it of its water does not destroy its nature as sulphate of lime, or prevent its acting chemically as a means of preventing the escape of ammonia. Broken plaster casts and images, if reduced to powder, will act just as well as fresh gypsum.

X. Y. Z.—From your statement concerning your Turnips, we should conclude that both the sorts and the manner of cultivation require improvement. Seed saved by cottagers in small gardens, a small quantity at a time, with different sorts near them, can never produce genuine varieties. It would be better to procure seed from some respectable seedsman. We believe nothing has been found to answer as a manure for Turnip better than farm-yard dung, provided there is enough of it, and it is of good quality: if, however, owing to circumstances, you are unable to procure as much as you want, it would be worth your while to try guano, applied at the rate of 1 cwt. to the acre, in wet weather, so as to insure its being quickly washed into the ground. Being a fine powder, this substance can be sown broadcast without difficulty.

Sparrow-grass.—There is no doubt that the contents of the cesspool would be better if purified by the addition of gypsum or weak oil of vitriol, until the offensiveness of the contents is destroyed. Tussilago fragrans is quite hardy, and will grow in any kind of soil. Your Asparagus-beds are fit for nothing but to be destroyed. For other answers see a leading article of to-day.

Carnation.—Spirits of Tar are by far the best preventive against the attack of insects upon Carrots; its manner of application is described in p. 105 of last year's *Chronicle*. There is not the least doubt but it would act as favourably upon Onions, which would, however, be benefited by changing the ground every year on which they are grown.

J. J.—The curling or blistering in the leaves of Peach-trees is not produced by insects, but by the late cold winds; the only remedy we can suggest is to shelter the trees as much as possible from their effects.

H. H.—We thank you much for the specimens; but we are of opinion that the case you have found is not that of a Cucumber growing on a tendril; we should call it a Cucumber growing from the axil of a tendril, which has adhered to the stalk of the fruit. It would be tedious to point out the difference between these cases, and you are probably well acquainted with it. The latter is, as you know, not at variance with recognised laws of structure, although no doubt unusual; the former would be very unintelligible. The Pansies were much shrivelled; but although pretty flowers, we think we may say they are too small to be prized. The Apple is the Easter Pippin, or French Crab.

Reclusia.—The Nocera Onion and Artichoke-leaved Lettuce are at present confined to the nurseries about Paris, and will, no doubt, be introduced into this country next spring. The Potato you mention is probably the Small Mouse or Curaçao Potato, which may in another year be obtained from the Horticultural Society's Garden, through the Fellows.

E. H. Fuller.—Your Kennédya is certainly a fine-coloured variety of K. racemosa, but we shall not have an opportunity of figuring it in the Register.

G. B., Limerick.—Will you tell us, for the information of a correspondent, whether the Clianthus puniceus you mentioned (p. 269) stood out during the winter of 1840-41?

C. M.—Asparagus-beds will not be injured *now* by sprinkling Salt over them, but it must be done in very trifling quantities at a time.

R. C.—The large Eucalyptus is probably E. obliqua; the other it is impossible to name without a flower. The plant resembling an Equisetum is Casuarina equisetifólia.

Potentilla.—Aristolóchia Sipho and A. Clema'titis are both hardy; the former will flower freely either trained to a pole or against a wall. "Mrs. Loudon's Ladies' Magazine of Gardening" has ceased to be published.

Radford.—The term of a "semi-oblate spheroid," as applied to the form of the Tulip, did not originate with us, but with Mr. Groom; an Orange will, perhaps, convey the best idea of an oblate spheroid; meaning, in reality, a sphere with the poles flattened. Divide this horizontally into equal parts, and you will have a semi-oblate spheroid.

C. D.—You cannot do better than reduce the balls of your sickly Orange-trees, and repot them into sandy loam, mixed with a small quantity of charcoal and a good proportion of well-decomposed manure. Prune in the heads of your plants a little, and place them in a warm house until they begin to grow freely; syringe them frequently, and allow them plenty of air. To get rid of the scale, wash or brush them over with strong soap-suds, and not with *glue-water*, which would choke up the stomates of the leaves, and thus produce a worse effect than the insect. Mimosa arbórea is tender; Gledítschia triacanthos is hardy. "Paxton's Botanical Dictionary" is one of the best catalogues for your purpose.

J. B. Warren and *E. F. L.*—The blotches on the leaves of your Pear-trees do not appear to have been caused by insects, but by excessive cold at an early stage of their growth. We are not aware that Guano dissolved in water has ever been applied to Vine-borders.

A Practical Amateur.—Repot your Chorozema va'rium into a mixture of loam, peat, and sand; water it freely, and let it have plenty of light and air. Your Poly'gala may be treated in the same manner, but do not mix quite so much loam with the compost. After Epacris grandiflora has flowered, repot it into sandy peat, and stop the shoots occasionally as they become of sufficient length; this will cause them to become more bushy and flower more freely. The following are Sweet-scented Greenhouse Plants:—Aloýsia citriodora, Daphne odora, Gardénia rádicans, Jasminum grandiflorum, Lucúlia gratíssima, Heliotrope, and Common Orange, of which the Brigadier multiflora is one of the best.

P. M.—We never heard before of such a book as the "Jardin des Plantes." We scarcely understand your question as to whether certain plants extend themselves in the direction of the longitude. The Dog Rose (R. canina) is found in England, and reaches as far south as Calabria. Prunella vulgaris may be found wild from Edinburgh to Hobart-town, in Van Diemen's Land. Is this what you want to know?

Radford.—We know of no means of killing Red Spider on Gooseberry-trees, except by the fumes of sulphur and lime, heated on a brick or other such substance.

J. J. S.—Dissolve a quarter of a pound of Nitrate of Soda in a gallon of water, and pour it over the soil in which the Fir-trees are growing; not over the leaves, which it will bring off. If no effect is produced in a week, repeat the dose.

W. R.—The Beechwood Melon is a green-fleshed sort, and the best we know. It requires no other than the most ordinary care.

J. N. V.—We regret extremely that we have not the means of procuring a single copy of the *Gardeners' Chronicle* for last year. Some of them will probably be heard of by-and-by in book sales. Your letter shall be attended to next week.

D. M.—Your Zichyas are beautiful; they are the Z. tricolor. The Cinerarias are pretty, but not better than others.

J. L. C.—It is the heat of your stone flues which creates such a dryness in your house, notwithstanding all your attempts to keep it moist. By the "point of saturation" is meant that state of the atmosphere when it can hold no more moisture in a state of suspension, without being visible either in the form of vapour or rain. Your plant was not Brássia caudata, but Aspásia variegata.

Cephisus.—Your largest Narcissus was N. aurantius; the smaller one, with the corona divided, N. semipartitus; and the other, N. minor.

Fool's Parsley.—It is only some of the more tender kind of bulbs which require to be left partially naked when potted or planted; the hardy kinds should all be planted below the surface.

J. M.—Your question can only be inserted as an advertisement.

Salopian's plant is Andrómeda polifólia.

J. B.—Your specimen is Eucalyptus robusta.

α. β. γ.—We know of no florist from whom you can obtain cuttings of Pelargoniums.

Cholæus.—No. 1 is Adonis vernalis; 2 is Orobus vernus.

H. H.—Any of the undermentioned Pansies which are not in your possession will improve your collection:—

Thompson's Eclipse.
" King of Beauties.
" Corona.
" Chevalier.
" Prince Albert.
" Azurea.
" Delicata.
" Vivid.
" Flora superb.
" Beauty of Bucks.
" Miss Stainforth.
" Jehu.
May's Imogene.
" Goldsmith.
Brown's Curion.
" Countess of Orkney.
" Jewess.
Cook's King Edgar.
" Joan of Arc.
King's Alert.
Widnall's Waverley.
" Jessie.
Silverlock's Prince Albert.
Gaines's Tippoo Saib.

E. Hopper.—We are much obliged, but have frequently seen Melianthus major in flower.

X. X. X.—Two correspondents employing the same signature necessarily produces confusion.

D. X.—"Don's Gardening" consists of four volumes only, in which but a part of the flowering plants are comprehended. It will never go any further. Some such receipts as you write for have been already given in terms which all chemists can understand, and others are in course of preparation.

As usual, many letters have arrived too late for answers this week.

Errata.—In Mr. Drummond's Advertisement, inserted April 10th, for "buffed" read "cupped," and Weston-road, "Bath," instead of "Butts."

NEWS OF THE WEEK.

Our news from France relates chiefly to the Ministerial movements occasioned by the sudden death of M. Humann, the Minister of Finance; an occurrence which produced for the moment considerable sensation in Paris, and caused a depression in the funds. In consequence of this event, it was feared that the Government might be thrown into serious difficulties, and the existence of the Cabinet endangered; but these anticipations have not been realised, and the appointment of a new minister has been officially announced.—In Spain great excitement has been caused by the interference of the French Government in sending a special minister to London and Vienna, to protest against the marriage of Queen Isabella with any other than a Prince of the Bourbon family. The late proceedings in the French Chambers, during which some severe attacks were made on the Regent, have also been the subject of discussion in the Cortes; all the members who took part in the debate defended the Regent from these attacks; and it seemed to be the unanimous feeling of the Chambers that the pretensions of France should be resisted. In the manufacturing provinces considerable alarm has been excited by Sir R. Peel's speech in the House of Commons in reference to our commercial relations with Spain, and petitions against any treaty for the admission of English cottons have been presented from various parts of the country.—Our German news relates chiefly to the policy of the Prussian Government in reference to the emancipation of the Jews, and shows an increasing spirit of moderation in religious matters; particularly in the long-agitated question of mixed marriages. The French mission to Vienna on the subject of the marriage of the Queen of Spain is said to have been unsuccessful; the Court of Vienna having declined to interfere with the decision of an independent nation, on a subject so important to its interests.—Advices from the Levant announce that all apprehensions of a war between Greece and Turkey have subsided; and there is no doubt that the existing differences will be arranged under the sanction of the Great Powers. A change in the Turkish Ministry is considered certain, in consequence of some divisions in the Cabinet, arising, it is said, out of a note from Sir Stratford Canning, relative to the passage of English troops for India over the isthmus of Suez. The accounts from Syria represent the state of the Lebanon as entirely unsettled, although tranquillity prevails for the moment; the Druses have obtained complete ascendancy, and a renewal of civil war is apprehended.

At home, Parliament is still occupied with the new Ministerial measures; in the Lords, the Royal assent has been given by commission to the Irish Spirit Duties Bill and the Corn Importation Bill. In the Commons, the Income Tax Bill has been under discussion in committee, and all its earlier clauses have been passed without modification. The first schedule, proposing that the Tax should commence from the 5th

April, 1842, and the second, imposing 3½d. per pound in England, and 2½d. in Scotland, on the profits of farmers, taken at half the annual value, were both carried without a division. An amendment was proposed on the next clause, for the purpose of making a distinction in favour of terminable annuities; this was resisted by the Government, and negatived on a division by a majority of 136. Some other divisions have taken place on amendments for the reduction of the proposed tax on professions and trades from *7d.* to *3½d.*; for the exemption of Generals and Flag Officers whose incomes are derived wholly from their services; and for the rejection of the entire schedule; but they were all negatived by large majorities.

Home News.

THE COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. The Queen and Court returned on Monday to Buckingham Palace from Claremont. On Monday her Majesty had an evening party at Buckingham Palace, and on Tuesday honoured the Italian Opera with her presence. The Queen held a Court and Privy Council at Buckingham Palace on Wednesday; and on Thursday there was a Drawing-room, which was numerously attended, at St. James's Palace. The Lord Chamberlain has issued cards for a Ball on the 12th May, at Buckingham Palace. The cards state that those who have the honour to receive invitations are to appear in "costume or full court dress." The Countess of Dalhousie has succeeded the Viscountess Jocelyn as the Lady in Waiting, and Lord Byron has succeeded Viscount Sydney as the Lord in Waiting, on her Majesty.

The Queen Dowager.—Our readers will be pleased to learn that her Majesty the Queen Dowager has so far recovered from the effects of her late serious illness as to be able to leave Marlborough House, and that she has walked in her gardens and taken carriage exercise several days during the week. On Sunday her Majesty attended divine service in the Chapel Royal, St. James's. On Tuesday her Majesty paid a visit to the Princess Sophia, at her residence at Kensington; and on Wednesday visited the Queen at Buckingham Palace. It is stated that her medical attendants have recommended her Majesty to reside at the sea-side during the summer and autumn, and that it is probable she will proceed to the coast of Devon.

Official Appointments.—The Gazette of Tuesday announces the appointment of the Marquis of Bute to be her Majesty's High Commissioner to the General Assembly of the Church of Scotland. It also announces that her Majesty has conferred the Professorship of Pastoral Theology in the University of Oxford on the Rev. Charles Atmore Ogilvie, M.A.; and the Professorship in Ecclesiastical History, in the same University, on the Rev. Robert Hussey, B.D. At the Privy Council held by her Majesty on Wednesday, the Marquis of Londonderry was appointed Lord Lieutenant of the County of Durham, and the Duke of Marlborough Lord Lieutenant of the County of Oxford. The Queen has appointed Francis Merewether, Esq., Immigration Agent in the territory of New South Wales, in the room of J. D. Pinnock, Esq., who is appointed Deputy-Registrar in the district of Port Philip, in the room of Mr. Merewether.

Parliamentary Movements.—The Report of the Ipswich Election Committee, which was brought before the House of Commons on Monday, states that the Committee are of opinion that a system of extensive bribery prevailed at the last election; and on the motion of Mr. Pakington, chairman of the committee, the issuing a new writ was ordered to be suspended for three weeks.—The petition against the return of the sitting members for the borough of Newport has been abandoned.—The Blackburn and Lichfield Election Committees have declared the sitting members, John Hornby, Esq., and Lord Alfred Paget, duly elected.

Foreign.

FRANCE.—*The Cabinet.*—Considerable sensation was produced in Paris on Monday, by the death of M. Humann, Minister of Finance, which took place suddenly on the morning of that day. The first report of this melancholy event caused a depression in the funds to the amount of more than a quarter per cent., and it was feared that it might throw the Government into serious difficulties, and perhaps endanger the existence of the Cabinet. On the fact being communicated to the King, a Council of Ministers was summoned, at which it was agreed that the event ought not to break up the ministry, and the office was offered to M. Hippolyte Passy, who, according to the "Journal des Débats," refused it wholly on personal grounds. The offer was then made to M. Lacave-Laplagne, who accepted it; and his appointment has been officially announced in the "Moniteur" of Tuesday. M. Lacave-Laplagne was Minister of Finance in the Molé ministry. The following are the particulars given by the papers of the death of M. Humann, which has been the subject of general discussion in the capital. It took place at a quarter past 12, shortly before which time Count de Boubers, secretary-general of the Ministry of Finance, had been in his cabinet to submit to him a report relative to the maîtres de postes, and M. Humann had made some corrections in it with his own hand. He had also been engaged on a work connected with the Railroad Bill. The Count de Boubers having retired, he was succeeded by the Viscount de Germiny, M. Humann's son-in-law; and a few minutes after he had left, M. Nouton, the chef du cabinet, entered the room in which the Viscount de Germiny had just left M. Humann sitting, for the purpose of consulting the minister on some official business. He found him dead, lying on one side of his arm-chair, his head supported by the table, and his hand hanging down, and still grasping the pen with which he had been writing. Medical aid was immediately sent for; and an attempt was made to let blood in the arms and other extremities, but without effect. Every resource of medical science applicable to the case was tried, but all was fruitless. The Minister had given audience in the morning as usual, and nothing in the state of his health presented any reason for anticipating such a catastrophe. The examination of the body was performed on Tuesday, and it was ascertained that the cause of death was aneurism. The body, which was afterwards embalmed by M. Gannal according to his process, is to be removed to Alsace for interment.

The Chambers.—The Journals are much occupied with discussing the merits of the Government railway project, an outline of which was given in our last. The subject was to have come on for discussion in the Chamber of Deputies on Monday; but in consequence of the sudden death of M. Humann, it was postponed till the following day. On Tuesday the debate commenced. The Chamber was unusually full, deputations having arrived from all parts of the country to be present at the discussion of the Bill. M. Lacave-Laplagne took his seat on the Ministerial bench, in place of M. Humann. M. Grandin was the first orator; he merely contended for the line from Havre to Marseilles, opposing all the other lines. M. Ganthier de Rumilly then spoke in favour of the Government project. M. Fould, the banker, then addressed the Chamber at great length against the project, asserting that the Government had not provided sufficient means to meet the very large expenditure required. M. Marshal then supported the Bill. M. Carré spoke against it; he was for the line from Havre to Marseilles only. M. Magnier, de Maisonneur, supported the Bill, because railroads would be advantageous to France during war for the prompt transport of troops; he was for the Paris and Belgian line, and the Paris and Strasbourg also. The debate then adjourned. On Wednesday it was resumed by Gen. Paixhans, who demanded—1st, the Paris and Amiens line; 2d, the Chalons and Dijon line; 3d, Orleans and Tours; the other lines to be finished afterwards. Col. Schauerberg gave various stratagetical reasons in favour of the Bill. M. Manuel then demanded that the general discussion should be closed. This was opposed by M. Berryer, and on being put to the vote M. Manuel's motion was rejected. M. de Peyramont then spoke against the Bill, and was followed by M. Bineau. M. Teste, the Minister of Public Works, had intimated his intention to follow M. Bineau; and M. Berryer was expected to reply to the Minister. The general discussion was not expected to be closed for some days. The committee of the budget had named, on Wednesday, M. Darblay president, and M. Vintry reporter, of the budget of exchequer, in place of M. Lacave Laplagne. The report of the latter, which was nearly ready, will not be changed, and the debate will come on immediately after the Railroad Bill.

The Army.—The army has been deprived of two of its most distinguished marshals by the deaths of Marshals Moncey and Clausel, which took place on the same day, the 20th inst.; the latter at his seat in the south of France, and the former at the Hôpital des Invalides, of which he was the governor. The funeral of Marshal Moncey took place on Monday in the Church of the Invalides. Six battalions of infantry and detachments of cavalry and artillery were in attendance. The deaths of these two marshals reduce the number of officers of this high rank to 7, viz., Soult, aged 72; Oudinot, 74; Molitor, 74; Gérard, 70; Grouchy, 76; Valé, 69; Sebastiani, 68. According to the new law regulating the staff of the army, the number of marshals is henceforth in time of peace to be limited to 6.

The Fortifications.—The Minister of War, Marshal Soult, has distributed to the members of both Chambers copies of a report made to the King respecting the progress of the fortifications during the years 1840 and 1841. The report states that the expenses during the year 1840 amounted to 5,000,000f., and in the year 1841 to 25,000,000f., leaving a balance of the sums already voted by the Chambers of 37,000,000f. applicable to the expenses of the current year. The report concludes by stating that the continuous wall and the forts have been executed simultaneously, and that the works will be concluded within five years, the period originally prescribed.

Slavery in the Colonies.—It appears from a recent return to the Minister of Marine, that from Oct. 1841 to Jan. 1842, 452 negro slaves have been emancipated in the colonies of Martinique, Guadaloupe, Guyana, and Bourbon, and that the total number emancipated since 1830 is 38,959.

Naval Movements.—Toulon papers of the 21st inst. inform us that the statement which appeared in most of the journals, and was copied into a former Number of this Paper, that four ships recently returned from Smyrna had been ordered to take in three months' provisions, and get ready for sea, was unfounded. The order applied to the ships in the roadstead, under the command of Admiral Hugon, but, according to the same authority, it has been suspended by a telegraphic communication, and nothing has transpired to confirm the rumour that an expedition is on the point of being sent against Morocco. The journals state that Government are about to despatch the steam-frigate Gomer from Rochefort for the West Indies, being the first of the French Transatlantic steamers which are to compete with the English company. Three commissioners, under the direction of the Inspector of the Finance department, are to proceed with this vessel, for the purpose of organising the packet service throughout the West India Islands and the Spanish Main. The commissioners will proceed first to Port Royal, Martinique, which is fixed on for the principal station. It is expected that on the return of the Gomer the other steam-boats will be ready, and that the Transatlantic communications will proceed regularly and without interruption.—It is stated that in consequence of some vexations experienced by French steamers navigating the coasts of Spain between Marseilles and Cadiz, the Government lately despatched a ship-of-war to Alicant to demand satisfaction, which appears to have been given by the Spanish authorities.

The Capital.—The King and Royal Family left the Tuileries on Monday, to take up their summer abode at Neuilly. The King and Queen of the Belgians and the Prince of Wirtemberg will remain at Neuilly, with their royal relatives, until after the accouchement of the Duchess of Nemours; and in consequence of the near approach of this event, it has been decided that the Duke of Nemours is not to make an African campaign this year.—Private letters received in Paris report that the state of Madame Laffarge continues to get worse. At the trial at Tulle she was noted for the *embonpoint* which her appearance presented; but at present she has fallen away to a state of great emaciation. A commission of medical men, composed of professors of the Academy of Montpelier, has been lately sent by the authorities to examine into her state, mental and bodily. They declared that she is afflicted with mental alienation, accompanied by violent paroxysms, which of late had become so frequent as to render necessary the use of the strait waistcoat. It is said that she is to be transferred to a private asylum at Montpelier.—M. Bertin de Vaux, Peer of France, and one of the proprietors of the "Journal des Débats," died on Sunday, aged 74. He was interred on Tuesday with great pomp, most of the Ministers and noble families of Paris attending the funeral. —M. Pageot, former Chargé d'Affaires from France at Madrid, arrived in Paris on Sunday from Vienna, to which Court he had been sent on a secret mission relative to the marriage of Queen Isabella of Spain.

SPAIN.—We have intelligence from Madrid to the 19th inst. All was then tranquil; and the workmen, whose attempt to disturb the peace of the capital was noticed in our last, had returned to their duty. Some excitement had been created in political circles by the announcement that M. Pageot, late French Chargé d'Affaires at Madrid, had been sent on a mission to the Courts of London and Vienna for the purpose of laying before those Governments the formal protest of France against the marriage of Queen Isabella with any other than a Bourbon Prince. In making this communication, it is understood that M. Pageot disclaimed all pretension to an alliance with any of the sons of Louis-Philippe; but added, that an alliance with any other family than the Bourbons would be regarded by France as a *casus belli*. In the Cortes, the discussion on M. Marliani's proposition relative to certain violent language uttered in the French Chambers against the Regent by the Marquis de Boissy, commenced in the Senate on the 18th inst. All the members who took part in the debate vindicated the Regent against the language used by the Marquis de Boissy; and M. Marliani attacked the French Government, whose conduct he described as denoting an inveterate hatred towards the existing order of things in Spain. He said that M. Pageot was a blind instrument of that hatred, and declared that Spain was not even now at liberty to marry the Queen to a Prince of her choice out of the Bourbon family, without exposing herself to the consequences of war. He contended that the mission of M. Pageot to London and Vienna had no other object than to notify to the Powers the will of France in that respect. He concluded by saying that the relations between the two countries were on a most irregular footing. Spain had a Chargé d'Affaires in Paris, and France had no representative or accredited agent in Madrid, the Duke de Glucksberg being a mere Chargé d'Affaires of the embassy. M. Gonzales, President of the Council, replied that the Duke de Glucksberg was a real Chargé d'Affaires, accredited by France. He spoke with reserve of the conduct of the French Government, but animadverted severely on M. Pageot, who, he said, "had sown division among Spaniards; and previously to his departure from Madrid, had done everything in his power to envenom the relations between the two countries." The House adjourned till the following day, when M. Marliani's proposition was rejected by 76 votes to 1. It was reported that M. Surra y Rull would resign the Finance Department if compelled to present the cotton bill, having pledged himself to the Catalonian Deputies not to bring it forward this year. It seems, however, that there are so many projects of law before the Cortes which claim precedence over that bill, that even if it were presented, it would not be voted this session. The Infante Don Francisco de Paula and his family arrived in Madrid in the evening of the 15th inst. The Capt.-General, the Political Chief, and the members of the Ayuntamiento had gone to meet the Prince on the confines of the province. The next day the Infante waited on the Regent, who received him in presence of the Minister for Foreign Affairs. The journals state that demonstrations of great cordiality had been manifested by those two personages. The Infante and his wife afterwards repaired to the palace, and had a long interview with their nieces, at which the Guardian and President of the Council were present. On the 17th inst. the Regent returned the visit of his Roya Highness, and gave him a banquet at his palace of Buenavista in the evening. The Princes were lodged in an hotel in the Calle della Luna, and a guard of honour of 100 men attended them. They were to stop only a few days in the capital, and to take Aranjuez on their way to Seville, where they were to fix their residence. The brother of the Regent, Don Antonio Espartero, died at Madrid on the night of the 17th.—Barcelona papers of the 16th inst.

contain a petition addressed by the Catalonian manufacturers to the Regent, expressing their apprehensions from one of Sir R. Peel's speeches in the House of Commons, that a commercial treaty might be concluded permitting manufactured cotton goods to enter Spain, to the ruin, as the petitioners assert, of Catalonia, and the general industry of the kingdom. They state that Sir R. Peel's speech had produced a profound sensation and indescribable alarm in Catalonia. The Barcelona journalists dwell also at much length on the disastrous state of the country, arising from the Carlist guerillas in Catalonia, particularly the one under the command of the celebrated Felip, who had been engaged several times with the troops of the line and National Guards, and had hitherto eluded capture by the authorities. Letters received from the southern parts of the country, from Cadix, Xeres, and Seville, state that those places have suffered severely from the late inclemency of the season, and that in consequence of the severe and drying north winds, and the frost, which had been of almost unprecedented severity in that climate, water and provisions have failed, and the vines and olives, and crops of barley, beans, and other grain, are almost entirely cut off, and the great mass of labourers have consequently been thrown out of employment. Public prayers, for relief from these calamities, have been put up in the churches of these towns; and many of the people, it is said, attribute the infliction to the differences with the Pope!

Portugal.—We have received intelligence from Lisbon to the 18th inst. The negotiations as to the commercial treaty with England had not yet been concluded. The young Prince John had been solemnly baptised at the Royal chapel, M. Capaccini acting for the Pope as godfather, and the Princess Isabel Maria as godmother. The Nuncio had received the Grand Cross of the Order of Christ. The Prince had been created, by royal decree, Duke of Beja. M. Capaccini's demands had not yet been settled. The Bishop of Leiria, who is said to be strongly opposed to Papal pretensions, had been added to the commission for considering them; but it appears that the Court was afraid of a quarrel, and that the French Minister supported M. Capaccini. Baron Lago's plan of conversion was before the Council of State, but nothing has yet been determined respecting it. By the new contract with the tobacco firm, it appears that only 750 contos of foreign bonds were to be purchased and cancelled, instead of 2,000. The French squadron had left Lisbon for the Mediterranean.

Germany.—Accounts received from Vienna, dated the 19th inst., state that M. Pageot's mission relative to the marriage of the Queen of Spain not having been countenanced by the Austrian Cabinet, he had returned to Paris without proceeding to Berlin or St. Petersburgh, as he had originally intended. They also add that M. Pageot was given to understand that the Emperor did not consider that either the French or British Cabinet was justified in imposing a husband on a Queen of an independent state, and that his Imperial Majesty's feeling was in favour of an alliance between the Queen of Spain and the son of Don Carlos, as the best mode of establishing a firm Government in the Peninsula, in which opinion he was joined by the Northern Powers.—Accounts from Munich dated the 18th inst. state that the foreign journals, particularly the French, which have named Prince Luitpold of Bavaria as the future husband of Queen Isabella of Spain, have been seized at the Post-office.—Accounts from Berlin of the 21st inst. state that the situation of his ex-Majesty the Count of Nassau, whose illness was mentioned in our last, is still precarious, though some favourable symptoms in his complaint have manifested themselves. The latest bulletin, signed by Dr. Dieffenbach, states that "the Count of Nassau has slept at intervals during the night, and especially towards morning; the cough has abated; his Majesty is free from fever this morning. All other symptoms are likewise favourable." The illness, however, is still such as to inspire apprehension. H.R.H. Prince Frederick arrived at Berlin on the 21st inst. The Prince of Orange has so far recovered from his recent accident as to be able to walk out. His Royal Highness still limps a little, but is able to walk with a little assistance. The journals inform us that the Archbishop of Dunin, in the duchy of Posen, has just addressed an encyclical letter to the clergy of his two dioceses, remarkable for the spirit of moderation which pervades it. The Archbishop recommends his clergy to show the same charity towards Protestants as Catholics, and declares that they have no right to excommunicate any one. With respect to mixed marriages, the Archbishop enjoins his clergy to admit persons so united to confession and all the other sacraments. He exhorts them besides to employ, in the exercises of their religious functions, persuasive means only. Private letters from Berlin, dated the 16th inst., state that a proposition now before the Prussian Council of State, on the subject of excluding the Jews of that country from the liability to serve in the army, has led to a conference on the subject between M. de Humboldt and M. de Stollberg. In a letter which has been published, M. de Humboldt says, "Ill-natured rumours have been current on this subject; but if public opinion be against the principles involved in the proposition, I do not hesitate to regard it as contrary to sound policy and liberal feelings. It does not belong to man to interpret the decrees of God. The ages of barbarism show to what an extent the human mind may err!" M. de Humboldt adds that complete emancipation appears to him to be a necessity of the times. The Academy of Sciences has just given an example of tolerance, by admitting as a member, on the proposition of M. de Humboldt, the learned philosopher Dr. Riess, of the Jewish persuasion. The papers announce the removal of M. de Rochow from the important post which he has so long occupied in the Cabinet of Berlin to that of Prussian Minister at Frankfort. This change appears to have been hailed with great satisfaction throughout Germany, and to be regarded as a proof that the King of Prussia still adheres to the same policy which has already enabled him to conciliate his Polish subjects, to pacify the church, and to raise the character of the public press. The Criminal Court, presided over by M. Von Kleist, passed sentence, on the 1st April, in the proceedings against the author of the "Four Questions." It sentences the author to hard labour in a fortress for two years and a half, for the twofold crime of insolent and disrespectful conduct, and of high treason.—In consequence of the refusal of the English Government to recognise the validity of the convention between the New Zealand Company and a German Colonisation Company for the purchase of Chatham Islands, the provisional committee of the German society has declared all the obligations entered into with it to be null and void.—The Superior Court of Bremen has given judgment against a British Captain Thomas Edward Symons, for having illegally detained a ship called the Jules Edward, of Bremen, on suspicion that she was fitted out for the slave-trade.

Hanover.—Private letters, dated the 18th inst., inform us that the King has returned from his visit to Berlin. The same accounts state that a petition to be signed by the merchants is now in circulation, addressed to the Assembly of the States, against the accession of Hanover to the German Customs Union.

Belgium.—Accounts from Brussels of the 23d inst. inform us that the subject which has been engaging the attention of the Chambers during the past week has been that of the construction of a canal from Zelzaete (situated close to the Dutch frontier, near to Sas de Gand) to the sea. In the Senate one of the members asked the Minister of Foreign Affairs whether twenty-five English sailors had not been engaged to man the British Queen steamer, and whether that vessel ought not to be navigated by Belgians? The Minister replied, "If we have selected some English sailors, it is for the better navigation of the steamer and the greater security of passengers; but when our sailors have gained experience, the English ones will be paid off."

Norway.—It is stated in a letter from Christiana that the Storthing have ordered the modification of Article 112 of the Fundamental Code, which excludes Jews from the right of establishing themselves in the country.

Italy.—Private letters from Rome inform us that an artist of that city, named Roudoin, has just applied to lithography the photographic process of M. Daguerre. He has succeeded not only in fixing on the stone the photographic impress, but also in obtaining proofs from it in the usual way. The first experiments were made on an a star, the Nebula of Orion, the image of which was received in a telescope and transferred to the stone. Some proofs have been sent to M. Arago, who considers them satisfactory.—The Genoa papers announce the arrival of Mr. Brunel in that city, and state that he had been invited thither by a royal company formed for constructing a railroad between Genoa and Piedmont. He immediately inspected the plans and surveys made by Major Porro, and then proceeded to his own survey.—Accounts from Florence state that a mine of quicksilver, discovered last year in the environs of Peravezza, near Pisa, is in full work, and during the last month yielded more than 6,000lbs.; a produce that is daily increasing. The Grand Duke has visited it, and expressed his satisfaction at the able manner in which it had been conducted, announcing the intended appointment of a commission of French, English, Italian, and German geologists and chemists, to search for the other mines of quicksilver which, according to tradition, exist in the Grand Duchy.

Russia.—The Emperor has ordered, at the recommendation of the Minister of Finance, that the glacis of the citadel of St. Petersburg shall be converted into a park. On the 9th inst. at 8 in the morning, and 10 at night, the mercury in Réaumur's thermometer was 5 degress below zero; on the 10th inst. it was not quite so cold, but it still continued 2 degrees below zero. Private letters from St. Petersburg state that the Imperial Family have given up their plan of visiting Germany in the summer, and that the chief reason for this determination is that the accouchement of Princess Mary, consort of the Hereditary Grand Duke, is expected towards the autumn. The Empress also is said to be in such good health that a journey to Ems does not seem necessary. It is, however, thought that the Emperor will go to the Rhine towards the end of the summer to meet his Royal relations at Coblentz, and accompany the King of Prussia to the camp at Cologne. The same letters say that the Duke of Leuchtenberg will go to Munich in September, and remain there some time.—An imperial ukase, dated Feb. 28, addressed to the Minister of Imperial Domains, decrees among other things that the peasants of the Crown and the nobility, who have distinguished themselves by the cultivation of potatoes, shall be rewarded by gold and silver medals, and also by premiums in money.

Greece.—Private letters from Athens of the 10th inst. state that all apprehensions of war with Turkey had subsided, and that the people were willing to leave the settlement of their differences with the Porte to the European Powers.

Turkey.—By the arrival of the Levant mail, we have received intelligence from Constantinople to the 7th inst. A change of Ministry seemed imminent, occasioned, it is stated, by a serious dispute between Sarim Effendi, the Secretary for Foreign Affairs, and Izzet Mehemet, the Grand Vizier. The difference is said to have arisen out of a note addressed to the Porte by Sir S. Canning; and Sarim having been supported by Riza Pacha, the Grand Vizier had been compelled to apologise, and give way; and this was regarded as the forerunner of his speedy fall. Various rumours were current respecting the successors to compose the new cabinet. Halil Pacha, the Sultan's brother-in-law, was mentioned as Seraskier, or Commander-in-Chief of the Ottoman army, in place of Tahir Pacha; and Chosrew Pacha was again spoken of as likely to be Grand Vizier, in place of Izzet. Private accounts add that the note which had given rise to such confusion in the Ottoman Councils was supposed to have reference to a demand for the passage of English troops for India through the Isthmus of Suez, and confirm the report, noticed in a previous Number, that Sami Pacha (Mehemet Ali's Envoy) is at Constantinople on this business. No progress has yet been made in the object of M. Mavrocordato's mission; but it is understood that the preliminaries are nearly determined, and that the Porte will appoint a special plenipotentiary for the purpose of negotiating directly with the Hellenic minister. In the mean time the Greek Government has withdrawn its troops from the frontier, and the warlike preparations adopted by it are at an end. This result is said to have been effected by a strong remonstrance on the part of the ministers of the Five Great Powers at Athens, embodied in a collective note to M. Rizo: to which that minister returned a satisfactory answer. Major Farrand, the bearer of the ratification of the commercial treaty to the Court of Teheran, left Constantinople in the Trebizond steamer on the 3d inst. Intelligence had been received from Beyrout and Damascus of the 25th and 19th ult. respectively. The state of the Lebanon continues tranquil, but affairs are represented as becoming every day more gloomy, and it is said that the Druses have obtained such complete ascendancy as to have become objects of apprehension to the Turks themselves. With the exception of a skirmish between a body of Maronites, and a small detachment of Albanians and Druses sent to destroy two powder manufactories at the Maronite villages of Bekfaya and Shaouir, in the Meteen district, no collision has taken place between the sects; but apprehensions appear to be entertained that civil war will again break out. In the mean time commerce is in a state of stagnation, and the necessaries of life have become very dear. Nezib Pacha has quitted Damascus, accompanied by the Druse chief Shilly Arian, and a body of 5,000 men. He has directed his march upon the Druse district, for the ostensible purpose of compelling the peasants to pay the taxes; but really, it is thought, with the intention of reinforcing the garrisons under the orders of Omar Pacha, and to be ready, on the melting of the snows, to resist any attempts that may be made, either by the Christians or the Druses, to attack the Turkish troops, and to overthrow the government recently established.—No accounts had been received as late as the 19th inst. at Damascus of the return of the Hadj. It was reported there that Achmet Pacha had beheaded some Arab chiefs in the Desert, and it was apprehended that the tribes of these chiefs had united, and attacked the caravan. The number of pilgrims accompanying the last Hadj were more numerous than upon preceding years; and it is computed that nearly a twelfth of the population of Damascus were among the number. It was also known that the loss by disease among the pilgrims had been great, the caravan having been attacked by a species of cholera. According to accounts from Jerusalem, the outward behaviour of the Christians to the English bishop is peaceable and friendly. Tayhar Pacha has rendered him every possible assistance and protection that it was in his power.—Accounts from Gedda mentioned that Beni Om, the Scheriff of Mecca, having, through avarice or ignorance, levied very heavy duties on British goods at Mocha, Osman, Pacha of Gedda, had forwarded a complaint against him to Constantinople. The Porte had condemned the conduct of that functionary, and ordered Osman Pacha to supersede him in his post. Osman hastened to obey his orders, but no Mussulman daring to lay his hands on the sacred person of a scheriff, he employed to that effect a detachment of Albanian soldiers. Beni Om was then proceding under an escort to Constantinople.

Egypt.—Our news from Alexandria comes down to the 6th inst. Mehemet Ali was at Minet-el-Gamk, in Lower Egypt, where he was actively engaged in agricultural pursuits. He had constructed 600 sakies, or machines for irrigation, and the entire population was engaged in making embankments. For the purpose of improving the cotton grown in Egypt, he had imported three cargoes of cotton-seed from Senaar, and a further supply from Georgia, in the United States, which was to be sown this season. He had issued a proclamation to the merchants of Alexandria, informing them that no complaints or protestations that could arise or take place with regard to disbursements made for purchases of produce would be taken into consideration, neither would there be any notice taken of them if the produce that they desired to purchase had not beforehand been weighed and measured. Orders had been received at Alexandria to equip the four frigates for a cruize. The declared object of their equipment was to transport oxen from Tarsus for the use of the Pacha's pachalic; but it was supposed, that under pretence of conveying oxen, the Viceroy wished to make a demonstration whilst the Turkish Admiral Tahir Pacha was at sea with a small division. The plague continued with great severity at Damietta, where the Swedish Consul, and several of his family, had died of it. Mutuch Pacha, the Admiral of the Egyptian squadron, has just died. It was thought that Said Pacha, Mehemet Ali's son, would be his successor; while other reports state that he will be succeeded by Hassan Bey.

West Indies and South America.—Advices have been received from Barbadoes to the 2d March. Sir Charles Grey was sworn in Governor-in-Chief of Barbadoes and its dependencies on the 22d Feb. The Barbadoes journals complain of the irregular manner in which the new West Indian mail-packet system is conducted: and similar complaints are made in the Demerara, Tobago, and St. Lucia papers.—We have also received recent advices from Buenos Ayres. The papers thus brought contain the message of the President to the House of Representatives on its assembling, which event occurred on the 1st Jan. A large portion of this document is occupied with severe animadversions on Revera, Chief of the Oriental state, and a strong determination is expressed to put him down. It contains various expressions of gratitude for the proffered mediation of England, between the republic and France, to put an end to the misunderstanding which has been lately terminated by raising the blockade, and after professing much anxiety for the suppression of the slave-trade, declares "that it perseveres, as in duty bound, in sustaining the right of the republic to the territory of the Falkland Islands, and confidently trusts that the British Government will perform an act becoming its high intelligence and rectitude." The budget estimates the expenditure of 1842 at a sum equal to about 705,000*l.* sterling, including the floating debt; and the ways and means to meet it at 535,000*l.*; leaving a deficiency on the year of 170,000*l.*: nevertheless, it is stated—"The solemn pledge, as it regards the loan from England, occupies the attention of Government. It is anxious that the opportunity should arrive for a satisfactory arrangement, which, retarded by notorious and insurmountable circumstances, may bear in itself the guarantee for its punctual fulfilment."—At Rio Janeiro, the custom-house, merchants' warehouses, and retailers' shops are represented to be full of goods, and the importation of them in 1839 is given at 33,862 packages, 58,241 in 1840, and 47,843 in the last year. Lima papers to the 19th Dec. have been received, but they contain little matter of political interest. Preparations were making there to raise another army to oppose the Bolivians, and Don Manuel Menendez, President of the Council of State, who appeared to be temporarily charged with the supreme direction of affairs, had issued a proclamation of amnesty to all political offenders or parties, to the intent that all should rally round the standard of the country, and take vengeance on the Bolivians for the defeat of Incague. A postscript of a letter from Arequipa is given in these papers, of the 6th Dec., stating that news had been received there from Paro, that the Bolivian army had recrossed the Desaguadero on their return to Bolivia, where a revolution was said to have broken out against Balevian, and in favour of Santa Cruz. The report was that the latter was arrested, and deprived of the command of the army. San Roman, the Peruvian General, was said to be raising troops in Cazco, and had at the date 1,500 men to oppose the Bolivians. Arequipa had declared for Vivanco as Chief of Peru.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of a number of petitions,

The Duke of WELLINGTON, in moving the third reading of the Spirit Duties Ireland Bill, made a few remarks expressive of a belief that there was no ground for apprehending that the measure would lead to an increase in illicit distillation in Ireland.—Lord MONTEAGLE said, that if the force in Ireland was sufficient to prevent illicit distillation, no better tax could be proposed; but when it was known that one-third of the police force in Ireland at this moment was occupied in endeavouring to prevent illicit distillation, and that without succeeding in the endeavour, he scarcely expected greater success when the inducement to fraud would be greater.—The Earl of WICKLOW, though quite alive to the danger pointed out by the noble Lord, was ready to give his confidence to the statement of the noble Duke.—After a few remarks from the Marquis of CLANRICARDE and Lord CLONCURRY, the bill was read a third time and passed.

The Queen's Prison Bill then passed through committee.

Tuesday.—The House sat only a short time, which was entirely occupied with the presentation of petitions.

The Earl of WINCHELSEA gave notice that on Friday he would present a petition signed by 5,000 farmers and growers of fruit in Kent, complaining of the injury they had sustained in consequence of the low duty on the importation of foreign fruit.

Thursday.—Lord MAHON, accompanied by several members of the House of Commons, brought up the Copyright Amendment Bill, which was read a first time.

Lord CAMPBELL presented seven petitions from different places in Scotland, praying that all restrictions upon the importation of corn and provisions might be done away with. He also presented petitions from places in the counties of Down and Londonderry, praying for an alteration in the law respecting marriages by Presbyterian clergymen.

Lord DENMAN said that some differences of opinion had arisen between some noble and learned Lords on the subject of the Law of Evidence Improvement Bill. As these differences of opinion would be more satisfactorily arranged by a discussion among those who took an interest in the bill than by a debate in that house, he should move that the order of the day for the report on that bill be discharged, and on Monday he would move that the bill be referred to a select committee. The order of the day was then read and ordered to be discharged.

Friday.—The Royal Assent was given to the Irish Spirit Duties Bill, the Corn Importation Bill, and others of more local interest. A desultory and somewhat irregular discussion took place on the appointment of the magistracy, arising out of the presentation of a petition by the Marquis of Normanby, but it led to no result. The Earl of WINCHELSEA presented a petition from the fruit-growers of East Kent against the importation of foreign fruit.

HOUSE OF COMMONS.

Monday.—Mr. HUME took the oaths and his seat, as member for the Montrose Burghs.

Mr. REDINGTON, the Chairman of the Southampton Election Committee, reported the committal of John Wren, for refusing to answer a question; and moved that he be called to the bar and interrogated. After a conversation, he was brought to the bar, and expressed his willingness to answer the question, if the House should decide that he ought to do so. It seems, however, that the House holds itself incompetent to inquire, pending an election committee, into any of the evidence which that committee may have taken, and therefore has no means of informing itself whether a particular question be or be not one which a witness ought to answer. Sir R. Peel recommended that the witness should be remitted to the committee, with a general admonition that the committee must be the judges whether the question had or had not a tendency to criminate him. This was substantially the course which, after a long discussion, the House adopted, discharging the witness, however, from present custody.

Mr. PAKINGTON, as Chairman of the Ipswich Election Committee, reported the following resolutions to the House:—"That Rigby Wason, Esq., and George Rennie, Esq., were not duly elected to represent the borough of Ipswich in the present Parliament: that the last election for the borough of Ipswich was a void election. The committee also resolved unanimously, that Rigby Wason, Esq., and George Rennie, Esq., had been, by their agents, guilty of bribery at the last election for the borough of Ipswich. That the committee are unanimously of opinion, from the evidence given before them, that extensive bribery prevailed at the last election for the borough of Ipswich; and that the issuing of a new writ for the said borough ought to be suspended until the said evidence shall have been taken into the consideration of the House. Resolved unanimously, that the chairman be requested to move that the report, together with the evidence taken before the committee, be printed, and that the Speaker do not issue his writ for the return of two members for the borough of Ipswich until the report and evidence be printed and submitted to the House." The hon. Member then moved, that the report and the evidence be printed, and that no new writ be issued for the borough of Ipswich before that day three weeks.—Agreed to.

The Cottenham Drainage Bill was read a third time and passed.

The Thames Haven and Dock Railway Bill, the Warkworth Harbour Bill, the Liverpool Health of the Town Bill, and Beneke's Naturalisation Bill were read a second time and ordered to be committed.

On the motion for going into committee on the Income-tax, Mr. Wallace renewed his objections to the measure, and desired, in this stage of it, to know whether any and what alterations were intended in the tariff. He wished Sir R. Peel would take a year to consider whether, if the country *must* have an Income tax, the better course might not be to make it a tax of 12 per cent. instead of 3, and abolish other more injurious modes of taxation. Meanwhile, he recommended a temporary issue of Exchequer-bills. He was not, however, inclined to interpose objections for mere vexation or delay.

Sir R. PEEL asked what would have been said to Government, if, after taking five months' time to look at the finances and resources of the country, they had ended with proposing another year of temporary expedients? The money-market certainly was now in a healthy state, but that state was the result of the vigorous effort in progress for the restoration of public credit; and if that effort were to be relaxed, the money-market would fall again into disorder. As to the tariff, he adhered to all the leading principles which he had announced respecting it. And he would not object, after the report on the Income-tax Bill, with which he proposed proceeding from day to day, to discuss the general outline of that tariff. He hoped it would not be thought necessary now to take another debate on the principle of the Income-tax Bill.

Mr. HUME expressed his thanks to Sir R. Peel for the mode in which he had grappled with commercial restriction. He wished Government had done more; but still it was doing much. He particularly regretted that a greater impression was not made upon the corn monopoly; the effect of which, he considered, was to give the landed interests from the public purse as much as they would have to pay for the Income-tax. He thought HER MAJESTY would gladly give up a portion of the useless state surrounding her, and he would fain strip some of the gold lace from her superfluous attendants. If a tax like the present was required, it should have been on property alone, and not on income. In its present shape it would fall heavily on the industrious classes, by diminishing the funds for the maintenance of labour.—The House then went into committee on the Bill. Some conversation arose on the proposition that the Income-tax should commence from the 5th April, 1842, and some questions were put as to the time when the tariff should come into operation.

The CHANCELLOR of the EXCHEQUER reminded the house that the tariff was to be permanent, and the Income-tax temporary; and Sir R. PEEL said that as the tax was to last for three years, it was immaterial whether it commenced in April or July, but that it would be convenient that it should have effect from the commencement of the financial year, on the 5th April. This was accordingly carried; and schedule A passed without a division. On schedule B, imposing 3½*d.* per pound in England, and 2½*d.* in Scotland, on the profits of farmers, taken at half the annual value, Lord HOWICK objected that this test was a very inaccurate one. On large farms well cultivated, there was a much larger surplus, in the shape of rent, than on smaller and worse tilled farms; and thus the tax imposed by this Bill would fall the heaviest on the best farming. He would advise the omission of this separate schedule for the farmers; whom he would propose to tax, as the hop-farmers and nursery-gardeners were intended to be taxed, in the same schedule with the traders.—Mr. GOULBURN vindicated this test on the score of general convenience. The accounts of farmers were so mixed up with the consumption on their farms, that there was hardly a possibility of estimating profits in all individual cases.—Lord WORSLEY said, he believed the farmers would rather pay upon the half rental than submit to the inquisitorial examination of each individual case. Several Scotch Members intimated the preference of the northern farmers for the individual mode of examination. After a little more conversation, schedule B was voted without a division.

On schedule C, Mr. F. T. BARING asked if foreigners holding British stock were to be subjected to the tax? Sir R. PEEL answered in the affirmative, and Mr. HUME complained that a breach of public faith was committed by subjecting the funds to taxation.—Mr. RICARDO proposed an amendment, the object of which was to make a distinction, in levying the tax, in favour of terminable annuities.—Mr. GOULBURN denied the distinction in principle between annuities for a longer and for a shorter term. It was, he said, only the temporary nature of this tax that made it seem unjust. If the tax were permanent, then the holder of an annuity terminable in ten years, would in ten years cease to pay the tax, while the holders of more lasting income would still continue their contributions. The price of the present terminable annuities, since the present measure was announced, had actually risen in the same proportion with the other public funds. It would have been impossible to fit the measure to the different durations of all the different kinds of income.—Mr. V. SMITH thought that the Chancellor of the Exchequer had been giving insufficient reasons all through the committee. Lord HOWICK thought there were special circumstances in this case taking it out of the general principle.—The committee divided on Mr. RICARDO's amendment, which was negatived by a majority of 253 against 117.—Some discussion then arose respecting the further progress of the Bill, and Sir R. PEEL said, that before he moved the third reading he would bring on the tariff.—The House then resumed, and the other orders of the day were diposed of.

Tuesday.—The South Metropolitan Gas Bill was read a second time and ordered to be committed.

The Bolton and Westhampton Road Bill, the Bolton and Preston Railway Bill, and the Saundersfoot Harbour Bill, were read a third time and passed.

The third reading of the Southwark Improvement Bill (No. 2) was postponed until Friday, after a long discussion on a clause proposed by Mr. R. PALMER, for the more adequate compensation of church lessees, which ended in the withdrawal of the clause.

Mr. REDINGTON, as chairman of the Southampton election committee, reported that John Fleming, Esq., a Member of that House, had refused to answer a question put to him when under examination as a witness, upon the ground that he could not answer it without violating private confidence.—Mr. FLEMING, who was in his place, gave a short explanation, in which he stated that his refusal arose from no feeling of disrespect to the committee, but that the question called upon him to disclose the names of gentlemen from whom he had confidentially received subscriptions for the legitimate purposes of the Southampton election; that he could not make that disclosure without a breach of personal confidence and honour a breach which he did not believe the House could desire of him; and that he apprehended the question to have been put for no substantial purpose, but merely for the gratification of an impertinent curiosity in the petitioners. After this explanation he retired, that his case might be discussed by the House without the restraint of his presence.—Mr. REDINGTON begged to have it understood that he and the committee had had no choice, except to act judicially. So acting, he must move that Mr. Fleming should attend and be admonished by the Speaker that the committee was the tribunal for determining upon a witness's obligation to answer.—Mr. Fleming then withdrew from the House; and a discussion arose on the motion that he be ordered to attend in his place, and be informed by the Speaker that he must attend the committee and answer the question. The motion was carried; and on Mr. Fleming's return to his place, the Speaker read the resolution, to which the hon. Member bowed, and sat down without observation.

Some other business of no general interest succeeded; after which,

Mr. O'CONNELL called the attention of the House to the want of Roman Catholic chaplains to the soldiers of that faith serving in India and China. At home and in the colonies he said there were usually Roman Catholic clergymen within reach of the troops; but there was no such resource in the East. He asked for a committee to consider this subject.—Mr. B. BARING assured Mr. O'Connell that there was no indifference on the part of the Indian Government to the spiritual welfare of the Roman Catholic soldiers, and that further consideration should be bestowed upon the subject by the Board of Control.—After some observations from Mr. HUME in support of Mr. O'Connell's recommendation, Sir H. HARDINGE gave some explanations as to the religious discipline of the army, and expressed the fullest sympathy with his Roman Catholic comrades. He stated, however, some general objections to the establishment of regimental chaplains, whether Catholic or Protestant, and hoped the motion would not be pressed.—After a few remarks from Sir R. H. INGLIS, the motion was withdrawn.

Mr. ELPHINSTONE then moved a resolution, "That the House would at an early period resolve itself into committee, with a view of imposing on the succession to real estate a scale of legacy and probate duties of the same amount as on succession to personal property." He gave a statement of the revenue produced by probate and legacy duties on personal property, and added his own calculation of the revenue to be expected from reality. He thought that justice and common sense required the equalisation of the two imposts.

The CHANCELLOR of the EXCHEQUER opposed the motion, on the ground that the proposed tax upon landed property would fall almost exclusively on the smaller estates, the larger properties being generally in settlement; so that the tax would be much less productive than was imagined. He concluded by saying that there were already heavy charges in the transfer of real property from which personal property was exempt.—Mr. HUME thought that the Chancellor of the Exchequer had made out a good case in favour of the motion. He considered that the Government, administering impartially the affairs of the country, was bound to go into this inquiry, before it got the obnoxious Income-tax passed, so that it might be seen to what extent the land bore its share of the burdens of the State.—Messrs. EWART and WALLACE briefly supported the motion.

Lord J. RUSSELL did not see why a tax on succession should not be so imposed as to apply to settled property. But when a bill for an Income-tax was already in progress, of which the House had by several divisions affirmed the principle, he was not prepared, by voting for this motion, to impose a still further taxation on the country.

Sir R. PEEL opposed the motion as an attempt to renew the discussion of the Income-tax, and to obstruct the progress of that measure, the principle of which the House had already affirmed. He considered the tax on income, objectionable as it was, was preferable to the present proposition, which involved a very complicated and extensive inquiry. He would pronounce no positive opinion on the subject, as it might hereafter be matter for consideration; but the adoption of the motion at present would overthrow the decision of the House on the financial measures of the Government, and he must, therefore, oppose it.

Mr. ELLICE supported the motion, with the hope, he said, of obtaining a complete review of the whole system of our taxation on real as compared with personal property.—Dr. BOWRING moved the addition of some words, proposing to take a legacy and probate duty on land by way of substitution for some part of the Income-tax.—Lord HOWICK said he could not vote for a measure which, unless accompanied by a general revision of stamp-duties on deeds, would only create additional inequalities and anomalies. Indeed, he was by no means disposed, under any circumstances, to vote for a tax not proposed by the Government for the time being; and he had an especial dislike to a legacy duty, which he considered as a very cruel kind of impost.—Dr. BOWRING withdrew his amendment; and then the House divided on the original motion, when there appeared—For the motion, 77; against the motion, 221: Majority against the motion, 144.

Col. FOX moved for some papers respecting Port Natal and the Boors and Aborigines of the Cape of Good Hope.—Lord STANLEY explained the circumstances under which the Boors had emigrated from the British territory at the Cape to Port Natal, and urged the impossibility of either recognising their present claims to be treated as an independent people, or allowing them to place themselves under the protection of any European Power. The British Government could not sanction any attempt on the part of these people to throw off their allegiance to her Majesty.—Some conversation followed, in which Lord J. RUSSELL and Mr. HUME took part, and the papers were ordered; as also were some moved for by Mr. BURROUGHS respecting the alleged misconduct of the Norfolk rural police.

On the motion of Viscount MAHON, the Copyright Bill was read a third time and passed.—The Pentonville Prison Bill and the Parish Constables Bill were severally brought in and read a first time.—On the motion of Mr. MASTERMAN, the Ecclesiastical Leases Bill was read a first time.—The Exchequer Bills Bill was brought in and read a first time.

Wednesday.—There being only 22 Members present at 4 o'clock, the Speaker adjourned the House till Thursday.

Thursday.—The reports of the Lichfield and Blackburn Election Committees were severally brought up by Mr. DIVETT and Sir E. HAYES, declaring that Lord A. Paget for the former, and Mr. J. Hornby for the latter, were duly elected.

On the motion of Sir J. C. HOBHOUSE, the Lords' Amendments on the Nottingham Gas Bill were agreed to, and the Bill passed.

The following Bills were read a third time and passed:—The Buckland Inclosure Bill, the London and Blackwall Railway Bill, the Glasgow and Redburn Bridge-road Bill, and the Sheffield Ashton-under-Lyne Railway Bill, the Huish Champflower Inclosure Bill, and the Great Torrington Market Bill.

The Wicklow Harbour Bill and the North American Colonial Association Bill were read a second time, and ordered to be committed.

Mr. REDINGTON reported from the Southampton Election Committee, that Wm. Rouse Mabson having disobeyed the Speaker's warrant, by refusing to attend and give evidence, and produce documents, had been ordered into the custody of the Sergeant-at-Arms. He then moved that Wm. Rouse Mabson be committed to Newgate.—Mr. BUCK and Mr. GODSON, Members of the Committee, opposed the motion.—Mr. REDINGTON then substituted the motion that Mr. Mabson be called to the bar and examined.

The SOLICITOR GENERAL, on examining the Speaker's warrant, doubted whether it were regular, inasmuch as it was dated in Sept. 1841. After some discussion on this point, the witness was called to the bar and examined, and being interrogated by the Speaker and various Members, stated that he had incautiously sent the documents required to the chairman of the election committee, Capt. Ward, who did not acknowledge the receipt of them, and knew nothing about them.—A debate then arose as to what should be done with the witness, which ended in a division on the question whether he should be retained in the custody of the Sergeant-at-Arms, or that the debate be adjourned. Sir R. Peel and Lord Stanley both agreed that the answers of the witness were extremely unsatisfactory, and the adjournment was negatived by 176 to 16. After the division another motion was made, that the witness be forthwith discharged, on which another debate arose, one of the points in the discussion being the validity of the Speaker's warrant under which the witness had been summoned, that validity being supposed to be affected by the postponement of the consideration of all election petitions from the last short session of Parliament to the present one. On a division there were 117 to 32 for retaining the witness in custody. The witness was accordingly ordered to remain in the custody of the Sergeant-at-Arms. This case occupied the House upwards of four hours.

The Exchequer-bills Bill was, after some observations from Mr. Hume, the Chancellor of the Exchequer, and Mr. Williams, read a second time, and ordered to be committed on Friday.

Mr. Wallace moved for leave to bring in a Bill to reduce the present number of Judges in the Supreme Courts of Scotland from 13 to 9, by abolishing one of the two co-ordinate Courts of Review into which that Court is divided.

Sir J. Graham relied upon the almost unanimous concurrence of the House, in enabling him to resist the motion. He said that the opinions of the majority of the Committee of 1840, and of the highest Scottish legal authorities, were adverse to the changes proposed by Mr. Wallace; and agreeing himself in these opinions, he considered the motion highly inexpedient.

Mr. Rutherford declared that the people of Scotland were perfectly satisfied with the manner in which criminal justice was administered amongst them, and censured the conduct of Mr. Wallace in bringing forward these motions from time to time.—Mr. Wallace replied; and on a division the motion was rejected by 187 to 22.

Mr. Wallace then moved for what he termed "a return of the plunder of the Post-office," namely, that the return, showing the applications which have been made to the Post-office for letters which were missing, and which contained money or money's worth, which return was presented to this House on the 4th of March, be printed.

Sir G. Clerk did not think that any useful purpose would be served by agreeing to the motion, seeing that the committee on printed papers had already decided that it was unnecessary.—After some conversation, shared in by Mr. V. Smith, Mr. Hume, and Mr. F. T. Baring, the latter of whom considered that much of the money lost in passing through the Post-office was owing to the remissness of the public, in not availing themselves of the security of the Money-order department,

The Chancellor of the Exchequer acceded to the suggestion of an abstract of the return being prepared, which was accepted by Mr. Wallace, who thereupon withdrew his motion.

Viscount Ingestre moved that an address be presented to her Majesty, praying that she will be pleased to order a maritime survey of the coasts and harbours of the islands of New Zealand, when vessels can be spared for that duty without inconvenience to the public service. The trade, he said, was already considerable, and many wrecks had taken place owing to the want of this survey. There was no department of the Admiralty which was of more value to the public than the Hydrographer's-office.—Capt. Pechell approved of the motion, and was surprised that there had been no survey up to this time. He agreed in the utility of the Hydrographic-office, and thought that the officers should be better paid, and more accommodation provided. The motion was then agreed to.

Sir J. Graham obtained leave to bring in a Bill for remedying defects arising from the misprision of officers in recording fines and recoveries in Wales and Cheshire, and for better recording the same.

The report of the Colonial Passengers Bill was brought up, and several verbal amendments inserted on the motion of Lord Stanley. The further consideration of the report was then postponed until Monday.—The report of the Dublin Police Bill was brought up.—Sir J. Graham said that notwithstanding the pressure of most important measures, he did not altogether abandon the hope of introducing a Bill to regulate the medical profession. Before doing so, however, it would be necessary to pass a Bill respecting the charter of the College of Physicians.—The Turnpike-Roads (Ireland) Bill passed through committee, and was reported.—The Timber Ships Bill was read a third time and passed, as was the Soap Duties Drawback Bill.—The Customs Duties (West India and North American Colonies) went through committee, and the Law of Merchants Act Amendment Bill was read a second time.

Friday.—The House having resolved itself into committee on the Income-tax Bill, Mr. Roebuck moved an amendment reducing the tax upon the profits of professions, trades, or avocations, to 3½*d.* in the pound, which was negatived by a majority of 146.—The original motion having been put, Mr. Crawford moved the rejection of the whole schedule, which the House negatived by a majority of 209.—Another division took place, on an amendment moved by Sir C. Napier, for the exemption of generals and flag officers whose incomes were derived from services; when the House rejected the motion by a majority of 173, thus affirming the original proposition, that parties holding public offices shall pay 7*d.* in the pound on their incomes.—The House having resumed, Richard Gibbons was brought up in custody, severely reprimanded by the Speaker, and discharged.

CITY.

Money Market, Friday.—The English funds are still advancing. Consols for money improved to 92⅝ to ¾, and for the account to 92⅞; Three per Cents. Reduced left off 92; Three-and-a-half per Cents. Reduced, 100¼; India Bonds, 20s. to 22s. premium; Exchequer-bills, 38s. to 40s. premium; Bank Stock, 167 to 168; and India Stock, 246 to 248.

Metropolis and its Vicinity.

Thunder-Storm.—On Sunday afternoon, the Metropolis was visited by a severe thunder-storm. It was seriously felt in the southern and eastern districts. At Brixton, the steeple of the church was struck by the lightning about 15 feet from the top; the granite cross by which it was surmounted was shivered to pieces, the steeple thrown down on the top of the belfry, and a boy who was ringing the bells for afternoon service had both his arms broken by the fall of a stone. Two houses at Tulse-hill were set on fire by the lightning. The flames burnt with violence some time, and were not got under before considerable damage had been done. The effects of the storm, which lasted from two to four in the afternoon, appear also to have been severely felt in the eastern suburbs, and considerable damage was done in the low parts of Wapping, Shadwell, and Limehouse, by the overflowing of the rain into the various vaults and stores with which the neighbourhood abounds. The lightning struck the steeple of All Saints church, Poplar, displacing a large stone, which fell on the roof of the church, and it is thought that a survey of the spire will in consequence be necessary. A house in King David-lane had its roof nearly destroyed by the lightning; and the tall chimney of the manufactory of Messrs. Fairburn and Seawards, engineers, at Mill-wall, was struck, and its shaft much damaged. A house in New Gravel-lane also received a severe shock, part of the roof being taken off; and Limehouse church is said to have been struck, but no serious injury resulted. In the outskirts of Bow, Stratford, Edmonton, and even at Hampstead, Highgate, and Holloway, the storm is said to have done great damage to the trees, many of which were torn up by the roots.

Metropolitan Improvements.—Considerable progress has been made in the formation of the line of street which is to continue from Farringdon-street to the church of St. James, Clerkenwell. A substantial thoroughfare has been made from Farringdon-street to West-street, Smithfield, which is expected to be finished in a few days, and opened to the public. The roadway will be 65 ft. wide, and the footpaths on each side, which are composed of Yorkshire stone, 11 ft. wide, thus leaving a clear carriage-way of 43 ft. The river Fleet, commonly called "Fleet-ditch," has been diverted from its original course, and turned into the centre of the street, while gas and water-pipes have been laid down, and cellars or vaults built on each side of the street, so that the houses intended to be raised may at once be erected, as soon as the contracts shall be taken for that purpose. The commissioners for the City improvements are said to be in treaty with the authorities of the out ward of St. Bartholomew, to take the houses for the purpose of opening the line to Cow-cross, when the street will be thus far continued; so that there will be a direct line, without passing through Smithfield, to the north-west division of the Metropolis.—At a Court of Common Council, held on Thursday, Mr. R. L. Jones brought up the report of the Royal Exchange and Gresham Trusts Committee, on having agreed with the Bank of England for the advance of 70,000*l.* for the City's moiety of expense of rebuilding the Royal Exchange and the New Gresham College, and for sealing a bond for 5,000*l.*, part thereof. The report entered into the details of the agreement with the Bank of England for the proposed loan; and the mode suggested by the committee for again paying it off, which was, that nine-tenths of the net income which shall arise from the rents of the Finsbury estates, beyond the present rental of 115,000*l.*, should be set aside, together with any further surpluses of the Gresham fund which may arise. By this plan the committee thought that a sinking fund would be formed fully adequate to discharge the debt in about nine years from the present time. A conversation of some length took place upon the subject of the mode proposed for redeeming the loan; and Mr. Jones having offered no objection to the postponement of the consideration of that part of the report, the court agreed to the former portion, relative to the negotiation with the Bank. It was mentioned incidentally in the discussion, by Mr. R. Taylor, that it would be well if the City lands committee would take care, in letting the estates, to prevent them from being made burial-places; and Mr. Hall, the chairman of the committee, stated that the committee were doing all they could to prevent the extension of the practice. A petition was afterwards presented from Mr. John Belcher, proposing a viaduct as a means of remedying the evil arising from the acclivity at Holborn-hill, which was referred to a committee. A long discussion took place on the report of the committee recommending the removal of the attic over the ball-room at the Mansion-house. The report was ultimately agreed to, and referred back to the committee to be carried into execution.

East India House.—On Wednesday the Directors of the East India Company gave an entertainment to the Marquis of Tweeddale and Sir George Arthur, on occasion of their appointment to the Governorship of the Presidencies of Madras and Bombay; Sir J. Lushington, chairman of the Company, in the chair. Among the company present were the Duke of Wellington, Sir R. Peel, Lord Stanley, and several other members of the Cabinet, together with a distinguished circle of noblemen and gentlemen, in number about 140. After dinner the usual loyal toasts were given; after which the chairman proposed the healths of the Marquis of Tweeddale and Sir G. Arthur, and success to their governments in their respective presidencies. The Marquis of Tweeddale and Sir G. Arthur briefly returned thanks. The Navy and Army were then given, which were respectively acknowledged by the Earl of Haddington and Lord Hill. The chairman then proposed the health of Sir R. Peel and her Majesty's Ministers. Sir R. Peel returned thanks. They were, he said, met on an occasion of peculiar interest. It was impossible not to wait with interest at least for the full explanation and development of those events in India, of which, hitherto, they had received but partial and imperfect accounts; but though they could not divest themselves of those feelings of deep interest, there was no occasion for apprehension or distrust—there was no occasion for any other feelings but those which are most becoming to an Englishman—the firm determination to repair any disaster they might have met with, and to overcome every difficulty with which they might be encompassed in the administration of affairs in India. When he recollected that there never was a period when there existed a more intimate, cordial, good understanding between the executive authority in this country and the East India Company—when he reflected on the high character and qualifications of the civil servants of the Company in India—when he reflected on the valour of the united armies that are rivalling each other in the field of glory in a friendly competition—when he recollected that this country is still blessed with the advice and counsel of that illustrious man who in India displayed that extraordinary combination of moral and intellectual qualities, which he has evinced alike in military and civil government during his after life—when he reflected on this combination of advantages, so far from seeing any occasion for despondency or alarm, he felt assured that every difficulty would be overcome, and that the trials to which they might be exposed would, being surmounted, only lay the foundation for the increased stability and enduring success of our Indian empire. The health of the Duke of Wellington was then given. The Duke, in returning thanks, said, that having had the honour of serving the East India Company—having lived for some years in that country under the protection of their government, and having witnessed the benefits conferred upon the natives of the vast regions under their sway, it was not surprising that he should on all occasions have felt an anxiety with respect to the choice of those individuals who are to govern the different portions of the territory forming their mighty empire. Upon no occasion had he been more satisfied with the choice announced than upon the present evening. Several other toasts were afterwards given, among which were those of the President of the Board of Trade, and Lord Ellenborough, Governor-General of India.

Custom House.—On Wednesday one of the most extensive seizures that has occurred for some years was made by the officers of customs on board a vessel lying in the River. It seems that, from information they had received, the officers determined to search her. The cargo at first appeared to consist of tierces of beef and other articles; but it was soon found that, instead of beef, the casks, to the number of 40, contained bags of snuff closely packed, the contents of each cask weighing upwards of 3½ cwt., the duty upon which would have amounted to nearly 5,000*l.* The whole of the seizure was removed to the Custom-house stores.

Public Meetings.—On Saturday, a meeting of the Marylebone vestry was held for the purpose of considering the following motion, relative to the police-force in that parish, of which notice had been given by Mr. Tufnell, M.P.:—"That a committee be appointed to report the number of police stations and policemen employed in the parish, and to ascertain whether the amount levied for the maintenance of the police force is a fair proportion as compared with that levied on other Metropolitan districts." Mr. Tufnell addressed the meeting at some length in support of his motion, and during his speech stated that under the old system, the watch of Marylebone, which he said had been admitted by Sir R. Peel to be very efficient, consisted of 197 persons, and the annual expense was under 10,000*l.* That the present police force in the parish consisted of one superintendent, four inspectors, twenty-five sergeants, and 181 constables, which, were they properly assessed, ought not to cost the parish more than 10,734*l.* annually; but, in addition to about 6,000*l.* from the Consolidated Fund, the cost of the police annually amounted to 27,176*l.*; an amount sufficient for double the number of men engaged, and for the police employed in other districts. St. George's, Hanover-square, he said, only paid for police the annual sum of 14,426*l.*; St. James's had 169 constables, and only paid annually 5,941*l.*; while Marylebone, for 181 constables, had to pay directly 20,382*l.*, and indirectly 27,176*l.* Lambeth, with an area of 3,640 acres, and having 167 constables, only paid 8,282*l.*; Kensington had 179 constables, and only paid 5,981*l.*; the parish of Islington had 578 constables, and only paid 13,407*l.* annually; and the small parish of St. Paul, Covent-garden, paid only 987*l.*, and had no less than 139 constables. Mr. Tufnell concluded a long address by saying that he did not wish to raise the amount of other districts, but he thought Marylebone ought to be reduced to its fair and proper proportion. He considered the police system as the very worst possible system of tyranny, and, unless the police commissioners thought proper to remedy this evil, he should certainly feel it his duty to bring this subject before Parliament. Several gentlemen then addressed the meeting, and after some observations on the inefficiency of the present police as a detective force, which it was urged had been evidenced by the recent circumstance of Daniel Good having made his escape and evaded the hands of justice for fifteen days, the motion was unanimously adopted.—On Monday, pursuant to advertisement, a public meeting was held for the purpose of receiving the report of a committee on the best means of testifying the public gratitude to the late Dr. Birkbeck for his services in promoting the education of the people, and especially the working classes. Lord Brougham took the chair, and briefly explained the objects for which the meeting was convened. Mr. Hume, M.P., then proposed the first resolution, which was seconded by Mr. R. Taylor, that "It is the opinion of this meeting, that upon the sound education of the great body of the people mainly depend, under Divine Providence, the stability and happiness of nations; and that mechanics' institutions have greatly contributed to that education by the direct instruction and by the rational recreation which they afford to the working classes." Lord J. Russell next addressed the meeting. He adverted to the benefit mankind had derived by the establishment of mechanics' institutions by Dr. Birkbeck, and proposed the second resolution, which was seconded by Mr. Basil Montagu, "That this meeting desire to record their deep sense of the eminent services which Dr. Birkbeck has rendered to the education of the people, by founding in 1800 and teaching a class for mechanics at Glasgow, by his munificent aid in founding and his constant care in superintending the London Mechanics' Institution, and by his ready assistance in forming similar bodies throughout the kingdom." It was then moved by Lord Dudley Stuart, seconded by Mr. Dillon, "That this meeting approve and adopt the Report of the Committee appointed on the 3d Aug. last, and are of opinion that the most fitting method of testifying the public gratitude to Dr. Birkbeck is by founding in University College, London, a Professorship of Machinery and Manufactures, including the Application of Chymistry and other branches of Natural Philosophy to the Arts; that the Professor be required to lecture in the country during the college vacation; and that a subscription be commenced for this purpose. All the resolutions were adopted."—On Tuesday, the Annual Meeting of the Metropolitan Anti-Corn-law Association was held, Mr. Warburton, late M.P. for Bridport, in the chair. The secretary read a long report, and a series of resolutions expressive of the dissatisfaction of the meeting at the course which had been pursued by Government with regard to the non-abolition of all monopolies, more particularly in corn, and the restrictions on the industry and commerce of the country. The meeting was addressed by the chairman, Earls Radnor and Kinnaird, Mr. Villiers, M.P., Mr. Hume, M.P., and several other members of Parliament, and gentlemen who were on the platform. After a number of speeches, the report and resolutions were finally adopted.—A public meeting was held on Wednesday of the electors of the City of London, for the purpose of calling on Lord J. Russell to resign his seat as representative of the City, on account of his "factious opposition to the tariff and other measures of Sir R. Peel's administration." The proceedings of the meeting were throughout of a noisy character. A Mr. Chilcot took the chair, and after he had briefly addressed the meeting, a resolution was proposed and seconded that the meeting highly approved of the conduct of Lord J. Russell. Mr. Wilkinson opposed the resolution in a speech of some length, and concluded by moving an amendment, "That this meeting approves of the measures proposed to Parliament by the Ministers of the Crown, on the whole, as calculated to better the condition of the working people, improve trade and commerce, and increase the revenue; that we regret the retarding of their accomplishment by a futile and factious opposition, and deprecate the conduct of Lord John Russell, who, as one of the Members of Parliament for this City, ought, to the utmost of his power, to expedite rather than retard so great a good, and thereby put an end to that state of uncertainty which at present paralyses the trade and commerce of the country." After several other persons had spoken, the amendment was put, and declared, amid considerable noise and confusion, to be carried by a large majority, though the supporters of the original resolution maintained that it was negatived by 20 to 1.—On Wednesday a public entertainment was given by the Colonial Society to Sir Allan M'Nab, as a proof of the feelings entertained towards him by gentlemen connected with Canada, and the British public in general, in respect to his late exertions in the loyal cause in Upper Canada. On his health being proposed, Sir A. M'Nab returned thanks at considerable length. He took a general review of the late events in Canada, and concluded by saying that there existed a strong feeling of loyalty among the people of that country; and that they were determined to maintain the connexion with Great Britain.

Metropolitan Antiquities.—A discovery of ancient coins has been made by some men employed in digging a new sewer under the foundation of Temple-bar. They consist chiefly of old copper coins and a few of gold, said to be of the reign of Charles I.

The Art Union.—The sixth annual meeting of the members of this society, for the purpose of distributing the prizes, was held on Tuesday at Drury-lane Theatre. Mr. Bond Cabbell, in the absence of the Duke of Cambridge, who was prevented from attending by a slight accident, was called upon to preside. The theatre was crowded with visitors, and presented an interesting sight. The secretary read the yearly report, announcing the amount of subscriptions for this year to be 12,905*l.*, of which 8,900*l.* were allotted for the purchase of pictures, and 400*l.* for casts. It was also recommended in the report that a reduced model of some celebrated piece of sculpture should be introduced among the prizes; and secondly, that the society should extend its patronage to the art of medal engraving, to which end it was suggested that a series of medals, illustrating the history of British art, should be commenced, and one die engraved every year, for which 100*l.* should annually be set aside. Two scrutineers were then elected, and two ladies appointed to draw the prizes, which were divided as follows:—1 of 400*l.*, 1 of 300*l.*, 2 of 200*l.*, 3 of 150*l.*, 6 of 100*l.*, 6 of 80*l.*, 8 of 70*l.*, 10 of 60*l.*, 14 of 50*l.*, 20 of 40*l.*, 26 of 30*l.*, 30 of 25*l.*, 44 of 20*l.*, 40 of 15*l.*, 60 of 10*l.* In addition to these, 20 bronze casts and 10 of plaster were distributed. The ceremony of drawing being concluded, a vote of thanks was given to Mr. Macready for the readiness and affability which he had shown in affording the use of his theatre.

Mortality in the Metropolis.—The following is the number of deaths in the Metropolis from all causes, registered in the week ending Saturday the 16th inst.:—males, 414; females, 480; total 894. Weekly averages, 1838-9-40-1: males, 467; females, 445; total, 912.

Camberwell.—On Monday a vestry meeting of the inhabitants was held, for the purpose of determining the amount to be expended in the rebuilding of the parish church. The Rev. J. G. Storie, vicar, took the chair. There were between 700 and 800 persons present; and after six hours' discussion, during which time the proceedings were occasionally very violent, a resolution was adopted to expend 12,000*l.*, in addition to the 3,600*l.* received from the insurance-office; 8,000*l.* to be raised by Exchequer-bills, and the remainder to be collected by two rates. A determined opposition was then made as to the appointment of a committee, one party wishing for a reappointment of the old one, while the opposite side insisted on having some new names inserted. It was ultimately determined that there should be a poll of the whole parish, which is appointed to take place in a few days.

Provincial News.

Bradford.—The magistrates, bankers, and merchants of this town, interested in the long wool trade, have recently petitioned the Board of Trade for such a modification of the tariff with regard to the exportation of British wool as would afford adequate protection to English manufacturers. An answer has been received on the subject, in which the Lords of the Committee of Privy Council for Trade state that they are not prepared to accede to the prayer of the memorial.

Dudley.—On Monday some serious disturbances occurred among the workpeople of this town, Stourbridge, and other parts of the iron manufacturing districts, which for some time threatened serious consequences, and rendered it necessary to call in the assistance of the military from Birmingham. The following appear to be the authentic particulars of these riots, and of the causes which led to them:—A short time since a number of the ironmasters in the neighbourhood reduced the wages of their workmen, upon which many of the men, chiefly nailors, refused to resume their employment; while others continued to work at the price offered. It seems, however, that those who "struck" determined to compel the masters to pay the old prices, or to drive away from the various manufactories those men who still continued to be employed in them. For this purpose, on Monday some thousands of workmen congregated from Lye Waste, Craidley, and Netherton, and proceeded to visit the works of several of the most influential masters of this manufacturing district; and upon being told that the reductions made were in consequence of similar reductions by competing manufacturers, they proceeded to seize the masters and violently force them into their ranks: in this manner several of the principal ironmasters and manufacturers were seized while on their own premises, and marched in procession to this town. On their arrival the mob escorted their prisoners to the hotel, for the purpose, it is said, of confronting them with the other masters to whom they had alluded. The streets were at this time densely crowded with people, considerable excitement prevailed, and the shops were generally closed. The ironmasters remained in the hotel some time in consultation with the magistrates; when the mob, becoming impatient, proceeded to further extremities, and attempted to force the building. The Dragoons however, who had been sent for from Birmingham, fortunately arrived before they had accomplished their purpose; and the Riot Act having been read, they were soon after dispersed, but not until 12 of their number had been seriously wounded, and 40 of the ringleaders captured. In the evening a large body of police were sent by the authorities in Birmingham to render any assistance that might be requisite. The rioters, after retreating upon the entrance of the troops, proceeded to the out-manufacturing districts, and on Tuesday it was stated by persons arriving from the neighbourhood, that they had congregated in great numbers at Rowley-Regis, Craidley, and other adjacent places, where considerable excitement prevailed, and further disturbances of a serious character were expected. The magistrates immediately took active measures to preserve the peace, aided by the Lord-Lieutenant of the county, Lord Littleton; and on Wednesday, alarming reports being still current, fresh reinforcements were sent for. In the course of the day, a troop of the Worcestershire Yeomanry, accompanied by two pieces of artillery, arrived; and nearly a troop of the Enniskillen Dragoons were stationed in the town, the rest of the two troops being quartered in the neighbourhood of Lye Waste, Stourbridge, Hales Owen, and other places. On Wednesday a public meeting of the Chartists was called, when they were addressed by Mr. Cooke, of this town, and Mr. Candy, from Yorkshire, on the necessity of union, and the advantages that would result from the people's charter. All passed off quietly, and it was resolved to appoint a deputation of working men to meet the master nailors. It was also understood that, until these delegates had made a report to the meeting, the workmen would abstain from outrage; but that if the deputation did not meet with a satisfactory reception, proceedings of a violent nature might be anticipated.—The latest accounts inform us that no fresh disturbances had taken place. The deputation of the working-classes have had a conference with the masters; and, it is stated, have expressed themselves generally satisfied with the disposition of those assembled to meet their views so far as circumstances permit them. The ringleaders of the mob who were taken on Monday have been examined by the magistrates, and committed.

Liverpool.—A public meeting of the merchants, shipowners, builders, and others connected with the timber trade, has been held in this city, for the purpose of considering the propriety of memorialising Government to allow the proposed change in the timber duties to come into immediate operation. Mr. T. Sands, chairman of the Dock Committee, took the chair. Mr. Robinson said, as chairman of the British North American Association, he begged to protest against that being considered a meeting of the timber trade. Mr. Brereton, timber-merchant, also made a similar protest, after which he and Mr. Robinson left the meeting. Several gentlemen then addressed the meeting, and the following resolutions were finally adopted:—1. "That the prices current for North American timber in the port of Liverpool throughout the whole year ending 1st Feb., 1842, have not only been unremunerative, but ruinous, both to importer and shipowner." 2. "That the prices now current for North American timber are below the rates at which it can be remuneratively imported for sale, even under the proposed new scale of duties." 3. "That the consequence of any protracted delay would tend to injure all parties, without benefiting or alleviating any one interest, inasmuch as postponement will at once check consumption, and cause a comparative cessation of all general contemplated operations, and thus, in effect, paralyse the trade both at home and abroad for 1842." 4. "That whatever the result may be with regard to the proposed alteration of the timber duties, it is highly expedient, as regards the future welfare of the merchant and colonist abroad, and also the merchant, shipowner, and manufacturer at home, that that alteration should come into immediate operation, and not be delayed until the 10th of October." It was also resolved that a memorial, embodying these resolutions, be forwarded to Government.

Luton.—A public meeting of the inhabitants of this town and neighbourhood has been held, to take into consideration the proposed reduction of duty on foreign plait and bonnets, and the serious injury it is likely to occasion to the town and neighbourhood, and plaiting districts generally, and more especially to the manufacturing poor. After several gentlemen had addressed the meeting on the subject, the following resolutions were adopted: 1. That the proposed reduction of duty on foreign plait and bonnets will materially injure the interests of the manufacturing poor throughout the plaiting districts, amounting to upwards of 150,000 individuals. 2. That it will seriously injure every part of the trading community throughout the plaiting districts of the kingdom. 3. That by depriving a large proportion of the manufacturing poor of the means of subsistence, it will considerably increase the poor-rates, and necessarily bring upon the agriculturists a very heavy additional burden. 4. That the manufacture of British straw plait, which is carried on by women and children, and by the surplus agricultural labourers, deserves the encouragement and protection of the legislature, particularly because no machinery is used in its production. 5. That foreign hats and bonnets will be introduced within the restricted size of 22 inches in diameter, weighing 1lb. each, for 1*s.* 8*d.*; and, therefore, no plait will be imported but such as is made up into hats and bonnets, or baskets, and the intended duty of 7*s.* 6*d.* upon plait will be avoidable, fallacious, and in every sense a dead letter. 6. That the alleged reason for so great a reduction of the existing duties upon foreign plait, namely, that large quantities are smuggled into this country, is not, in the opinion of this meeting, founded upon fact; for had such been the case, it must have been known to the manufacturers of Luton, who have extensive connexions in every part of the kingdom. 7. That petitions be presented to both Houses of Parliament, embodying the resolutions of this meeting.

Portsmouth.—A serious fire has occurred in this town. It broke out in an extensive store situate at the corner of Lombard-street, filled with a large quantity of tar, hemp, oakum, and other combustible materials. The fire spread with great rapidity, and soon communicated to the adjoining houses. By the exertions, however, of the police, aided by a body of soldiers, and the sailors from the different ships of war, the flames were at length got under, though not before considerable damage had been done, several houses, in addition to the stores, being burnt down. The cause of the fire is not known, but it is supposed to have originated from spontaneous combustion.

Southampton.—A young man, named Thomas Maslin, has been examined before the magistrates in this town, charged with an attempt to commit murder and suicide. It appeared, from the evidence of several witnesses, that the prisoner, who is a stranger in the town, went a few evenings since into a shoemaker's shop, above Bar, and, without any provocation or ostensible cause, made an attempt to cut the throat of an errand-boy in the shop, with a knife which he had asked for to cut his boot, which pinched him. Not succeeding in his attempt, though he inflicted a severe wound in the boy's chin, he endeavoured to stab himself, but failed, and was then taken into custody. At his examination, he declined saying anything, and was committed to take his trial. A medical witness stated that the prisoner was at the time labouring under strong excitement; that he was not, however, intoxicated, but appeared to have been recently suffering under severe illness; and from the peculiar formation of his head, he was of opinion that there was some organic derangement, though he could not pronounce him decidedly insane.

Wales.—Great excitement has prevailed for the last few days in Hawarden, North Wales, near the seat of Sir S. Glynne, Bart., in consequence of the turn-out of all the hands working in the extensive collieries of Messrs. Rigby and Hancock, and the attempts of these men to cause other operatives in collieries to turn out and support them in their demands. The question in dispute appears to be of a similar nature to that which recently occurred between Messrs. Grissell and Peto and their workmen, respecting the appointment of a superintendent. A gentleman, named Staley, has hitherto been the agent appointed to carry on the collieries; and having for some reason rendered himself obnoxious to the men, they refused to work, and, assembling in great numbers, demanded his dismissal. This not being acceded to, they proceeded to measures of violence; and having seized Mr. Staley, treated him very roughly. They placed him in a coal-waggon, conveyed him towards the river Dee, and expressed their determination to drown him. On arriving at the Queen's-ferry, however, they stated that his life would be spared then, but only on condition of banishment to England. He was then placed in the ferry-boat, the colliers threatening vengeance if ever he dared to return. Information was given to Mr. Leigh Rigby of the outrage, and as soon as the mob had dispersed from the ferry he conveyed Mr. Staley in his carriage to his house at Hawarden; but the colliers having learned where he was concealed, he was obliged to make his escape the same night; and in the morning, 300 of the workmen surrounded Mr. Rigby's house, demanding that Mr. Staley should be sent out of the country.

Mr. Rigby informed them, that if they were determined to select their own masters they should no longer work for him. They then went to the rest of the coal-mines, endeavouring to get the colliers to strike work ; and the result has been, that the men are now generally demanding higher wages, and four of the underground superintendents of the mines have been compelled to leave the place from threats of violence. The magistrates have taken precautions for preserving the peace, and for calling in the military should any further violence be offered. Several houses have since been broken into, and it is expected that the ringleaders will be taken into custody. The police force of the neighbourhood appears to be inefficient in strength ; and Mr. Staley, it is said, dare not enter Wales to identify his persecutors.

Wigan.—A riot, which at one time threatened serious consequences, has occurred in this town. It appears that a large body of the handloom weavers, consisting chiefly of the lower orders of Irish, went to the office of the poor-law guardians, and demanded relief for themselves and their families. This was refused, when they became irritated, broke into the board-room, and took possession of the papers, threatening to use violence towards the guardians and officers of the union, unless their wants were supplied. The excitement became so great, that the mayor and other magistrates of the borough, who are also guardians, deemed it necessary to call out the military, and to read the Riot Act, upon which the mob dispersed. The excitement among the people continued some time, and further disturbances were apprehended, but none have since taken place. A public meeting has been called to take into consideration some means of relieving the weavers,

Windsor.—Several extensive alterations are now proceeding in the interior of the Castle, especially in those portions of the private apartments occupied by her Majesty and Prince Albert, and the Duchess of Kent ; and also in those appropriated to the nursery. The apartments upon the principal floors of the whole of the southern and eastern sides of the Castle, which have hitherto been heated by warm air, are in future to be warmed by the aid of heated water. The nursery, and the several rooms connected with that department, are now being permanently finished and embellished ; the work which had been previously executed in these rooms having been of a temporary nature, and completed with the rapidity necessary at the time. Several of the bedrooms on the south side of the quadrangle are also undergoing great improvement. The rooms are to be brought forward to the outer windows, and the passage, which will be lighted from above, is to proceed between these rooms and another suite of apartments looking towards the south, and down the Long Walk. There are at present upwards of 200 workmen employed under the direction of Mr. Blore, the architect, who has succeeded Sir Jeffry Wyattville as the superintendent of the works.—The Commissioners of Woods and Forests have determined on removing all the old and useless buildings on the Crown lands in this borough, and the old military hospital on the Frogmore estate was sold by auction on Thursday. The building was formerly occupied as the infantry hospital by the regiments in garrison, until the new hospital had rendered it useless.

Worcester.—On Monday a public meeting by requisition was held in this city for the purpose of considering the propriety of petitioning Parliament against a continuance of warlike operations in China and Affghanistan, and expressing anxiety that measures may be taken for conciliating the inhabitants of those regions, and staying the war spirit, as being altogether at variance with the Christian religion and the true interests of mankind. Mr. S. Pumphrey moved a series of resolutions in conformity with the objects of the meeting, which Alderman Padmore seconded, and which, after the meeting had been addressed by Mr. Price, of Neath, in a speech of some length, were adopted, and a petition founded thereon agreed to.

Railways.—We learn from the "Railway Times" that all the Railway Companies are combining their exertions to procure a modification of the passenger tax, and that a deputation from the united body have had an interview with the Chancellor of the Exchequer on the subject ; the result of which, however, has not been made known.—On Tuesday an accident occurred on the Liverpool and Manchester line of railway, which might have been attended with fatal consequences had it occurred a few minutes later. It appears that near the Warrington junction a tram-road crosses the line leading from a colliery to the Grand Junction line ; and while an engine belonging to the colliery was attempting to cross the line, it came in contact with another engine, to which were attached some empty coal-waggons. The concussion threw both engines partially off the rails, and considerable damage was done to both. Fortunately both were proceeding at a slow pace, or it is thought that the engineers and firemen would have been killed on the spot ; or had the crossing been attempted a few minutes later the engine would have come in contact with a second-class train from Liverpool, and a still more serious accident would have been the result. Some time elapsed before the engines could be got away ; but in consequence of the accident happening between the points where the Grand Junction joins the line for Liverpool and Manchester, the passenger trains, by passing along that line a short distance, were enabled to pursue their journey without much delay.—On Thursday a special general meeting of the proprietors of the South-Eastern Railway was held, to consider and determine on raising additional capital for the purposes of the undertaking. A statement was submitted, by which it appeared that the receipts of the company to the 1st April were 356,745*l.*, and the total from the commencement 1,145,597*l.* 13s., whilst the expenditure amounted to 312,977*l.* for the half-year, and the total to 1,075,468*l.* 5s. 4d., leaving a balance, after some other deductions, of 62,461*l.* 5s. 8d. The Chairman said that in addition to the above total expenditure, the additional sum required would amount to 1,545.000*l.*, and was made up as follows :—Cash balance, 70,000*l.*, engagements 35,000*l.*, debentures 360,000*l.*, sum proposed to be raised 700,000*l.*, the sum the company has power to borrow 260,000*l.*, and that under the London Bridge Station Act 120,000*l.*, which would leave a margin ample for all that might be required. From this the amount due to the Brighton Company (said by them to amount to 350,000*l.*,) would be taken. The distance that would be opened in the month of May would be 40 miles ; 8 to Croydon, 12 on the joint or Brighton line, and 20 miles on the South-Eastern line. In the month of August 15 miles further would be opened, in November 11 miles further, making the whole distance from the Metropolis 66 miles. The chairman then submitted a resolution for raising an additional capital of 700,000*l.* by the issue of 28,000 new shares, for 50*l.* each nominally, 25*l.* each in cash only being required, and also several other resolutions, which were carried unanimously. In reply to several proprietors, the chairman stated the loss by shares to the company was about 235,000*l.*, and that the directors still remained of opinion that the line would ultimately not cost more than 30,000*l.* per mile. After some discussion on the affairs of the company, some gentlemen from France explained to the meeting the project of a railway from Calais to Paris, and one from Boulogne to Paris, which they considered preferable, but which, they said, had not been decided on by the Chamber of Deputies. Several proprietors spoke in favour of a line from Calais to Paris, and thought an opinion of the kind expressed in a resolution would be advisable, but it was overruled by the rest of the meeting.

IRELAND.

Dublin.—A few days since the Recorder of this city pronounced judgment in the Sessions Court on a point which has excited much interest among the corn-dealers. The question was as to the correct legal weight of the barrel of oats ; whether it was 14 stone only, according to a certain Act of Parliament, or 14 stone 2lbs. (measurage), according to a general and long-established custom in the trade ? The recorder decided that the barrel consisted of 14 stone only, i.e., of 196lbs., and not of 198lb., according to the custom, which he therefore pronounced illegal. —The emigration from this country, alluded to in former Numbers, still proceeds upon a scale much more extensive than in any former year ; and a large portion of the emigrants are said to be farmers. The number of persons who arrived at Quebec from Cork in 1841 was 1,401 ; from Limerick, 2,547 ; from Waterford, 748 ; from Tralee, 906 ; and the total arrived from all parts of the country was 18,317. In the present year, since the 10th March, 18 vessels have sailed from the port of Cork alone, with 3,690 passengers, who took their departure for the following ports :— St. John's, 1,542 ; Quebec, 1,211 ; New York, 733 ; St. Andrew's, 204. It is also announced that several other vessels will clear out from the same port before the end of the season. Accounts from Limerick state that the spring-tide of emigration is now at its height in that port ; that five vessels, full of passengers, left for America on Saturday, three others having sailed a few days previously ; and that several ships are still taking in emigrants, and will sail shortly for the same destination. A Drogheda paper states that the number of emigrants who passed through that town for America, since the season for emigration commenced, exceeds, at a moderate computation, 4,000 ; principally from the counties of Meath, Louth, Longford, and Cavan. We are also informed by a Mayo journal that in Newport, Westport, and Ballina, several large vessels are taking in passengers for the British American colonies, or the United States, to a much greater extent than has been witnessed on any former occasion.—The weekly meeting of the Repeal Association was held on Tuesday, Dr. Murphy in the chair. The secretary read the minutes of the last day's proceedings, and then in a speech of some length alluded to the progress of the repeal cause in London, which, he said, was principally supported by ladies. He next drew a comparison between the wealth and prosperity of London and the poverty and embarassment of this city, and called upon the country to rally in favour of the repeal. He then read a long letter from Mr. O'Connell on the subject of repeal, but it contained no new topic of interest. A letter was also read from Trey, in America, inclosing 44*l.*, and expressing the determination of the contributors "to unite their sympathies and efforts with Irishmen in their endeavours to recover their liberties." The letter was inserted on the minutes.

Belfast.—Intelligence has been received, announcing the suspension of payment of Messrs. Curell and Sons, manufacturers, of this town. It is, however, supposed that time only is required to enable them to meet their liabilities.

SCOTLAND.

Aberdeen.—A singular trial took place in this city, at the Circuit Court of Justiciary, on Saturday. Two persons were tried for setting their premises on fire, to defraud the insurance-office. The trial lasted throughout the night, and till seven o'clock on Sunday morning. The jury found one of the prisoners guilty of wilful "fire-raising," and the other guilty as an accomplice, but recommended them to the leniency of the Court, "on account of their previous good character, of their being strangers in this country, and also on account of the circumstances under which the trial is concluded." The Court did not rise until twelve on Sunday forenoon.

Glasgow.—Lord Brougham has been chosen Patron of the Mechanics' Institution in this city, in the room of the late Dr. Birkbeck.

Leith.—The local papers announce that the Banking Company in this town has suspended payment. It is, however, stated that the firm is likely to meet all demands upon it in full.

THEATRICALS.

HER MAJESTY'S THEATRE.—A numerous audience was attracted to this theatre on Tuesday night by the *début* of Signora Frezzolini, who has for some time been expected in this country. She appeared in the character of *Beatrice di Tenda*, in Bellini's Opera of that name ; and her success was decided. Signora Frezzolini is a native of the Roman states, where she has already played with great success ; about 33 years of age, and is married to Signor Antonio Poggi, a tenor of considerable reputation, who is also engaged at this theatre. Her voice is a soprano, of considerable power, her execution is finished, and her style graceful and elegant. She was favourably received, and her performance met with frequent applause. The rest of the Opera was well sustained, and SS. Ronconi and Guasco were both encored in some parts of their performances. The theatre was well filled, and her Majesty and Prince Albert were present. At the fall of the curtain Signora Frezzolini was called for, and received the congratulations of the audience.

SPORTING.

Newmarket First Spring Meeting.—These races commenced on Monday, under favourable circumstances as respected the weather, which has continued very fine throughout the week, and the company was numerous and fashionable. The races began with the

Handicap Sweepstakes of 20 *Sovs. each. T. Y. C.* (8 *Subs.*)—Col. Peel's Hawk's-eye (Chapple), 1 ; Mr. Goodman's Rover, 2 ; Capt. Daintree's c. by Mulatto, d. by Middleton, 3. Betting, 10 to 6 agst Hawk's-eye, and 5 to 1 agst Rover. The three horses placed lay in front all the way, Rover making play at a strong pace till close to the chair, when Hawk's-eye made a rush and won by a head.

Sweepstakes of 50 *Sovs. each. T. Y. C.* (6 *Subs.*)—Mr. Bowes's The Ladye of Silverkeld Well (Scott), 1 ; Mr. Thornhill's Eusebia, 2 ; Fulwer Craven's Don't-say-no, 3. Betting, 6 to 4 agst Eusebia, 7 to 4 agst Don't-say-no, and 5 to 2 agst the winner. Don't-say-no cut out the work to the cords, and then ran out ; the other two went on and made a close race home ; The Ladye winning by half a length.

Sweepstakes of 10 *Sovs. each. T. Y. C. The winner to be sold for* 200*l.* (8 *Subs.*)—Mr. B. Green's c., by Wiseacre out of Zany's dam (Rogers), 1 ; Lord Albemarle's Robin, 2 ; Mr. Price's Marshal Biron, 3. The following also started but were not placed : Lord Exeter's Patchwork, Mr. Crockford's f. by Buzzard out of Emma, Mr. Goodman's f. by Ishmael out of Balance, Capt. Colquitt's Astronomer, Mr. Barnes's br. c. by Emilius out of Benefit's dam. Betting, 3 to 1 agst the Wiseacre colt, 3 to 1 agst Emma c., 7 to 2 agst Patchwork, and 4 to 1 agst Robin. The Wiseacre colt, agst the will of his jockey, made nearly all the running to the cords, where Robin headed him, but was caught again near the chair, and beaten by a neck ; Marshal Biron and Patchwork nearly abreast at the finish.

Sweepstakes of 20 *Sovs. each. D. M.* (3 *Subs.*)—Duke of Rutland's Flambeau (Robinson), 1 ; Mr. Ford's Ballet, 2. Betting, 2 to 1 on Flambeau, who took the lead, kept it, and won easy by a length and a half.

Sweepstakes of 50 *Sovs. each. A. F.*—Mr. Combe's Rosalind by Touchstone (Rogers), 1 ; Mr. Biggs's Eleus, by Elis, 2 ; Mr. Goodman's f. by Ishmael, out of Balance, 3. Betting, 6 to 4 on Eleus, 2 to 1 agst Rosalind, and 6 to 1 agst the Balance filly. The Balance filly made all the running for nearly half a mile, and was then passed by Eleus, who went on at a wretched pace to the bushes, where Rosalind collared him, and won, after a short struggle, by a head.

50*l.* *Last three miles of B. C.*—Duke of Rutland's Flambeau (Robinson), 1 ; Mr. Thornhill's E. O., 2 ; Duke of Grafton's Florence, 3. Betting, 6 to 5 agst Flambeau, and 3 to 1 agst each of his opponents. Florence made running at a good pace, E. O. waiting on her, and Flambeau behind ; so they ran till half way between the Duke's Stand and the chair, when the mare and the old horse taking the lead, made the rest of the running, and won easy by two lengths.

TUESDAY.—The unusual warmth and fineness of the weather attracted great numbers of visitors, and the heath presented an animated scene. The races commenced with

The Queen's Plate of 100 *guineas. R. C.*—Mr. Batson's Barbara (Sly), 1 ; Mr. Sadler's Bellissima, 2 ; Duke of Grafton's Florence, 3 ; Mr. Turner's The Jewess, 4. Betting, 10 to 6 agst Barbara, 3 to 1 agst Florence (taken), and 3 to 1 agst Bellissima. Won in a canter by four or five lengths ; a regular tailing race.

The 2,000 *Guineas Stakes, a Subscription of* 100 *Sovs. each. R. M.* —Mr. Bowes's Meteor, by Velocipede (Scott), 1 ; Mr. Wreford jun.'s Wiseacre by Taurus, 2 ; Mr. Goodman's Rover, 0 ; Lord G. Bentinck's Misdeal, 0 ; Col. Peel's Archy, 0 ; Lord Exeter's Saros, 0 ; Lord Orford's br. c. by Jerry out of Petulance, 0 ; Mr. Ridsdale's Lucullus, 0. Betting, 6 to 4 agst Meteor, 5 to 2 agst Misdeal, 9 to 2 agst Petulance c., 7 to 1 agst Wiseacre, and 10 to 1 agst Archy. Won by half a length.

WEDNESDAY.—50*l.* *Plate. B. C.*—Lord Kelburne's b. c. by Muley Molock, walked over.

Handicap Sweepstakes of 20 *Sovs. each. A. F.*—Mr. Sadler's Bellissima, (J. Day,) 1 ; Mr. Biggs' Eleus, 2 ; Mr. Thornhill's St. Colomb, 3 ; Duke of Rutland's Sir Hans, 4. Betting, even on Eleus, 3 to 1 against Sir Hans, and 7 to 1 against Bellissima. Bellissima made all the running, and won easy by half a length.

Sweepstakes of 100 *Sovs. each. D. M.*—Col. Anson's Attila, (Scott,) 1 ; Mr. Etwall's Palladium, 2 ; Mr. Osbaldeston's The Devil among the Tailors, 3. Betting, 7 to 2 on Attila. The Devil among the Tailors went away as hard as he could split, Palladium second, and the favourite third ; they ran so for half a mile, and then Attila took the lead at an improved pace, got rid of the Devil instanter, shook off Palladium at the cords, and won in a canter by six lengths.

THURSDAY.—*Sweepstakes of* 50 *Sovs. each. T. Y. C.* (6 *subs.*)—Mr. Newton's f. by Jerry, out of Fanchon, (Robinson,) 1 ; Lord Orford's Bridal, by Bay Middleton, 2. The Fanchon filly made all the running, and won easy by three lengths.

The Queen's Plate of 100*Gs. R. C.*—Mr. Combe's The Nob, (Darling,) 1 ; Duke of Richmond's The Currier, 2 ; Mr. Batson's Barbara, 3 ; Duke of Rutland's Flambeau, 4 ; Mr. Thornhill's E. O., 5. Betting, 6 to 5 agst Flambeau, 7 to 2 agst The Currier and Barbara, and 4 to 1 agst The Nob. Won by a length.

Sweepstakes of 10 *Sovs. each. First half of Ab. M. Winner to be sold for* 80*l.* (5 *Subs.*)—Mr. Goodwin's Drummer Boy, 1 ; Mr. Goodwin's Ishmael, out of Balance, 2 ; Mr. Pettit's Sweetmeat, by Citron, 3. The following were not placed : Lord Exeter's Revision and Mr. Sare's Badwell Ash, by Colwick. Won by a length.

Handicap Sweepstakes of 25 *Sovs. each. T. Y. C.* (6 *Subs.*)—Mr. Crockford's f. b. by Buzzard (S. Darling, jun.), 1 ; Mr. Byng's Garry Owen, 2 ; Lord Kelburne's c. by Retainer, 3 ; Mr. Ford's Ballet, 4. Betting, 7 to 4 agst Ballet, 2 to 1 agst Garry Owen and the winner. A regular tailing race ; the Emma colt was never headed, and won by four lengths.

Sweepstakes of 10 *Sovs. each. T. Y. C. Winner to be sold for* 150*l.* 6 *Subs.*—Mr. B. Greene's ch. c. by Wiseacre (Rogers), 1; Mr. Pettit's Michaelmas-Day, 2; Lord Exeter's Patchwork, 3. The following also started: Capt. Daintree's b. c. by Mulatto dam by Bay Middleton, Lord Albemarle's Robin, and Duke of Portland's c. by Bay Middleton, out of Manto. Betting, 10 to 1 agst the winner, 3 to 1 agst Robin (t.), and 4 to 1 agst Michaelmas-Day (t.). The favourite waited on Patchwork and Michaelmas-Day till half-way up the cords, and then passed them and won easy by a length.

The 1,000 *Guinea Stakes, by Subs. of* 100 *Sovs. D.M.* (21 *Subs.*)—Lord George Bentinck's Firebrand (Rogers), 1; Lord Exeter's f. by Touchstone, out of Amima, 2; Mr. F. Wood's Eliza, 3; Mr. Thornhill's Equation, 0; Duke of Grafton's Utopia, 0; Mr. T. Coleman's Gazelle, 0; Mr. Etwall's Passion, 0. Betting, 7 to 4 agst the Amima filly; 7 to 2 agst Eliza (taken), 4 to 1 agst Passion and Equation. Won by a length.

Law.

COURT OF EXCHEQUER.—*The Bank of England* v. *Tomkins. The Exchequer bill Fraud.*—This case, which excited considerable interest, as connected with the recent frauds in Exchequer-bills, was tried before Lord Abinger, at the sittings after Hilary Term, at Guildhall; when a verdict was taken for the Bank—damages 8,000*l.* A motion was now made for a rule to show cause why the verdict should not be set aside, and a new trial granted, on the ground of misdirection on the part of the learned Lord who tried the cause. It appeared on the trial that the defendant had deposited 11 Exchequer-bills for 1,000*l.* each with the Bank, and that the Bank advanced 11,000*l.* on this security, under the agreement that if the money advanced was not forthcoming on a certain day, the Bank might sell the Exchequer-bills. The defendant paid 3,000*l.* within the time specified, and had back three of his Exchequer-bills, but the others remained in the plaintiff's hands, and those Exchequer-bills afterwards appeared to have been forged as respected the signature. Lord Monteagle said, on the trial, that his name, which appeared to the Exchequer-bills, was forged; and Mr. Percival, who was the only person authorised to sign Lord Monteagle's name, also swore that the signature of Lord Monteagle was a forgery. It clearly appeared, however, that the paper on which the Exchequer-bills was printed, the printing, and the stamp or seal of the Exchequer-office, were genuine. In other words, the Exchequer-bills which the defendant deposited with the Bank were genuine in every respect but as regarded the signature. It also appeared that Mr. Beaumont Smith, one of the chief clerks in the office of the Comptroller of Exchequer bills, had free access to the office, and might have put forth any number of those bills he liked into the world, which would be genuine in every respect, if they obtained the signature of Lord Monteagle. The bills deposited with the plaintiffs were thus issued from the Exchequer-office, with all the *indicia* of being genuine, and only wanted the signature of Lord Monteagle. Mr. Baron Parke said the case was quite clear. The Bank was to advance money on genuine bills. The bills deposited were forgeries. The Bank had, therefore, a right to demand the repayment of the money advanced. If the defendant had any claim on the Exchequer-bill Office, on the ground of negligence, that was entirely a different question. The defendant might bring an action on the case, or his claims would be taken into consideration with those of other persons who held forged bills. The other Barons concurred, and the bill was refused.

Thornton v. *Portman.—The Gurney Case.*—This case, which we noticed in a former Number, was tried before Lord Abinger, at the last sittings for London; when a verdict went for the plaintiff—Damages, 1,250*l.* An application was now made for leave to show cause why the verdict should not be set aside, and a nonsuit entered, pursuant to leave named on the trial. The facts as they appeared on the trial were, that Mr. Gurney had betted very considerably on the result of the Epsom races. It was an understood rule of the Jockey Club, that a person who did not pay his debts should not receive any. The defendant Portman, Clarke, and Banks were appointed the trustees of Mr. Gurney, and supposed that, if he were paid all he was owed, they should be able to pay all his creditors in full. Under this impression, and with the sanction of the Jockey Club, they received various sums due to Mr. Gurney; amongst others they applied to Mr. Thornton, who had lost a sum of 1,550*l.* to Mr. Gurney on the Epsom meeting. Mr. Thornton refused to pay unless the trustees guaranteed that all Mr. Gurney's debts should be paid in full. The defendants accordingly signed a written guarantee, to the effect that they received Mr. Thornton's debt conditionally, provided Mr. Gurney's Epsom account was paid by the 1st of November, 1840; but if his account was not paid, and 20*s.* in the pound paid to all his creditors, then the money paid by Mr. Thornton should be returned to him. It afterwards appeared that some of Mr. Gurney's creditors were paid in full, whilst with the others a compensation was entered into; and it was contended, on behalf the plaintiff, that, under those circumstances, the condition was not complied with, and there was a breach of the agreement. The application now made to the court was founded on the fact that the agreement was illegal, and could not be sustained.—Baron Parke said, it was contrary to law to gamble, but he was not prepared to say it was contrary to law to pay gaming debts. The Court did not decide in this case that the contract was illegal, but, under the new rules, if such a defence was to be set up, it must be specially pleaded. The other Barons concurred.—Rule refused.

ROLLS COURT.—*Ashton* v. *M'Dougall.*—Lord Langdale gave judgment in this cause, in which the bill was filed by Robert Ashton, the husband of Mrs. Ashton, formerly Miss Susannah Eliza Paddon, praying for an account against the representatives of the trustees of the settlement made upon Miss Paddon's first marriage, in June 1819, with James Harnett. Miss Paddon, who was at that time a minor, was entitled to considerable property under the will of her grandfather, John Stacie. After the marriage a bill was filed, and the settlement in question was executed under the directions of the court, in July 1819. Harnett died, leaving children. His widow married Edward Birch, who also died, and she afterwards married the plaintiff. Mrs. Birch and the Harnetts, her children, were co-defendants. His Lordship was of opinion, there was not any circumstance from which he could consider the settlement to be invalid There was no reason why a married woman with a settlement made for her benefit might not adopt that settlement on becoming single. Part of the property fell into possession during the life of the first husband. She did not require any assignment, but appeared to have married the second husband under the impression that he was bound by that settlement. After his death she married the plaintiff. If she had practised fraud, and had represented that he would become entitled to the property, the plaintiff might have had a case for relief; but that did not appear to be so. The property was settled to her separate use, and the plaintiff was aware of it, and acquiesced; he, therefore, was not entitled. But it was contended he was entitled to the income that accrued during the widowhood in the intervals between the marriages; that, however, was money due to the trustees for her separate use, and the plaintiff was not entitled to it. The bill must be dismissed with costs.

BAIL COURT.—*Hovell* v. *Foster.*—This was an action for false imprisonment. The plaintiff was a French lady's-maid, and the defendant the husband of her mistress. The circumstances which led to the present proceedings were as follows:—In July last, Miss Smith, the daughter of Mr. Smith, a merchant residing in Brunswick-square, married Mr. Foster, the defendant. The alliance was not approved of by the lady's family; but her father, to increase her comfort, sent for her use a considerable quantity of plate to the lodgings where Mr. and Mrs. Foster resided. Some months elapsed, and matrimonial differences arose, which terminated with the return of the lady to the home and protection of her father on the 2d Jan. Previously, as well as subsequently to the marriage, Mrs. Foster had a lady's-maid, a Frenchwoman, one Eliza Hovelt, and on leaving her husband's lodgings, then at the house of a Dr. Crane, Milton-street, Dorset-square, Hovelt was still in her service, and remained behind. On the same day a servant was sent by Mr. Smith to fetch away the above-mentioned plate, and, by the advice of Dr. and Mrs. Crane, it was given up by the plaintiff Hovelt, into the hands of this servant. Foster, the defendant, was from home at the time, and on his return was much irritated that the plate had been sent away. He called in a policeman, and consulted with him about the transaction, and, according to the evidence of the man, was told that no charge of felony would lie against the maid Hovelt, but he insisted that she should be taken into custody. The plaintiff was taken to the Marylebone police-station, where the inspector said that there was not the slightest ground for a charge of felony, and informed Mr. Foster that he was liable to an action. The accusation was then allowed to drop. The plaintiff was much excited and alarmed at the situation in which she was placed, and after the examination at the station-house fainted away, and though discharged, was unable to leave the place for some time. For such injury to her health and reputation compensation was now sought at the hands of a jury. On behalf of the defendant, it was argued, in mitigation of damages, that had he known that the Cranes had sanctioned the giving up of the property, no steps would have been taken against the plaintiff; that his conduct had been influenced by no vindictive feelings, as was proved by his not pressing the charge, as he might have done, at the station-house; that the plaintiff had suffered little or no damage, as she had since remained without any interruption in the service of Mrs. Foster; and, consequently, that the smallest damages would satisfy the justice of the case.—Mr. Justice Coleridge, in summing up, said that he should be sorry if an English jury ever treated an unfounded charge of felony as a slight or trivial matter; though in this case it did not appear that any direct or positive injury had arisen from it. Verdict for the plaintiff—Damages, 20*l.*

INSOLVENT DEBTORS' COURT.—*In re Henry Corsten.*—The case was formerly heard by the Chief Commissioner at considerable length. The insolvent was a seedsman and florist in the vicinity of Covent-garden market, and also at Shepherd's Bush, where it appeared that he had undertaken to rear some rare species of tulips, which required three or four years to bring to perfection, but having no capital to enable him to carry on his business till they should arrive at maturity, he contracted a large debt to Daniel Thwaites, his managing man, for wages, &c., and being unable to pay him, he executed an assignment of the bulbs in his favour. There was no mention of this assignment in the schedule. Mr. Cooke contended that this singular omission arose from a consciousness on the part of the insolvent himself, that he had intended a fraud, and that the assignment was to be ultimately for his own benefit. Mr. Woodroffe replied. Mr. Commissioner Bowen adjourned the case to enable the insolvent to give up the property, and in case he declined doing so, to confer with the chief commissioner as to the adjudication to be given.

MARK LANE, FRIDAY, APRIL 29.—There seems to be a great apathy in the Corn trade this week, and scarcely any business has been transacted to-day; a few samples of English Wheat have been sold at about Monday's quotations, but in free Foreign the trifling sales made have been at declining prices, and at the late rates there are no purchasers of bonded.—Barley, Peas, and Beans, are without alteration in value, but there was some inquiry for these articles in bond, but prices are considered too high.—The Oat trade continues extremely dull, the same prices being demanded.—The trade for Clover-seed is pretty well over for the season.

THE VOYAGES of CAPTAIN COOK. A new and Complete Edition, handsomely printed on super-royal paper, and illustrated with Maps and numerous Wood-cuts. Parts 1 to 7 are now ready, containing Ninety-five Engravings; and the whole will be comprised in about Thirteen Monthly Parts, price Half-a-Crown each.
London: William Smith, 113, Fleet-street; and sold by all Booksellers.

In 8vo, price 7s. 6d., Third Edition, improved, of
THE CULTIVATION of the GRAPE VINE on OPEN WALLS. By CLEMENT HOARE.
"Mr. Hoare has thrown more light on the subject of Vine culture than any British gardener who has written on the subject."—*Gardener's Magazine.*
"One of the best productions upon any horticultural subject which has been published for some years."—*Athenæum.*
London: Longman, Brown, Green, and Longmans.

This day is published, price 3d.,
PUNCH'S GUIDE to the LIONS of LONDON, illustrated with upwards of Eighty Engravings, being No. 42 of PUNCH, OR THE LONDON CHARIVARI.
Also, price 1s. 4*d.*, Part 10; containing 50 pages of letter-press, and numerous Illustrations from Designs by Leech, Meadows, Crowquill, Henning, &c.—Vol. I. may still be had, price 7*s.* 6*d.*, and all back Numbers are always kept on sale.
Office, 13, Wellington-street, Strand.

In one Volume, elegantly bound, gilt edges,
PAXTON'S POCKET BOTANICAL DICTIONARY.—The immense quantity of useful and interesting information condensed in this little volume, relating to the history, culture, and uses of all known Plants, should render it the indispensable pocket companion of every one fond of Plants, or in any way connected with gardening, as a pursuit or amusement. As a book of reference it will be found useful to the profession, and interesting to all classes. It is, in fact, a miniature Botanical Encyclopædia.
London: J. Andrews, 167, New Bond-street; and Orr and Co., Paternoster-row.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s.* 6*d.*
PAXTON'S MAGAZINE OF BOTANY. The Number for May, 1842, contains highly-finished drawings of *Franciscea latifolia, Calceolaria Standishii, Zieria lævigata,* and *Rhododendron Smithii aureum*; likewise Papers on Gardening as a science, with illustrative woodcuts; on Improving Indigenous Plants; Baskets for Orchidaceæ, copiously illustrated with engravings; Floricultural Notices of new and beautiful Plants figured in the chief Botanical Periodicals for March and April, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.
This work comprises, monthly, four admirably-coloured plates, and twenty four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—
1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.
It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.
London: W. S. Orr and Co., Paternoster-row.

LITERARY FUND SOCIETY, for the Protection and Relief of Authors of genius and learning, and their Families, who may be in want or distress. Instituted 1790; incorporated by Royal Charter, 1818.

Wax, grafting . . . . 286 *b*

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.—The First Exhibition will take place on Saturday next, the 14th of May; subjects for Exhibition must be at this Office on Friday, the 13th, or at the Garden before HALF-PAST EIGHT O'CLOCK, A.M., on the 14th. The Gates will be opened at One, p.m. Tickets are issued to Fellows at this Office, price 5*s.* each; or at the Garden in the afternoon of the days of Exhibition at 10*s.* each; but none will be issued without an order from a Fellow of the Society.

The attention of Exhibitors is particularly directed to the following regulations:—

All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition. Exhibitors are requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens on the exhibition tables. The best places will be secured for those who comply with this request. As it is necessary that the judges should proceed to consider the respective merits of the exhibitions by 10 a. m., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past 8 o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the Exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals. All specimens, whether of fruit or flowers, will remain untouched until after 6 o'clock, when they will be delivered into the hands of the Exhibitors, who are most particularly requested not to give away their cut flowers in the tents. Every principal exhibitor of subjects for which medals are specifically offered will be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before 10 o'clock, at which hour the Garden will be cleared of all persons not officially detained there. Exhibitors may re-enter the Garden after 1 o'clock, when they will be required to give up their pass-tickets at the Carter's-yard gate. No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to unhinge. No box with a fixed lid will, on any pretence, be allowed to stand upon the tables. If a box not constructed of the dimensions above given is sent in, it may be placed on the tables, if there is room for it, but it is liable to exclusion.

The Society distributes the following Medals and Rewards; namely,—C. The Certificate, value 10*s.* SB. Silver Banksian Medal, 1*l.* SK. Silver Knightian ditto, 1*l.* 5*s.* LS. Large Silver ditto, 1*l.* 15*s.* SG. Large Silver Gilt ditto, 4*l.* GB. Gold Banksian ditto, 7*l.* GK. Gold Knightian ditto, 10*l.* LG. Large Gold ditto, 20*l.*

The subjects of Exhibition are divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards. To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

CLASS I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—*N.B.* No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—*N.B.* No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals both in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants, GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—*N.B.* Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

CLASS II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, GB, LS, SK.—*N.B.* The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants, LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—*N.B.* Cockscombs, Hydrangeas, and cut flowers, are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—*N.B.* Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

CLASS III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—*N.B.* All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—*N.B.* Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. The Anniversary Meeting will be held in London, at the Society's House, No. 12, Hanover Square, on Monday the 23rd of May, at 12 o'clock precisely. By order of the Council,

JAMES HUDSON, Secretary.

FUCHSIA "VENUS VICTRIX."

PLANTS of this superb FUCHSIA are now being sent out at 21*s.* each, with the usual discount to the Trade, if three or more Plants are taken at once.—For Agents appointed, see *Chronicle* of 30th ult.—Persons enclosing a Post-Office Order for 21*s.* can have a Plant transmitted by post, prepaid.

THOMAS CRIPPS, Tunbridge Wells Nursery.

NEW FUCHSIAS, CALCEOLARIAS, AND SPANISH CHRYSANTHEMUMS.

WILLIAM MAY, in tendering his grateful acknowledgements to his numerous Floricultural Friends for their former favours, is encouraged to announce to them that his descriptive List of SIX NEW HYBRID FUCHSIAS, of distinct character, and of very improved merit to anything yet before the public,—also his six new and superb CALCEOLARIAS, which he will warrant distinct and equal (if not superior) to any yet offered, the whole being perfect in shape, of superb size, and of exquisite colours—and also his fifty new and superior CHRYSANTHEMUMS, from the South of Spain,—is now ready, and will be forwarded, on post-paid application to his Nursery, Leeming Lane, near Bedale, Yorkshire. N.B.—Strong Plants will be ready to send out early in May.

NEW AND SUPERB FUCHSIAS.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the NEW FUCHSIAS sent out by various parties, which they have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they are now ready to be sent out at the rate of 21*s.* per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, May 4th, 1842.

TULIPS.

A COLLECTION of the above-named FLOWERS to be SOLD, containing some very fine and valuable Varieties, either in single Roots or by the Row, as may suit the Purchaser. —Apply to Mr. Macefield, Home's Cottage, New North Road, Hoxton.

EXHIBITION OF TULIPS.

H. GROOM, CLAPHAM RISE (late of Walworth), by appointment, Florist to Her Majesty, respectfully announces that the PRIVATE VIEW of his superb Collection of TULIPS will take place on TUESDAY the 10th of MAY; and that on the 11th and succeeding days they will be open to the Public from 9 o'clock until 5, Sundays excepted. Admittance 1*s.*

TULIPS.—HAMPTON, MIDDLESEX.

MESSRS. LAWRENCE beg to inform their Friends and the Public that their Collection will be in BLOOM for the next THREE WEEKS. Admission, *Gratis.*

J. KEYNES, FLORIST, SALISBURY, begs to state that the following (with all the established Show Flowers of the Season) are now ready for delivery with his usual fine Plants. To all growers, he has no hesitation in confidently recommending them as decided improvements. *The Yellow stands at present unrivalled,* and will be indispensable to a first-rate stand. Should either of the following not prove Show Flowers, they will be deducted from accounts.

Prince of Wales (Dod's), pure yellow, most perfect shape	10*s.* 6*d.*
Twyford Perfection (Young's), puce, edged crimson .	10*s.* 6*d.*
Westbury Rival (Hall's), puce, extra fine form . .	10*s.* 6*d.*
Prince Albert (Adam's) shaded bronze, new colour .	10*s.* 6*d.*

Salisbury, April 30, 1842.

NEWSOME'S PRINCESS ROYAL STRAWBERRY.

W. NEWSOME, BANK-TOP, DEWSBURY, begs to remind his Friends and the Public that he has a quantity of strong well-rooted Plants of the above superb Strawberry, 12 berries from which weighed 16 oz. Their delicious flavour is not to be surpassed; and as this is a good season for planting, an early application is desirable. Mr. Brooke, Druggist, Dewsbury, may be referred to for the weight of the fruit.

Plants, at 5*l.* per 100, may be obtained on application to the Grower; Mr. Henderson, 67, Strand, London; Mr. Girton, Nurseryman, Newark; and J. and T. Backhouse, Nurserymen, York.

BIANCA DAHLIA.

F. AND A. SMITH & Co., beg to apprize their Friends and the Public, that their Dahlia BIANCA not having broken sufficiently well to enable them to meet the demand for plants with satisfaction to all parties, they respectfully decline sending it out until next year.

F. and A. S. & Co., whilst returning thanks to their numerous Patrons, contemplate with the greatest pleasure the further opportunity which will now be offered of *again* establishing, by a *renewed* public competition, the superiority of Bianca over every other white Dahlia; and of thereby refuting the groundless and uncalled-for insinuations which have been made against it from interested and unworthy motives,—unworthy of further notice.

N. B. Their Catalogue, containing an extensive collection of the newest and best Dahlias, of this and the previous seasons, may be had on application. A large quantity of strong plants are now ready to send out, at moderate prices; also may be had, a choice collection of the newest and best Fuchsias and Verbenas, at low prices.—Hackney, London, May 6, 1842.

SPARY'S CONQUEROR OF THE PLAIN DAHLIA.

E. SPARY having fulfilled his engagements up to the present period with those gentlemen in the Trade who favoured him with their commands, for which he begs to tender his thanks; as a limited number of good healthy plants remain on hand, immediate attention will be paid to those who please to favour him with their additional commands.

Hungerford, May 4th, 1842.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,

2d	,,	24	,, ,, ,,
1st	,,	18	,, ,, ,,
2d	,,	36	at the Botanical Gardens, Hull, Sept. 2d;
2d	,,	12	,, ,, ,,
1st	,,	24	at the Horticul. Soc., Scarborough, Sept. 3d;
1st	,,	12	,, ,, ,,
1st	,,	6	,, ,, ,,
1st	,,	48	at the Yorkshire Philosophical Soc., Sep. 9th;
1st	,,	36	,, Botanical Gardens, Sheffield, Sept. 15th;
1st	,,	36	,, Horticultural Soc., Barnsley, Sept. 21st;
1st	,,	24	,, ,, ,,
1st	,,	48	,, Botanical Gardens, Leeds, Sept. 22d;
1st	,,	48	,, Horticultural Society, York, Sep. 24th;
2d	,,	24	,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s.* 6*d.*

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s.* 6*d.*

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet. —Plants 10*s.* 6*d.*

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

James Richardson	Richard Land	John North
John Roper	John Walker	Jas. Lancelot Foste
J. Heseltine	Edward Bearpark	William West
Henry Bellerby	Robert Dempsey	John Robinson.
William Dove		

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant*

CHAPMAN'S NEW SPRING POTATOES.—This excellent new variety, possessing all the qualities of the best Ash-leafed Kidney, but capable of being produced in perfection for table from November till June, is now ready for delivery at One Guinea per bushel, with directions for their culture in the open ground without protection.

"We never yet tasted any forced or retarded Potatoes anything like so good."—Dr. Lindley, in *Gardeners' Chronicle.*

"We can only repeat, that, be they what they may, they are of excellent quality."—Dr. Lindley, in *Gardeners' Chronicle*, Apr. 2.

*** Orders for sample baskets, enclosing 1*s.*, will be attended to; but orders for sets must be prompt—addressed to T. H. Chapman, Brentford-end.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.—WILLIAM WOOD & SON have the honour to announce that they are now sending out their splendid New PETUNIA, Fielder's Magna rosea, at 3*s*. 6*d*. each; and as the orders already received are very numerous, they beg leave respectfully to inform those Friends who are desirous of possessing this magnificent variety, to lose no time in forwarding their applications, as the stock is limited.

May be had in London of Messrs. Warner and Warner, 28, Cornhill; Mr. J. Carter, 238, High Holborn; and at Tunbridge Wells of Mr. Thomas Cripps, or by application at the Nursery, Maresfield.

GUANO MANURE.

W. SKIRVING, SEEDSMAN, QUEEN-SQUARE, LIVERPOOL, begs to announce to Landed Proprietors, and to Farmers and Gardeners, that the price of the genuine Guano has just been fixed by the importers as follows:—viz., 16*l*. per Ton for quantities under five Tons, and 15*l*. per Ton for any larger quantity.

W. S., from his experience with the Guano on various crops last year, and from the appearance of the crops of Grass at present where it was last year applied, can with confidence recommend it as a very good and, at the above price, a cheap Manure, for any garden or field crop. With this conviction, he has accepted an Agency for the Sale of the genuine Guano, and shall be happy to receive orders, which shall be promptly executed, direct from the Importer's Stores.

Terms of payment, ready money; a remittance or reference required.—Liverpool, 9th April, 1842.

JAMES MAY begs to return his sincere thanks to his numerous Friends for the very liberal encouragement he has received for his Pansies, &c. &c. It has been to him a matter of deep regret, that, in consequence of the very unfavourable season of last year, the stock of his new kinds has fallen far short of the demand; but he hopes in the course of next month (May) to complete all orders on hand for them. J. M. avails himself of this opportunity of informing his Friends and the Public, that their liberal patronage has induced him to take more extensive grounds, situated in Marsh Lane, Tottenham, which is three miles nearer to London, where his business will be carried on in future. In consequence of his removal he begs to offer fine plants of about 30 extra fine varieties of Pansies, by name, including most of last year's approved Show varieties, for 21*s*.; fine border varieties, 100 plants in 25 named kinds, for 25*s*., package included; 12 extra fine named Fuchsias, 18*s*.; 24 varities, by name, for 25*s*., package included. A large assortment of Dahlias, including all the approved Show kinds, from 25*s*. to 30*s*. per doz.; all the approved older kinds, 9*s*. to 12*s*. per doz.; fine plants of which are now ready to be sent out.

N.B. Fine plants of that fine blooming creeper, Solanum Jasminoides, which he has proved to be perfectly hardy, 2*s*. 6*d*. per plant.

A remittance or reference is respectfully requested from unknown correspondents: the safest way of remittance is by Post-office orders, payable at the Edmonton Post-office, or General Post-office, London.—Pansy Nursery, Tottenham, April 1842.

NEW PLANTS, &c.

MESSRS. VEITCH & SON beg to offer to the Public the undernamed Plants.

Gloxinia Speciosa, var. Macrophylla Variegata. An imported plant from the Brazils, and of which a figure, &c. may be seen in the Botanical Magazine for April 1842. 2*l*. 12*s*. 6*d*. per plant.

*Begonia Coccinea, beautiful vermilion colour, from Brazil. 21*s*. per plant.

*Cycnoches Maculata, variety, 84*s*.

Stigmaphyllon Aristatum, 42*s*.

*Primula Denticulata (Hardy), from the Himalayas, fine, 10*s*. 6*d*.

Triptilion Spinosum (Hardy Perennial), from Chili, 42*s*.

NEW GERANIUMS.

Fair Maid of Devon (Veitch's). This flower was exhibited at the June exhibition at Chiswick in 1841, and pronounced by the principal Nurserymen and Amateurs to be one of the most splendid Geraniums ever seen. It is of large size and first-rate form, the upper petals beautiful bright crimson, with a distinct white margin round; the under petals light pink, with white centre. Extra fine, 63*s*. per plant.

Rose of Oxton (Swete's), raised by J. B. Swete, Esq., Oxton-house. The colour a fine bright rose, with clear white centre; fine form, abundant bloomer, and compact habit. A really good variety. 21*s*. per plant.

Mulatta (Swete's). A beautiful clouded flower, upper petals being almost black, and the under petals deep crimson. An abundant bloomer, and a striking fancy variety, but the form indifferent. 15*s*. per plant.

*** A notice of the three plants marked * may be seen by reference to Proceedings of the London Horticultural Society's meeting of the 15th of March last, when a medal was awarded them; see *Gardeners' Chronicle*, No. 12, p. 190.

Nursery, Exeter, April 20th, 1842.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, DAHLIAS, FUCHSIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers is now ready for delivery, including Fuchsia, Conspicua arborea, raised by S. R. Prouse, Esq.; it is of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out an expanded bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Plants in May at 10*s*. 6*d*. Also two new and distinct varieties of the Verbena, from Texas—Ne Plus Ultra, a clear bright pink, with a rose-coloured spot surrounding the tube, which is white; a pleasing variety; colours very much resemble those of Phlox Drummondii. Elegans, a pale pink, with a delicate rose-coloured spot surrounding the tube; plants in May, the two, at 10*s*. 6*d*. Likewise Dahlia, Lady Ann Murray, a beautiful mottled white tipped with bright rosy purple, a well-formed flower, with a fine centre, one of the most constant Dahlias grown, and desirable to the most limited grower, 3 feet, 10*s*. 6*d*.

Hans-street, Sloane-street, Chelsea.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE respectfully informs the Nobility, Gentry, and the Trade, that he has a few plants left of that favourite Geranium

LYNE'S CIRCASSIAN,

which has gained for itself, by every Florist who has seen it, a first-rate character. Good strong plants, in 60-sized pots, 42*s*. each.

Lyne's Consort, 21*s*. each.

,, Magnificent, 21*s*. ,,

Lyne's Princess Royal, and Bassett's Glory of the West, (of which W. E. K. possesses the entire stock,) cannot be sent out till about July next, in consequence of the numerous applications for it.

Veitch's Fair Maid of Devon, (just sent out,) 63*s*. each.

Pansy.—Fox's Cornish Gem, 10*s*. 6*d*. each.

Rosa Devoniensis, good strong plants, 7*s*. 6*d*. each.

Auraucaria Imbricata, in 48-sized pots, 6*s*. 6*d*. each.

W. E. R.'s General Spring Catalogue of Geraniums, Dahlias, Calceolarias, Pansies, Herbaceous Plants, &c. (which contains descriptions of the above-named plants,) can be had on prepaid application.

Agents in London: Messrs. Warner, Seedsmen, Cornhill; M.W. Bristow, Knightsbridge; through whom plants of any of the above may be procured.—Plymouth, April 25th, 1842.

ALEX. SMITH, NURSERYMAN, CIRENCESTER, begs to acquaint the Public that he is now selling at very reduced prices his stock of Greenhouse, Hardy, and other Plants. The Greenhouse Plants consist chiefly of the best varieties of Geraniums, Camellias, Heaths, Fuchsias, Cinerarias, &c. &c. Srong Plants of his Beauty of England Pansy, at 5*s*. each.

MESSRS. PROTHEROE & MORRIS will Sell by PUBLIC AUCTION at the Mart, Bartholomew Lane, on THURSDAY, May 12th, 1842, and following day, about 1000 Dahlias, comprising all the leading varieties, first-rate Geraniums, New Fuchsias, Ericas, Verbenas, &c. May be viewed the morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers.

SEED BUSINESS to be DISPOSED OF, principally GARDEN; old-established, with a wide, light Country Connexion; with a good House, Stabling, Coach and Cart House. Low-rented; ill health and old age are the cause of wishing to dispose of the business.—Letters addressed to A. B., Mr. King's, 21, Finsbury-place North, London.

PRODUCTIVE LIFE ASSURANCE SOCIETY and MARITIME FUND empowered by Acts of Parliament. Offices, 29, Moorgate-street, Bank, London.

Board of Directors.

John Blogg, Esq., Guildford-st., Russell-square.
Donald Grassick, Esq., Bedford-place, Kent-road.
Hyam Hyams, Esq., Cornhill.
George Rose Innes, Esq., Billiter-street, City.
J. Linnit, Esq., Argyll-street, Regent-street.
W. T. Smith, Esq., Public Office, Southampton-buildings.

(With power to add to their number.)

Treasurer.—Hyam Hyams, Esq.

Auditors.

Robert Dover, Esq., Cornhill.
Amos Hodgson, Esq., Ordnance Office, Tower.
James Walton, Esq., Grocers' Hall.

Arbitrators.

Charles Compton, Esq.
Peter Ellis, Esq.
John Tidd Pratt, Esq.

Bankers.—The Bank of England.

Physician.—William Brewer, M.D., F.R.S., &c., 21, George-street, Hanover-square.

Surgeon.—David Lewis, Esq., 28, Artillery-place West, Finsbury.

Solicitors.—Messrs. Chatfield, Wingate and Hart, Cornhill.

Actuary.—Francis G. P. Neison, Esq.

Chief Agent for the Maritime Fund.—Thomas Bull, Esq., 91, Minories, London.

This Society is established on the principles of Mutual Life Assurance, with a division of the whole amount of profits among all the assurers, to whom the books of the Society always lie open for inspection. A General Meeting takes place annually, at which is given a detailed account of the business of the Society. No policy stamp duty charged on assurances above the term of ten years.

The Maritime Fund is a department of the Society which affords to captains and mariners the same facilities and advantages of life assurance which residents in England have hitherto enjoyed. Upon this fund, at a comparatively small cost, a member (should he be lost at sea on a particular voyage) will provide an annuity for his wife as long as she lives, in proportion to what he has paid.

Every particular may be known, and Prospectuses and "Observations upon the Maritime Fund" obtained, by applying to Mr. Bull, any of the country agents, or the Secretary, at the offices, 29, Moorgate-street. GEORGE B. SCOTT, Secretary.

HORTICULTURAL IMPROVEMENTS.

AS Spring approaches, the Larvæ of destructive Insects are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe, to the great injury of the young shoots of trees, vines, plants, and every species of vegetation put into motion and growth by the genial influence of the season. I. READ begs to inform Noblemen, Gentlemen, Nurserymen, and practical Gardeners, that he has now a variety of his NEW PATENT HYDRAULIC MACHINES for the purpose of subduing these destructive insects, which make such deadly havoc on all trees and plants (particularly the Peach and Nectarine) at this season of the year. These machines are made of various dimensions, suitable for every purpose of Horticulture, and are worked with such ease, that a lady may enjoy the pleasure of watering her plants and flowers without the least fatigue, and the water may be dispersed in form of a gentle shower or dewfall. The above are so constructed, as to require but two-thirds the labour of any other machines now in use, which the Patentee, from 31 years' practical experience in the science of Horticulture, and 21 years in manufacturing and improving them, can safely warrant.—Likewise FIRE ENGINES made to order, capable of discharging from 20 to 40, 70, or 120 gallons of water per minute, which may be seen and proved at 35, Regent Circus, Piccadilly.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronised their improved Conical Boiler. (For a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l*. 5*s*. and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard.

WANTED, by a gentleman, in a midland county, an active, middle-aged single man, as GARDENER. He must thoroughly understand the growing and fruiting of Pines, Vines, and every description of winter forcing. The extent of the gardens about an acre, and the walks and plantations not extensive. He will have the assistance of one perpetual labourer. Wages 30*l*. per annum, with board and lodging. No one need apply who cannot produce a good character for honesty, sobriety, civility, and a general knowledge of his business, from a gentleman with whom he has lived as head gardener. Apply by letter, post-paid, to W. S., 451, Charing Cross.

WANTS a SITUATION as GARDENER, a respectable, active married man, aged 30. He is a superior Grape-grower, and also understands Pine and early forcing, with the management of a garden in its different branches. Has a seven years' character from the place he is about to leave, on account of the death of his employer. Address A. Z. at No. 2, Adelaide Terrace, Balton Street, Islington.

WANTS a SITUATION as GARDENER in a Nobleman or Gentleman's family, a man 30 years of age, who has a practical knowledge of his profession, and can have an unexceptionable character from the gentleman he has just left, where he lived nearly three years. Apply by letter, post-paid, to A.Z., Messrs. Willmott and Chaundy's Nursery, Lewisham, Kent.

WANTS a SITUATION as GARDENER (a single-handed place), a single young man, who can have a good character from the place he is about to leave. No objection to a foreman's place in a gentleman's garden. Apply to A. B., Mr. R. Henbrey, Jun., Seedsman, Croydon.

WANTS a SITUATION as GARDENER a respectable married man, who perfectly understands his business. Would have no objection to a cow or two; no objection to town or country. Direct C. T., Mr. Owen's, Millfield Place, Newington Green.

WANTS a SITUATION as GARDENER, a Married Man, aged 28, who understands his business in all its branches. Would have no objection to accept a situation in France. Can produce an undeniable character from the Gentleman he has recently left, with whom he lived 5 years. Address A. Z., Post Office, Crouch End, Hornsey, Middlesex.

WANTS a SITUATION as NURSERY FOREMAN, a Married Man, aged 33, of practical experience in the business, as propagator, and the general routine of the Nursery department, and at present conducting an entensive establishment within 100 miles of London, having a general knowledge of the seed business, and compent for the journeys if required. Apply, if by letter, to E. C., Messrs. Warner and Warner's, Seedsmen, &c., Cornhill, London.

TO NOBLEMEN, GENTLEMEN, AND FARMERS.

WANTS a SITUATION, as FARM BAILIFF, in any County in England, a Young Man, a native of Cumberland. The advertiser has been brought up to Farming and Grazing, and is acquainted with most of the modern improvements in agriculture; and would be able to give respectable references, and produce sufficient testimonials as to character and capabilities.—Address A. L., Post-office, Brampton, Cumberland.

WANTS a SITUATION, as BAILIFF, GARDENER and MANAGER, a Respectable Middle-aged Married Man, without encumbrance, who perfectly understands Farming in most parts of the Kingdom; also the System of Gardening, Forcing and Botany; Value and Management of Timber and Growing Plantations; Grounds tastefully laid out; a good Accountant, and a satisfactory character from a Norfolk family of title. The Wife to manage the Dairy and Poultry.—Address H. B., 52, Grosvenor-place, Pimlico.

WANTS a SITUATION as FORESTER, a Young Unmarried Man, who is about to leave his present situation, where he has had the charge for several years, and had considerable experience in the planting and management of Woods. He can produce ample certificates of character and qualifications for such a situation; or he would have no objection to undertake the charge in the Forest Tree department of an extensive Nursery.—Address, Eagle and Henderser, Seedsmen to the Queen, Edinburgh.

TO NURSERY AND SEEDSMEN.

WANTS a SITUATION, as FOREMAN and PROPAGATOR, a Single Man, 36 years of age; is fully competent to take the entire management of the business in every department. The Advertiser possessing a practical knowledge of business generally, would be happy to devote his abilities exclusively for the benefit of his employers, having been similarly engaged the last thre eyears; and can give the most satisfactory references.—Letters directed to W. G., Nursery, Holton Halesworth, Suffolk; Mr. J. Fairburn, Nurseries, Clapham; or Mr. Adams, Brompton Park Nursery, Kensington-road, London, will meet with immediate attention.

WANTS a SITUATION as GARDENER, out of the House, a Young Man, a native of Scotland, about 30 years of age, who perfectly understands his business in all its various branches; can be very highly recommended by the Gentleman he is now leaving, for sobriety, industry, &c. &c., having lived five years in his situation.—Letters addressed to D. G., Post-office, Farringdon, Berks, will be duly attended to.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE is hereby given that the NEXT MEETING of the Society in REGENT-STREET will be on TUESDAY, MAY the 24th, and not on the 17th, as is customary.

The Gardeners' Chronicle.

SATURDAY, MAY 7, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Zoological	8½ P. M.
Wednesday	Medico-Botanical . . .	8 P. M.
Saturday	Royal Botanic	3½ P. M.

IT will be seen from our advertising columns that the first meeting in the Garden of the Horticultural Society takes place next Saturday. We trust the exhibitors will observe that the hour at which the Garden is closed, and that when it is cleared in the morning, *is this year altered;* and THAT NO SUBJECTS OF EXHIBITION WILL BE ADMITTED INTO THE GARDEN LATER THAN HALF-PAST EIGHT O'CLOCK IN THE MORNING.

THE plans of Government for the creation of New Forcing and Kitchen Gardens for her Majesty at Windsor are being carried rapidly into execution. A square piece of excellent loamy land, never before cropped as a garden, and something more than twenty acres in extent, is enclosed; the ground is half levelled and trenched, and the boundary and intersecting walls are already in an advanced state. When completed, there will be nearly 4,000 yards of walling available for training fruit-trees. Along the north side of the garden is to be erected a line of forcing-houses, about 300 yards in length, with a house for the gardener in the middle, and a conservatory on either side. At the back will be placed the pits and smaller forcing places which it is desirable to keep out of sight. In front of the principal line of houses is to be a broad terrace walk, along which the Queen can be driven when her Majesty desires to visit the garden. We understand that Messrs. Jones and Co., of Birmingham, have contracted for the execution of the roofs and sashes of these extensive constructions. As far as we can judge from the present state of the operations, everything seems to have been contrived with skill, and to reflect much credit upon Mr. Ingram, Her Majesty's gardener, to whom the arrangement of the details has, we presume, been confided.

We trust that ere long we may have the gratification of announcing the commencement of a Pleasure-garden at Windsor on the same extensive scale, or, at least, that the grounds of Frogmore-lodge, beautiful in themselves, and now about to be occupied by H.R.H. the Duchess of Kent, may be decorated in a manner worthy of the Queen of England. The grounds at Frogmore have been greatly neglected, and were lately a wilderness of laurels and other evergreens. Mr. Ingram has, however, had the grateful task of restoring them to what they once were; and we must praise the prudence and judgment with which he has carried his orders into execution. Walks have been cleared, thickets removed, and vistas opened; but the original design of the place, improved by the inevitable effects of age upon the trees, has been judiciously preserved. It is to be hoped, however, that a new flower-garden, the formation of which is contemplated in a charming little amphitheatre immediately to the right of the house, will be constructed in room of the old one, which, if it had no other fault (and it has many), must be condemned on account of the clouds of dust with which it is enveloped in consequence of its contiguity to the public road.

Let it not be supposed, that in pressing the necessity of another Royal Pleasure-garden, we undervalue the beauty of the "Slopes," as they are called, which at present form the only pleasure-ground of the Sovereign at Windsor. Their picturesque situation on the steep side of that noble castle would alone render them worthy of the place, even if they were less skilfully decorated than they are. The shade of the graceful trees, the undulations of the walks as they are carried over the brow of the Castle-hill or along the precipitous sides of the escarpment, the sequestered lodge which bears the name of Queen Adelaide, and let us add the mass of rock-work recently constructed, with its grottoes and cascade, and the basins of limpid water, all contribute to render the Slopes a charming retreat: but they are nothing more—they are not a garden. It is impossible to make a garden on the steep sides or the summit of a bleak chalk rock; and we can only regard the Slopes, beautiful as they undoubtedly are in summer, as a Royal Shrubbery.

EVER since the day when what are called Ward's cases were first announced as a new contrivance for the preservation of living plants, one portion of the world has evinced a little insanity upon the subject, ascribing to them attributes quite marvellous; another has been reasonable, applying them to useful purposes; a third has declared them to be unmanageable; a fourth, and larger part, of the gentle public has been simply indifferent, and has cared nothing about the matter. The idea, still entertained by many persons, that plants live in Ward's cases hermetically sealed, with no access to air or water, and therefore no food, and that, nevertheless, they grow and flourish for years under such conditions, is one of those mistakes which well-informed persons, who are unacquainted with the laws of vegetable life, may be excused for falling into. But that gardeners or botanists should draw such conclusions, is, we confess, surprising. That amateurs, unacquainted with the peculiar habits of plants, should have failed in managing those which they have attempted to grow in Ward's cases, might well be; but that cultivators should have met with no success, only shows their want of skill in applying the principles of cultivation to a new class of circumstances. In reality, this contrivance is extremely useful, and easy to manage, if the proper means are taken; but it has been rendered difficult by misconception and mystification. We have, therefore, received with much satisfaction Mr. Ward's own account of his invention and its use*, which, we hope, will at last place the matter in its true light.

Mr. Ward is a surgeon, residing in Wellclose-square, a small open space at the back of the Tower of London, surrounded with houses and smoky manufactories. It is impossible to imagine a place more unpropitious for the formation of a garden, because, although the dryness of the atmosphere might be corrected, it would, under ordinary circumstances, be very difficult to prevent plants being encrusted and stifled with particles of soot. Nevertheless, he tells us that, having been very fond of Botany from his boyhood, he was anxious to procure "an old wall covered with Ferns and Mosses." To obtain this treasure some rock-work was formed, water was made to trickle over it, and plants were procured—but in vain; grow they would not; and the attempt was abandoned in despair. At last, an accident led him to devise the contrivance which bears his name. We quote his words.

"I had buried the chrysalis of a Sphinx in some moist mould contained in a wide-mouthed glass bottle, covered with a lid. In watching the bottle from day to day, I observed that the moisture, which, during the heat of the day, arose from the mould, became condensed on the internal surface of the glass, and returned whence it came; thus keeping the mould always in the same degree of humidity. About a week prior to the final change of the insect, a seedling fern and a grass made their appearance on the surface of the mould. I could not but be struck with the circumstance of one of that very tribe of plants, which I had for years fruitlessly attempted to cultivate, coming up *sponte suâ* in such a situation, and asked myself seriously what were the conditions necessary for its growth? To this the answer was—firstly, an atmosphere free from soot (this I well knew from previous experience); secondly, light; thirdly, heat; fourthly, moisture; and lastly, change of air. It was quite evident that the plants could obtain light and heat as well in the bottle as out of it; and that the lid, which retained the moisture, likewise excluded the soot. The only remaining condition to be fulfilled was the change of air."

The change of air required no contrivance; for it was impossible to prevent it without hermetically sealing the apparatus; and to omit such an entire closing was to secure as much variation as the plants required. Those which sprang up in the bottle accordingly continued to grow, without any attention, for four years, when they accidentally died. From this time forward, Mr. Ward had no difficulty in growing plants in Wellclose-square, in spite of dust and soot, and other impurities. By constructing boxes, or other closed-up places, with the laps of the glass puttied, and the doors to fit tight, air enough for the plants was found to be admitted, while all the substances floating in the atmosphere were excluded. It was only necessary to expose the cases fully to the light. The following is the account he gives of one of his little gardens:—

"In order to have a gay assemblage of flowers, I filled a case about three feet by one with the following plants, viz., Primula sinensis, P. nivalis, Scilla sibirica, Cyclamen Coüm, Ornithogalum Sternbergii, Gagea lutea, Ganymedes pulchellus, and three or four varieties of Crocus, interspersed with little patches of Lycopodium denticulatum. This case was placed, about the end of February, outside a window with a southern aspect. It is not, I believe, possible to see these plants to such advantage in any ordinary garden. Here, undisturbed either by wind or rain, their flowers are developed in the greatest luxuriance; and most of them continue for two or three months."

To the question whether plants confined in such places require water, Mr. Ward answers thus—

"This depends not only upon the nature of the plants, but upon the season of their growth. Almost all Ferns, if enclosed in small cases where the water cannot escape, will continue to flourish for years; and I believe that a century might elapse without any fresh water being required. Cactuses, and most succulent plants, would be equally independent. In larger houses, where the surfaces are very varied, the water will drain from the upper parts, and fresh supplies will occasionally be wanted. If we wish our plants to grow with greater or less luxuriance, we have of course, at all times, the power to give or withhold water. Numerous plants require to be well supplied with water up to and during the period of inflorescence, and when the flowering is over to be kept nearly dry. This is easily effected by removing the cover, and allowing the moisture to evaporate by exposure of the case for a short time to the sun. It is desirable that there should be an opening in the bottom of the cases for the purpose of draining off the superfluous moisture, and likewise of giving us the opportunity of washing the mould with lime water should slugs make their appearance, which sometimes occurs. With respect to the mould, it is perhaps best to select that in which the plants which are to be the subject of experiment ordinarily grow; but this is not a matter of so much moment as is generally imagined. It is a very common impression that great knowledge of Botany is required before any successful attempts at the cultivation of plants in closed cases can be made; now, it must be obvious, from all that has been said, that whether the plant be grown in a closed case or in the open air, the natural conditions must be filled to ensure success. Again, many complain that the enclosed plants frequently become mouldy; this arises either from excess of moisture or deficiency of light, or a combination of both causes, producing diminished vital action, or else from the natural decay of plants."

For the present, we refer our readers to Mr. Ward's work for full information concerning the purposes to which his contrivance may be applied, one of the most important of which is the effectual means it affords of bringing plants alive from very distant countries. Hereafter, we shall have some observations of our own to make upon several matters connected with the subject.

ENTOMOLOGY.—No. XXIX.

ON THE USE OF NETTING, AS A PROTECTION OF FRUIT AGAINST INSECTS.

IT is a generally-received opinion that insects are to be driven away by offensive odours; and this may, to a certain extent, be correct; but if we look into the economy of a vast number of species, it will be found that, like some of the higher orders of animals, they delight and thrive in filth: indeed, this renders them of the greatest service to man, as, by speedily assisting in the decomposition of animal and vegetable substances, they in a very short time remove, by their united labours, such nuisances, and thus, in fact, are nature's scavengers. Not a bone, a dead carcase, a cabbage, or turnip, but as soon as the vital principle is extinct, becomes the habitation of a variety of Beetles and Flies, which immediately lay their eggs, and increase so rapidly, that the muscles and skin of an animal and the pulpy tissue of a vegetable are soon consumed. These tribes of insects, the analogues of Swine and Ducks in their habits, are not, we should say, very easily disgusted by any preparations employed with a view to drive them away from our trees and plants; although it is not intended to deny that there are insects cleanly, and even fastidious in their tastes, and whose olfactory nerves may be offended by disagreeable odours; but such are not the great pests in our gardens.

The idea, therefore, that it is necessary to immerse netting, intended to cover fruit-trees, in gas-tar, to render its use effectual, appears to be doubtful; and its efficacy in protecting the fruit from the depredations of Wasps and Flies (many of which, the Blue-bottle Flies for instance, revel in putrid carcases,) may, I think, be traced to a very different cause.

It was a fact well known to the Egyptian fishermen in the time of Herodotus, that by covering themselves, when in bed, with their casting-nets, they would be protected when asleep from the swarms of Gnats which infest the marshes everywhere, but especially in southern latitudes, in the summer months, and will sting, as it is termed, even through woollen clothes. This curious circumstance was, however, quite forgotten until recently, when it was ably discussed, by Mr. W. B. Spence, in the Transactions of the Entomological Society*. It appears, by placing a net over the window of a room having no thorough or cross light, or draft, that Flies and even Wasps are deterred from passing through; and it has been tried so often, that there cannot be any doubt upon the subject. If, however, a mirror be placed opposite to the open and netted window so as to reflect the light, or if a door or another window be open in the same room, the netting loses its obstructive properties—the charm is broken, and the flies and insects are no longer deterred from passing through.

Now I apprehend that a net, being placed over a fruit-tree upon a wall, acts the same as a net stretched across an open window: there is no cross light or draft in the wall, and, consequently, the Flies will not pass through the meshes. Of this, however, the Gardener may easily satisfy himself; for, as I am informed, it is a generally-admitted opinion, that a net spread over a wall is a very efficient mode of preserving the fruit from the attacks of many insects. He has only to cover a *standard* tree with a net, and if that keep out the Flies and Wasps in the same way, then, indeed, we must admit that there are other causes in operation; but if they pass through, it will be strong presumptive evidence of the soundness of the principle we now maintain. It would also be desirable to try netting dipped in gas-tar, as well as some which has not been steeped; and by carefully prosecuting the experiments, and communicating them to the public, useful and interesting information would be offered to the practical man as well as the philosopher.

The net employed for excluding House-flies in Italy is made of white or light-coloured threads, the meshes being at least an inch in diameter; or if nails be placed an inch apart down both sides of a window, and threads be stretched across horizontally, it will be equally efficacious in keeping out the Flies, which are deterred by some unknown cause from passing the Rubicon. Nets of red and yellow worsted, the meshes of which were from three-quarters to an inch in diameter, have been stretched across a window in this country, surrounded by Sweet-scented Clematis, Honeysuckles, &c., which, of course, attracted numerous Flies, and amongst them the Blue-bottle: and they were all excluded by this simple and agreeable screen. A net of fine packthread was afterwards substituted, having meshes one inch and a quarter square, which proved equally efficacious as regarded the Flies; and "though *Wasps* occasionally came through, the number was very much diminished*."—*Ruricola.*

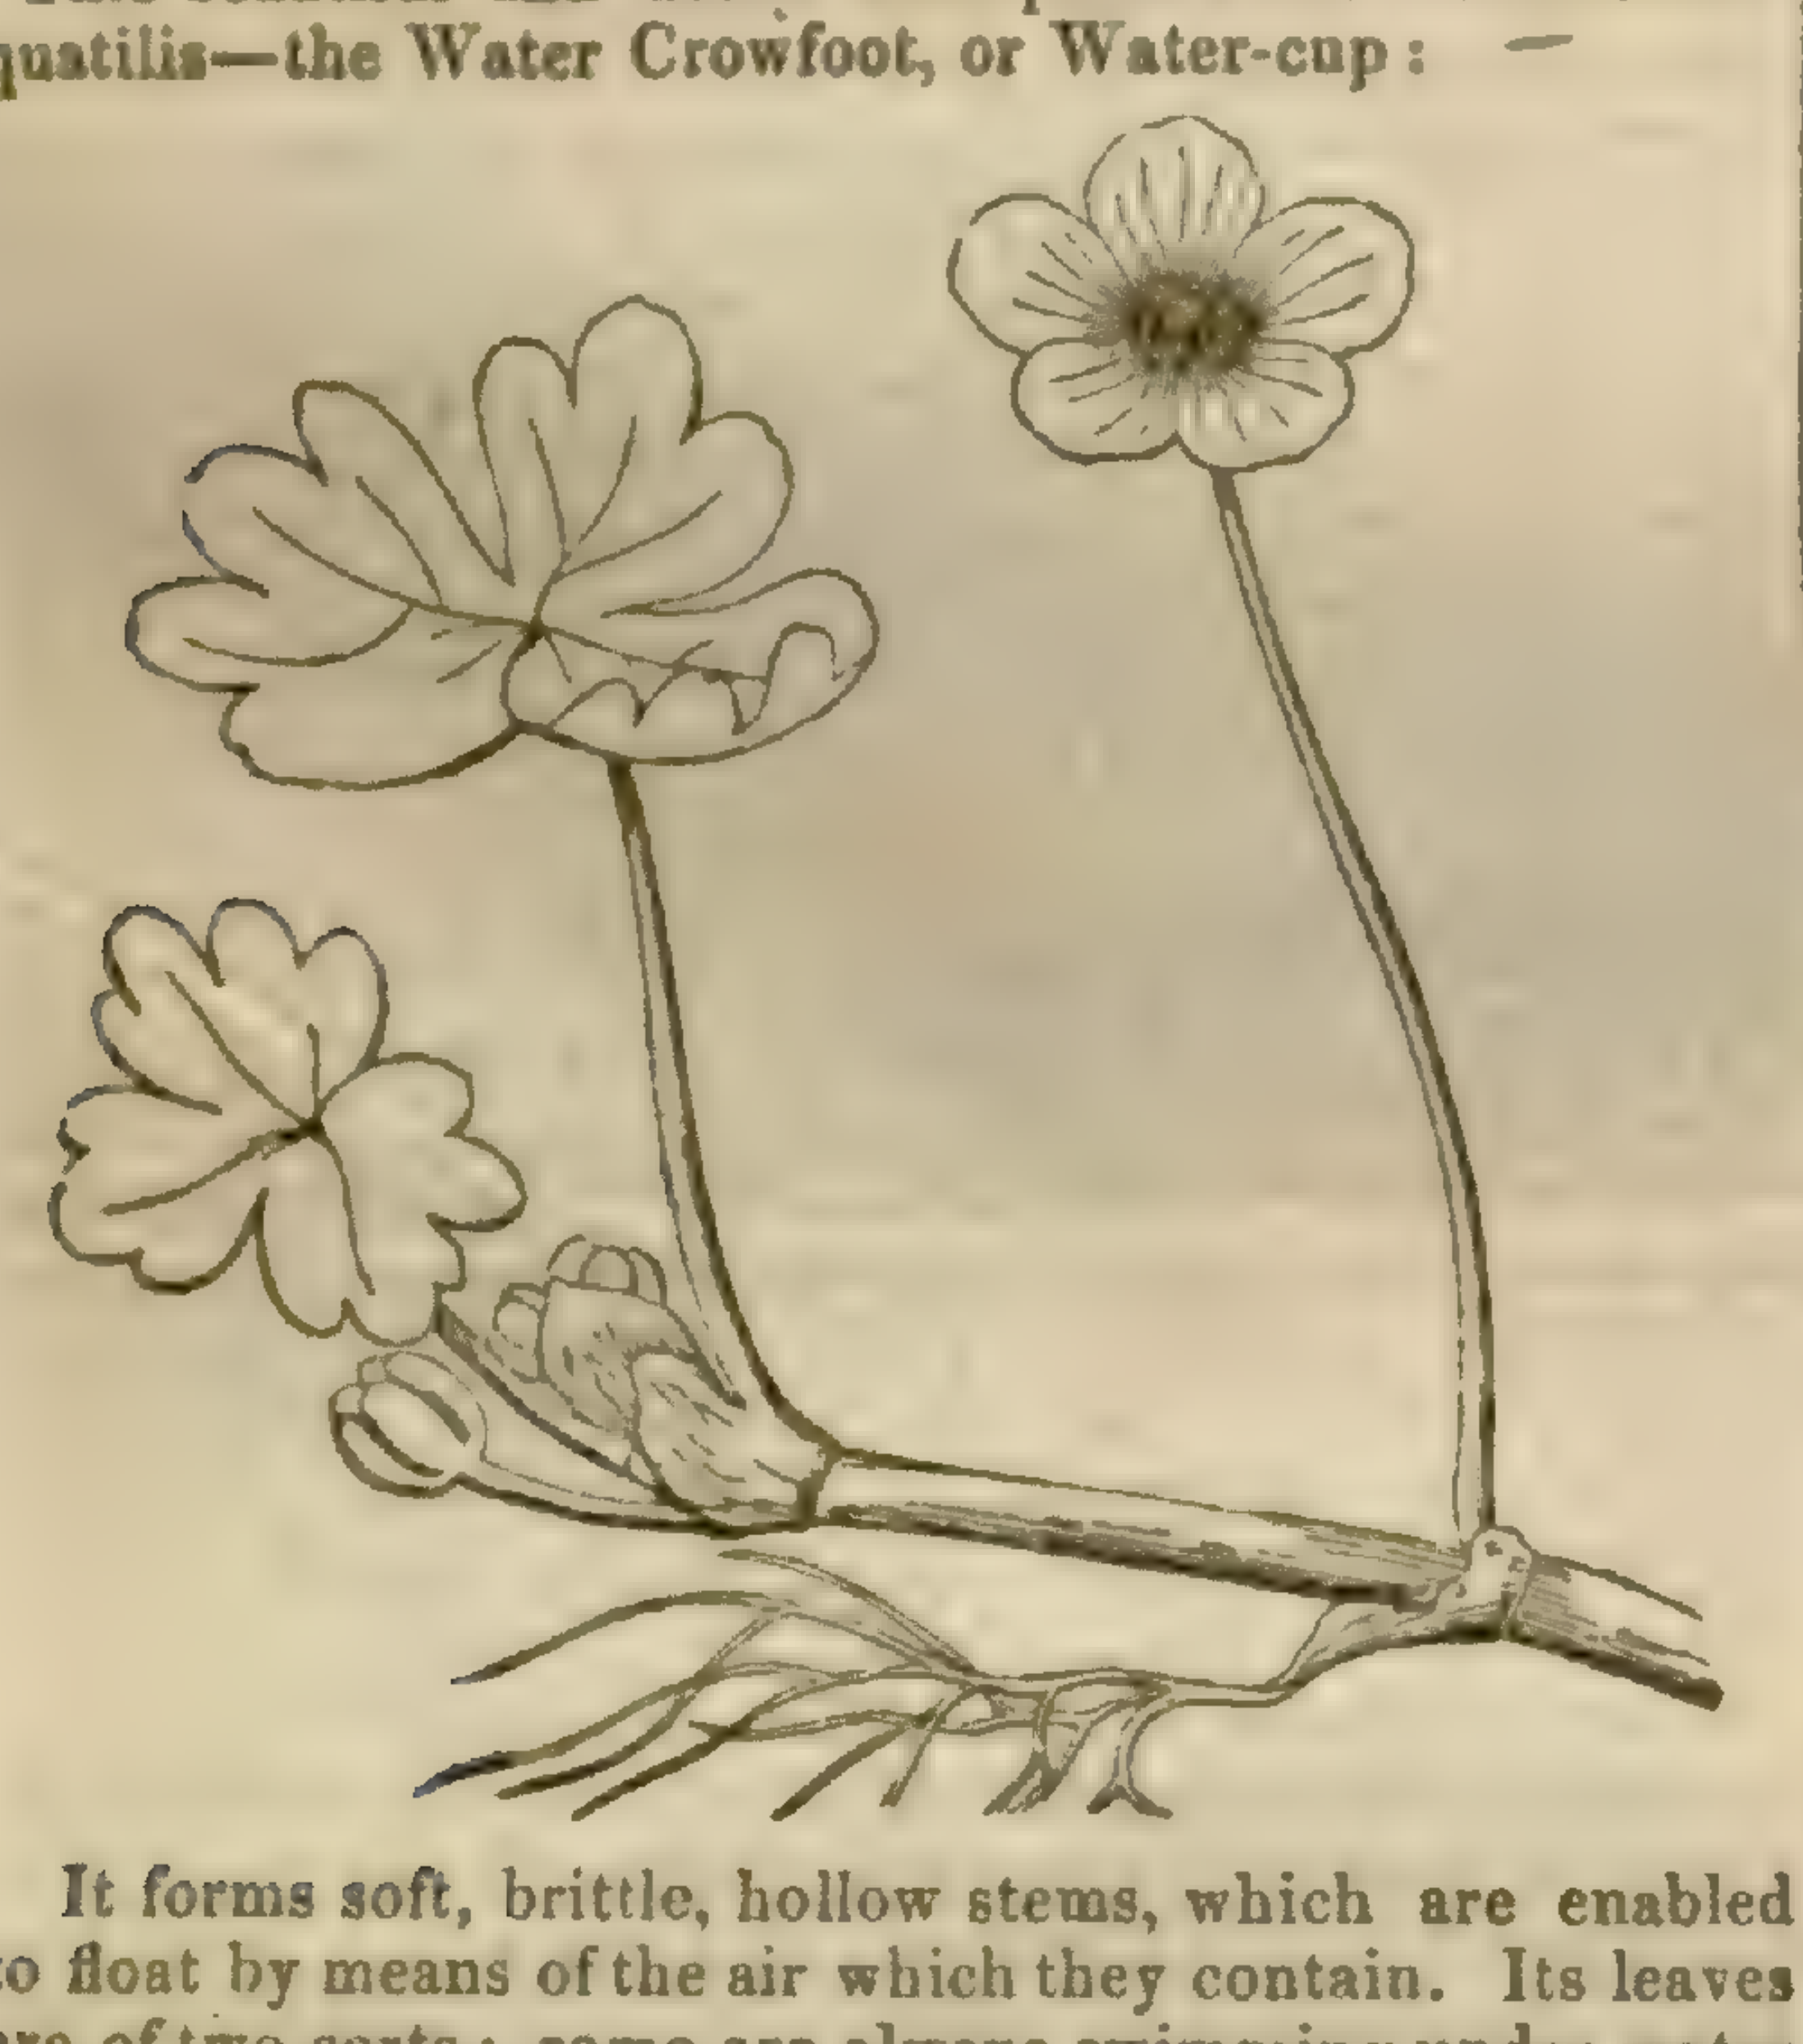
FAMILIAR BOTANY.—No. VI.

> What sweet delight a quiet life affords!
> Sweet flowery place, I first did learn of thee!
> Ah! if I were my own, your dear resorts
> I would not change with prince's stately courts.
> *W. Drummond.*

The Water-cup.—It is in such flowery places as the poet thus alludes to that this charming wild flower floats in its livery of green and silver. The recesses of a gentle river, or the quiet of a country pond, where the water is not much disturbed, are its usual haunts. There it forms a carpet of lucid foliage, succeeded by myriads of cups of dazzling white. It appears with the warm days of April, and is gone by the middle of summer. In that short space of time, however, it has performed more real service to man than perhaps could be effected by the trees that overshadow it. Its long succulent roots branch in all directions among the water that it floats upon, sucking up greedily all the impurities it may contain; by them the water is deprived of the power of emitting unwholesome exhalations, and swamps are deprived of their unhealthy character so long as such flowers are growing in them. And thus the means which nature takes to beautify the stagnant waters act as an effectual counterpoise to their insalubrious quality. It is said, that in Florida and Carolina, marshes speedily become uninhabitable where flowers of a similar nature are destroyed, and pestilent exhalations can be no longer consumed by them.

This beautiful and useful little plant is the **Ranunculus aquatilis**—the Water Crowfoot, or Water-cup:—



It forms soft, brittle, hollow stems, which are enabled to float by means of the air which they contain. Its leaves are of two sorts: some are always swimming under water and divided into numberless green threads; others, which float on the surface, are thin, flat, bright green, and are only divided into three lobes, each of which has some shallow round teeth. These two sorts of leaves are so unlike each other that one would almost fancy them to be of an entirely different nature. The fact, however, is, that the leaves of the Water-cup, when formed under water, consist of nothing but veins; while those which float on the surface have their veins covered with a firm green pulp, which forms a sort of web, that holds them together.

Here again is a manifestation of admirable design. If the swimming leaves had a web, they could neither adapt themselves conveniently to the motion of the water, nor feed so fast upon the impurities it contains; for they too help the plant to absorb its food, and the great surface they present to the water gives them a voracious appetite. On the other hand, if the floating leaves had no web, but their veins were exposed to the air, they would neither float nor even exist: for the action of the air upon them would soon dry up and destroy their tender parts. But nature provides them with a firm, dry coating, which guards them from injury, and moreover enables them to breathe with freedom. Truly may theirs be called the "breath of life;" for the air which is continually exhaled by them in the day-time is among the purest that is known, although prepared by these little plants from the most impure and unwholesome materials.

If we look at their flowers we shall find them much like those of the Butter-cup, only that they are white. Each blossom stands erect on its graceful stalk. Its calyx consists of 5 sepals, which guard the tender petals, and then drop off as soon as their office is fulfilled. The 5 petals are roundish, and form a snow-white cup; each of them has a little honey-pore near its base. A great many tiny stamens form an inner ring of the flower, and in the centre of all is a cushion of minute green points, which are so many young fruits, or carpels, as they say, in the inside of each of which there is a seed.

Let him who reads these little sketches of plants now remark, what it is of no little importance to know, that the numerous stamens of the Water-cup grow directly from the ring below the carpels, and not from the calyx, which falls off, as we have seen, and leaves them behind. By this sign we shall know that it is in itself poisonous, although it destroys the poisons that surround it. If the leaves are chewed, or the ripe fruit, they will produce a burning sensation, and cause some inflammation. It is, in truth, a near relation of the Black Hellebore and Aconite, two deadly plants, whose virulence has been recognised from all antiquity. If the stamens did grow on the calyx, it would not be poisonous—a very curious circumstance, which I must explain on another occasion.—*R. E.*

BROCCOLI.

In making a selection of different kinds of Broccoli capable of producing a constant supply from October to May, the following directions should be attended to; viz., to save the seed from the truest and most perfectly-formed heads, and not indiscriminately, as is frequently done. There is, perhaps, no vegetable more subject to degenerate than Broccoli; therefore the quality and hardiness of each sort, as well as the time when it will be fit for use, will depend on the care and attention bestowed upon saving the seeds; this should be done in the following way:—

When that kind from which it is intended to save seeds has formed its heads, carefully select the best, for size, colour, texture, and hardiness. If in the autumn or the early part of winter, carefully protect the plants from severe frost and wet; about the middle of April, when the heads have started, cut out a part of the centre of each, and only allow one kind to be saved for seed at the same time; observing also, that the greater the number of plants saved together, the better and more genuine the seed will be: the great object, therefore, when saving seeds of Broccoli, is always to have as large a quantity as possible. If there should be a single head much superior to the others, which you wish to save seed from, the best way will be to cover it with gauze, to protect it from the bees and other insects. I once saved seed from some most perfect heads of white Broccoli, but when the plants raised from it produced their heads, many were quite worthless, although no other Broccoli had been allowed to flower near this parent, which, being a single plant, must have attracted the bees from a considerable distance, where no doubt some other Broccoli had been in flower at the same time.

Broccoli should be sown at different times from the beginning of May to the middle of June, according to the season, or the time when a supply is most wanted. As much depends on the dryness of the weather after planting, the severity of the winter, the soil, &c.; it may be worth while here to briefly state their effects. *First*, a dry season after planting is almost sure to cause the greater part of the Early Cape to button, or form heads, while the plants are small, and particularly if it should be dry weather before planting, and the plants were allowed to remain too long in the seed-bed; this will happen to seed of the very best kinds, and can only be avoided in a dry season by sowing in the following manner: about the beginning of June select a piece of good open ground, manure and dig it level, and roll the surface firm and even, then sow the seeds in shallow drills, two feet apart, dropping three or four seeds at intervals of two feet in the rows, and when the plants are large enough thin them out singly, and treat them like transplanted ones. By this means they never receive a check, and generally (if the soil is rich) attain a large size; this only applies to the Cape kinds. *Secondly*, the severity of the winter will sometimes destroy the whole crop, more especially of the white kinds, which are by far the tenderest; in such cases the most simple means of preserving them is either to lay the plants down, or take them up, before severe weather, and place them in a cool cellar or other suitable place for winter use; laying down, however, is by far the best way (for private family use, but not for the market, as the heads become one-sided and will not bunch,) and is done by taking up the plants carefully about the beginning of November, and laying them in with the heads sloping to the north, only a few inches above the surface; then if very severe weather should occur in winter, some old Pea-haulm, or any long dry litter, should be thrown over them.

In planting for winter and spring use, it is necessary, if the winter proves mild, to sow the seeds early in May, and afterwards to plant out on very rich soil, with plenty of room. The Broccoli will then (if they survive) produce large and fine heads; while, on the contrary, if the winter should be severe, they should be sown later by a fortnight, and planted on rather poor ground, but stiff, allowing them plenty of room to grow; by this means they become hardier and stunted, and less liable to be killed by cold; but the heads will never be so large as those planted on richer soil. This course applies only to those which have to stand through the winter, and particularly to the white kinds.

The following selection of sorts, if treated according to the above directions, will give a constant supply from October to May, and may be divided into three divisions, viz. Purples, Sulphurs, and Whites.

FIRST DIVISION—PURPLE OR GREEN BROCCOLI.

1. *Early Purple Cape.*—Syn. Grange's Early Cape, Purple Silesian, Purple Sicilian, Blue Cape, Violet Nain Hâtif of the French. This is the earliest of all Purple Broccoli, and comes into use during September and October. The heads are close and compact, of a purplish-green colour, and rather large. This should be sown at three different seasons, viz., the first and third week in May and second week in June.

2. *Green Cape.*—Syn. Hardy Cape, Late Cape, Autumnal Cape, Improved Cape, Maher's Hardy Cape. This sort nearly resembles the preceding. The heads are greenish, rather larger and later, and come into use in October and November. It is worth growing as a succession to the preceding one. This may be sown about the middle of May and the middle of June.

3. *Green Close-headed.*—Syn. Late Green, Late Hardy Green, Dwarf Roman, Siberian, Late Green Siberian. This is a dwarf kind, with the heads quite exposed, very hardy, rather large, and of a greenish colour. It continues to produce close, compact heads from November to the end of February. Sow about the second or third week in May.

4. *Sprouting.*—Syn. Italian Sprouting, Grange's Early Purple Sprouting, Early Branching, Lisbon, Autumn Sprouting, North's Early Purple. This is a very useful kind, producing a great quantity of small, deep purple heads from the crown and axil of the upper leaves. It is very hardy, and in use from November to April, or even May, if sown at different periods, from May to the end of June.

5. *Danish, or Late Green.*—Syn. Dwarf Danish, Late Danish. This is a very hardy and late kind, with the heads exposed, and of a greenish colour, large, and produced in April and May. It is the hardiest and best suited for standing severe winters. Sow about the second or third week in May.

6.—*Late Dwarf Purple.*—Syn. Dwarf Danish Purple, Cockscomb, Dwarf Swedish, Late Purple, Italian Purple, Dwarf Hardy Siberian, Dwarf Close-headed Purple. This is the latest of all the purple kinds, and very dwarf. The heads are rather small and conical, of a deep purple colour, and very hardy, coming into use in May. Sow this and the next about the same time as the preceding.

7. *Dwarf Brown.*—Syn. Late Danish, Late Dantzic, Late Brown, Lewisham Brown. A very hardy sort, with rather large exposed heads, of a yellowish brown colour. In perfection from March to May.

These kinds will produce a succession of the Purple Broccoli from September to May, and are to be obtained at the seed-shops.

SECOND DIVISION—SULPHUR.

8. *Portsmouth.*—Syn. Cream-coloured, Belvidere, Southampton, Maher's New Dwarf. The largest and most handsome of all the coloured Broccoli, with the centre leaves partially covering the heads, which are of a buff colour. It is in use during March and April, and is very hardy. Sow about the second or third week in May.

9. *Sulphur.*—Syn. Brimstone, Late Brimstone, Edinburgh Sulphur, Fine Late Sulphur. Another hardy sort, with large, compact, rather conical heads, of a yellowish colour, stained with purple. In use during April and May. This may be sown at the same time as the preceding.

THIRD DIVISION—WHITE.

10. *Grange's Early Cauliflower Broccoli.*—Syn. Cup-leaved, Hopwood's Early White, Early Dwarf, White, Invisible White, Bath White, Italian White, Marshall's Early White, Blanc d'Italie of the French. This is a very fine kind when true, but very subject to degenerate. The heads are large, close and white, and are well defended by the leaves. It is in use from the end of September to Christmas, if the weather proves mild, and is the earliest of all the white kinds. This and the next should be sown at three different seasons, viz., about the first and third weeks in May and the second week in June.

11. *Early White.*—Syn. Neathouse, Devonshire White, Autumn White. This differs from the preceding in the heads being smaller and much later; its season being from November to February, if the weather prove mild or they be protected during severe weather. This is the kind grown for market.

12. *Knight's Protecting.*—This is the hardiest and largest of all the White kinds, when well grown, but very subject to sport and degenerate. Its season is from March to the beginning of May, if planted at different times. Sow about the third week in May.

13. *Spring White.*—Syn. Close-leaved White, Cauliflower Broccoli, Neapolitan White, Naples White, Large Late White, New Dwarf Late White. The leaves of this kind grow very erect, and the head has much the appearance of a Cabbage, being so enclosed as to be invisible when fit to cut. It has a moderate-sized compact head, of a beautiful white colour, which is in perfection during the months of April and May; not so hardy as the preceding, but very desirable for late use. Sow at the same time as the preceding.

There are other good kinds, but they come into use at the same time as some of those enumerated; but two or three seasons may be made from one sowing by selecting the larger plants at each time of planting out.—*G. Gordon.*

AMATEUR'S GARDEN.—No. XIX.

As amateurs are now supposed to be making their arrangements for planting out half-hardy ornamental plants, it may be proper to remind them that a great deal of their beauty depends upon the proper arrangement of the plants with reference to the different colours of their flowers. One person will plant his borders and beds with the same kinds and in the same favourable situation as another, yet the colours will appear much more deep and brilliant, and the general effect more pleasing, in the one case than in the other. This is because the subject, in the one instance, has been studied, and the colours matched; while, on the other, they have been planted at random, or the harmony of colours has not been properly understood. This is one point in gardening in which amateurs, and particularly ladies, might succeed much better than the generality of gardeners, because they are supposed to have a more extensive knowledge of the arts, such as painting and preparing of colours, besides the taste which they are constantly displaying in the selection of the different parts of their dresses. Those who are not conversant with this subject cannot do better than study a leading article at page 291 (1841). I may mention a few instances of particular plants which, being placed near one another, produce a fine effect. The new blue annual, Brachycome iberidifolia, matches well with the orange Erysimum Perofskianum; Salvia patens (blue) may be placed next any of the scarlet Verbenas; Verbena pulchella alba suits Phlox Drummondi, but being of a pure white, it will also suit any of the former. The flowers of the scarlet Pelargonium harmonise finely with its own green leaves, or with the green of other shrubs which it may be near; the same may be said of Dahlias, although it is better to arrange the colours of the flowers at the same time, because if two yellows, for example, are placed together, one of which is good and the other dingy, the beauty of the former will be affected.

---

* *Vide* Observations by the Rev. E. Stanley, in Trans. Ent. Soc. vol. ii. p. 46.

Almost all agree that beds, or clumps of plants of the same kind, have a much finer effect than a mixture of single plants; and, therefore, where room can be spared, this plan should be adopted. This system, however, looks well, even with rough-growing things, in shrubberies, providing the mass is not sown in a regular figure.

Many plants suffer much when they are first planted out, particularly if the weather is dry, from the operation not being carefully performed. This should be done in the following manner: If the ground is hard or stiff, it must be well dug and broken up. The plants must be turned carefully out of their pots and planted, without disturbing their rootlets; at the same time making a bason round each capable of holding a considerable quantity of water. Fill this three or four times with water; and if done in the afternoon or evening, the soil may be levelled round the plants early the next day; if the weather is not very dry, nothing more will be required. Of course the best time to plant is when the weather is showery and the ground moist; but this is not always the case; and even then, unless the weather is likely to continue wet, it is much better to water well when planting.—*R. F.*

HOME CORRESPONDENCE.

Cause of Shrivelling in Grapes.—Observing that you gave a place to my letter, signed "No Conjuror," in your last Journal, and encouraged by your leading article, which I believe referred to it, I have now no further reason for concealment. You are probably aware of the fame this place once had for Grapes, and until a stimulus was given to their growth under the directions of Mr. Crawshay, it had no competitors in the county. I am not competent to say whether they have improved or declined under my management, although they had certainly begun to retrograde before I knew them; and it is not to be wondered at, when their age (planted in 1780) and the soil in which they grow are considered. When I came here, I found a very inferior crop in a forcing-house, with the leaves of the Vines flagging on hot days, which evidently betokened that all was not right beneath. The other houses were little better; I represented to my employer that I could not do myself any credit nor expect to give him satisfaction unless I had both new Vines and fresh borders; but as there is no loam upon the estates, nor for several miles round, he did not approve of my suggestion, and as there had hitherto been only partial failures, he attributed it to the roots having reached the springs. Accordingly, during the winter, I examined them, and found that the border, to the depth of two feet, was composed of the soil I mentioned (p. 269); the subsoil was dry enough, being principally sand and marl; and whenever I found a stump of a root that had the least life in it, I removed the soil with a fork or pointed stick; but sometimes, after preserving a root for a yard or two, I found it decayed, and entirely separated from the stem, having preserved its freshness (perhaps for years) without any communication between them. It was not until I arrived within four or five feet of the front of the house that I found roots in any number, and then they were quite black, and without the smallest fibre. I traced them a little nearer home, but being anxious to have some fruit from the Vines, I was afraid to go further. After making a bed for the roots, of the surface soil of the border, some road-scrapings, a little lime-rubbish, leaf-dung, and parings from a Heath, I raised the roots near the surface, covering them up with the same mixture. I likewise placed mould a foot higher up the stems, hoping they would send out fresh roots; but, with one or two exceptions, none had vigour enough to do so; and not answering my expectations, I have been gradually extirpating them and planting others. A few of the old ones, which give me satisfaction, still remain; one of them is a large plant of the Gibraltar or Red Hamburgh, occupying three double lights, and producing about 120 bunches a-year. Everybody is aware that last season was very unpropitious for ripening late crops; and a gentleman, celebrated for growing fine Grapes, told me that "all the Black Hamburghs would be red ones." Mine, however, were all black, which I attribute entirely to the surface-roots which were produced from the stem. On the subject of shanking I confess myself much at fault. I have two Aleppo Vines in one house—the one planted inside, the other out; both are very prolific, and always ripened their fruit well until the two last seasons; when, just after they had set their fruit, and were about the size of small Peas, I found the footstalks of two-thirds of the berries were dead. I saw a whole house near London going off in the same way; it was, I believe, attributed to mismanagement; but I am unconscious of any neglect in my case, and I account for it thus: the house has a south-easterly aspect, and is shaded by some trees until eight or nine o'clock; consequently the sun breaks upon it in full force before the dew on the berries is evaporated, and, trickling down the stalks, it lodges in a little concave bason, where the pedicels enter the berry; and as the house is glazed with green glass full of foci, I think they were really scalded; they dropped off and looked exactly as if they had been immersed in hot water. The leaves of the Vines were not touched; therefore it was not from want of sap to supply the evaporation. This season they again look very promising.—*John Murdoch, Cley Hall.* [The disease here mentioned by Mr. Murdoch must not be confounded with shrivelling. We cannot admit what are called the foci of the glass to have any connexion with it.]

Neapolitan Peaches.—In the year 1838 I was at Naples, and frequently tasted Peaches of a large size, and apparently treated in a peculiar manner to increase their magnitude. The fruit seemed to have been pierced with some sharp instrument, by which the kernel and stone were so wounded that their growth was stopped, and in some instances the opening made by the perforation had grown up: in others it had remained partly open, and had evidently been frequented by earwigs and other similar insects. Can you give any account of this practice, and has it ever been introduced into England? I may be mistaken in my observation; but the fruit certainly bore the appearance of having been subjected to the above treatment.—*R. J. B.* [We know nothing of this practice; does any one among our correspondents?]

The Service Tree.—I have seen in the markets in Italy a fruit like a large Service, but not tasting quite so sharp; more like a Medlar, and of a dark brown like that fruit. I saw the tree growing this year on the road-side between Sienna and Radicofani. The leaf is a good deal like the Mountain-ash, and the fruit pearl-shaped, yellow, and light scarlet; and looks as if it was made of wax, with a very sweet and powerful scent. The Italians call it Sorbo (service). Is it grown in England! The seeds are like a broad apple-seed. I send a sketch of the leaf and fruit, which gets quite brown and soft when ripe. What is it?—[It is nothing but the fruit of the Service-tree (Pyrus doméstica). Soil and situation often cause a trifling difference in the appearance of the fruit.]

New Ribes.—Mr. Low informs me that he has sent you a specimen of a hybrid Ribes, which I raised in 1837 while at Hatfield, in Hertfordshire. He tells me it is very distinct in its inflorescence, and, judging from specimens sent to me, I have no doubt that it will soon become a favourite addition to the shrubbery. Of all the hybrids I have seen, this certainly unites the properties of both parents in the greatest degree, both in foliage and in flowers. When only a few months old, I predicted this; when writing on cross-breeding in "Loudon's Gardener's Magazine" for June 1837, I mentioned this incidentally in the following words:—"I have obtained a cross from Ribes sanguineum, by the pollen of R. aureum (var. præcox of the nurseries), and though the plants are not yet in a condition to prove the identity of the cross, I have yet every reason to believe it a real one. The parents being previously in a high state of cultivation, I anticipate an enlargement in the inflorescence, with a fine tint of pale orange colour, and an improvement in the foliage of the offspring." The orange tint I anticipated is conspicuous only in the inside of the flower, and, as you must have seen from the specimen sent you, contrasts beautifully with the bright scarlet outside. The Hon. and Rev. W. Herbert, to whom I gave a plant of it, pronounced it, at first sight, to be a promising seedling. By using this again as a parent, I have great hopes of improving, or rather originating, a new race of Ribes; and I recommend to those who are fond of this pursuit to follow out the suggestion.—*D. Beaton, Shrubland Park.*

New Tropæolum.—Having observed in one of the late Numbers of the *Gardeners' Chronicle* a notice of a new Tropæolum, which is stated to have been grown by Mr. Kelland, of Jersey, I beg to say that it was grown and bloomed by me, from whom Mr. Kelland procured it. The plants taken over to England by him have been, I understand, so much injured in the carriage as to be quite unfit for exhibition; and I propose, therefore, having still two plants in my possession, to exhibit one at the May Show of the Horticultural Society. I have been informed, since the insertion of the notice before mentioned, that the tubers in Mr. Low's possession (having since shown bloom) turn out to be different from mine, and an inferior variety. I obtained the tubers from Mr. Bridges as stated, but they were found among the mountains near Curico, in Chili.—*Fred. Coventry.* [This is probably the plant alluded to by Mr. Bridges in the last No. of the "London Journal of Botany." "Among the species from the Province of Colchagua, you will find a most beautiful Tropæolum with yellow flowers, which I consider new. Tubers of it are among my bulbs and seeds. I have called it T. edule, because the roots are eaten either roasted or boiled, in times of scarcity, by the poor natives of the Province of Colchagua, who call it 'Papas Cudas.' I shall endeavour, next year, to transmit home tubers of Tropæolum azureum of Miers; a most charming plant, which few persons have ever seen. I once found it producing its lovely blue flowers on the summit of a mountain called 'La Campana de Quillota,' nearly 4,000 feet above the level of the sea, and nowhere, save on this mountain, did I see it, during my rambles in Chili."

Salvia patens.—Your correspondent from Stockton-on-Tees seems to question the probability of the Salvia patens surviving in the open ground during the winter. I left a plant out last season by way of experiment unprotected, except with a little fine sand put on the surface. Early in April it began to shoot out, and it promises to make the finest plant in my stock this season. — *A., Beaumaris.*

Yellow-berried Ivy.—What is the yellow-berried Ivy which grows on some ruin at Rome? There is a proof that it was known to the Romans, for there is a marble in mosaic, in which a wreath of the Ivy with the yellow fruit is figured. Is it generally known in England? I have a plant growing luxuriantly; the leaves appear to be somewhat different from the common kind.—*Totty.*—[It is a mere variety of the common Ivy, found wild in Italy, but very rare in English gardens.]

Pruning Forest-trees.—The professed object of all our forest-tree pruners is "to aid nature in the performance of her work;" their aim is also to produce the greatest results in the shortest possible time, how much soever they may differ in the modes they adopt to bring about the wished-for end; and it will readily be allowed that some of these modes, though put forward with much confidence in their efficacy, have been anything but judicious—some even positively injurious. Mr. Billington tells us his system "is the true one;" and I have no doubt he believes it to be so. But he further says, that almost all writers on the subject, as well as *Quercus*, "confuse it with mutilating (query, is not all pruning mutilation in some degree?) lopping, and snagging." Now here I must beg to assure Mr. B. that I never did so confuse his "system," and have given the reason in former pages of your Paper. My impression is, that the principal feature in Mr. B.'s "system" is termed foreshortening. Now it will not be denied that increase of timber in a growing tree is the result of reciprocity between the root and branches (or head) —and my opinion is, that in whatever degree the balance of that reciprocity is interrupted, the professed object (viz. increase of stem) is precisely in that degree defeated. This is the first general principle, on which all my reasoning upon the subject would turn. If Mr. Billington's tables or his practice demonstrate the contrary, all I can say is, that to me it is a "great marvel." I consider that to deprive a tree of any material part of its head will assuredly have the effect of retarding instead of accelerating its increase of stem. There is within one mile of me a large common covered with Oaks; most of them have now good-sized heads; they are of great age, and have been pollarded many times, but it is now put a stop to; and an old man told me the last pollarding took place about 40 years ago, yet most of these trees have stems only fit for a gate-post. Had they never been beheaded, they would probably have been giants of their kind. I call this only the extreme result of extreme pruning, and the difference between that and general forest-pruning is only a question of degree. I quite agree with Mr. Billington that altitude and consequent climate relatively affect all trees as well as Larch and Scotch Fir; so will soil, which frequently varies with altitude as well as climate; and in all planting operations, to ensure success and future profit, much care and judgment are necessary in adapting the kinds of trees to their future localities; but how far or in what degree the successful result is to be accelerated by any system of pruning, I have yet to learn — further than by giving "direction" to young trees by the removal of a "rival leader." I still disapprove of every "system" I have seen—Mr. Billington's I have not seen. All I have said refers to forest or plantation pruning, with the view of increasing more rapidly the growth of timber. Other circumstances may render pruning in some degree necessary, but that need not be now discussed.—*Quercus.*

Disease in Silver Firs.—Enclosed I send a specimen of the way in which my Silver Firs have been attacked. The plague (for I can call it nothing else) begins about the bottom of the top shoot and spreads rapidly downwards, invariably killing the tree. I should feel extremely obliged by your informing me what course I had better pursue; I have several beautiful young trees which I would fain preserve, but know not how. One of them, 25 feet high, was apparently quite free from the bug, or whatever it is, a fortnight ago: it is now covered with it from top to bottom, and the leading shoot is already, I fear, dead.—*J. N. V., Dundee.* [The plague here alluded to is the Eriosoma Láricis, described by Sir Oswald Mosley at p. 328 of our Paper for 1841. It is, we fear, impossible by any known means to arrest its attacks effectually. The best course to take would be to wash the branches, as soon as they are infected, with oil, or a mixture of potash and lime.

The possibility of procuring fresh Potatoes, planted in the open air, in the months of March and April.—Having been for a long period a friend to Agriculture, and especially to that part connected with the cultivation of Potatoes, I three years ago for the first time thought of planting them in autumn or summer, in order to be able to procure them fresh in spring. My first trials, however, proved unsuccessful; but I last year repeated the experiment on two different spots—Oberliederbach and Harreshausen. In the former place I planted common Potatoes in marl, on the 26th July; in the latter on the 1st August, in sandy ground. In both cases the leaves appeared very soon above the ground; the Potatoes had been planted 9 inches deep, and 1½ foot distant from each other, and came into flower in the last week of October, after having received the usual routine of cultivation. When the first nights of frost appeared, care was taken to cut off the leaves 6 inches above the ground, and to cover the remaining stems well with leaves, or with straw and soil. On the 10th of March in the following spring the first fresh Potatoes were taken out of the ground, and were found in both places where they had been planted in excellent and eatable condition.—*George Lewis Schott, Franc-*

fort on the Maine, 29th March, 1842.—[Those who are interested in the question that has been raised respecting Chapman's Potato will do well to read this communication.]

Asparagus.—My attention having been called to the treatment of Asparagus plants by your remarks of last week, I would suggest to you the following facts which I have frequently had occasion to notice. There are two methods of treating Asparagus-beds,—one, and that more frequently in use in the country, is to leave *from the first* the weak shoots, which some gardeners say encourage the growth of other shoots without distressing the plant, the shoot left being so weak. These shoots are to be found in the strongest and best Asparagus-beds, and if cut, would not be considered worth dressing for a gentleman's table. The other practice, and that more frequently in use in the neighbourhood of London and large towns, is to cut everything away that appears, stout and weak shoots, until a certain day, and then leave off and never cut a stick afterwards. I think it likely the two modes may have originated from the localities of the Asparagus-beds, the weak shoots not being worthy to bring to a gentleman's table in the country who has his own garden, whereas in London and other large cities a sale can be obtained for all qualities. One system, however, must be better than the other. Your remarks would lead me to think the cutting all away for a short time the best, taking care to stop in time to leave the plants strong, but your opinion on this point would set all doubt at rest, and be of great service to numbers, as well as myself, where such opposite practice so generally exists.—*W. D.* [No doubt it is better to cut all away, so long as the cutting goes on.]

Cats and Hedgehogs.—I observe in your last *Chronicle* (p. 287) that Mr. Waterton has his doubts as to whether cats will attack hedgehogs: I can assure him they will do so, having myself been an eye-witness of the fact. I was one morning surprised to see my cat standing at the mouth of a drain, with her tail swelled out to an enormous size, and the hair on the ridge of her back set up like porcupine's quills; on going to ascertain the cause I observed one of these animals in the drain, which was not of sufficient dimensions to allow the cat to follow it. Although I do not suppose that a cat would really be able to kill a hedgehog, still, from the length of time which intervened before she could be induced to leave the spot, it is evident that a great animosity exists between the two animals, and that a *good* cat is not afraid of encountering such a bristly antagonist.—*R. A.*

Dislodging of Ants.—I was last season annoyed by these little insects getting under my propagating glasses, and so disturbing the soil that there was no chance of the cuttings rooting. After various schemes were tried, I watered them with lime water, and was no more troubled with ants. Early this spring, a friend informed me that they were destroying his forced strawberries; I mentioned the above fact, and recommended lime water for watering and syringing the plants, but that if the fruit was too far advanced to admit of this, he might then scatter powdered quicklime along his shelves. He wrote to me shortly afterwards, stating that the ants seemed to have such a dislike to the lime, that they had entirely left his strawberries. Those who may have occasion to try the experiment with forced fruit had better not syringe it with lime water when it is approaching to maturity; for even if the water is allowed to stand until quite clear, yet, from the small quantity of lime contained in it, and its power of attracting carbonic acid from the atmosphere, a small pellicle of chalk would sometimes be formed on the fruit, and would mar its otherwise brilliant appearance.—*Robert Fish, Putteridge Bury.*

FOREIGN CORRESPONDENCE.

Royal Horticultural Society of Paris.—The spring exhibition of this society took place on Friday and Saturday last in the Galerie du Midi of the Palace of the Luxembourg. The weather being extremely fine, the place was crowded to suffocation by the cultivators and admirers of horticultural science, among whom were many of the nobility, including several members of the Royal Family. There was the usual assortment of exotic and indigenous plants, forced vegetables, conserved fruits, &c.; instruments, machines, and ornaments subservient to garden purposes. Of the plants and flowers, there was little either beautiful or new to those accustomed to the splendid exhibitions at Chiswick. In judging, however, allowance ought to be made for the confined salle where the exhibitions take place, in which, by the continual walking and shuffling, everything soon becomes covered with dust, loses its freshness, and is consequently seen to disadvantage. Among those plants worthy of notice, was a well-grown collection of Cacti, including a magnificent specimen of the Cereus senilis; Mammillariæ and Echinocacti in great variety and in fine condition; a Cactus Opuntia, the lobe of which weighed about seven pounds, and a Cereus monstrosus weighing thirty pounds. Of Camellias there was but a small collection, among which the Thé jaune, the Thé belle allemande, and the Triomphe du Luxembourg, seemed to be the favourites. The Hyacinths were good, though not remarkable for rarity. Rhododendrons were largely displayed, but neither these nor the Palm tribe are worthy of particular notice. Mediterranean Heaths were in small number, but select. The stall of forced and preserved fruits and vegetables seemed to be a great point of attraction; severe were the scrambles to approach it, and "lingering the looks behind" of the fair gourmandes, when "Passez, mesdames, s'il vous plait," sounded in their ears. The Melons, Cucumbers, and Strawberries, in pots—Cauliflowers, Asparagus, and Lettuces, as well as the forced Carrots and Potatoes, were deservedly admired; and the conserved Apples, Pears, &c., of last September, from the gardens of the Duke d'Aumale, seemed as if they had been gathered the day previously. In the artistical department, were some beautiful specimens of flower-painting and bouquets of artificial flowers. A very elegant weather-proof garden chair attracted much attention; it is made of malleable iron, lackered to any colour, and cushioned in the bottom and back; and is so made, that by means of a spring the back may be folded down on the bottom, the latter sinking a little by the same action; so that in wet weather it presents a sloping surface, and may be left in the garden with perfect safety. A most luxurious sofa, with a canopy, on the same principles, was exhibited. A collection of decorative flower-pots in fine red earthenware, in the shape of urns, vases, pieces of Gothic architecture, &c., from the elegance of their forms and elaboration of the workmanship, attracted considerable notice; they are intended principally for drooping plants, as an ornament in conservatories during summer soirées, and to which coloured lamps may be attached with great effect. The general meeting of the society was held on Sunday, which was presided by M. Hericart de Thury, the ordinary president, in the absence of the Minister of Agriculture and Commerce, when various reports were read and prizes awarded. The successful fructification of the Vanilla by M. Neumann, of the Jardin des Plantes, was favourably noticed and to which much importance is attached in a city where perfumery forms a staple article of commerce. The prizes or "mentions honorables" were bestowed on the following:—To M. Vivet, for a Clianthus puníceus; M. Ratier, for an Erica mediterránea; to M. Souchet, for a Dahlia; and M. Halligon, for a Salvia splendens (being for plants flowered at the greatest distance from their natural time); to M. Uterhart, for a collection of flowering plants; M. Paillet, for a collection of Rhododendrons; to M. Roblin and M. Berger, for a collection of Roses; to M. Chauvière and M. Uterbart, for new plants introduced into France (Pimelea spectábilis and Andrómeda floribunda); to M. Tripet-Leblanc, for liliaceous plants; to M. Malot and M. Jamin, for table fruits; to M. Gontier, for forced fruits; to MM. Daverne and Moreau, for forced vegetables; to M. Halligon (amateur), for Sálvia coccínea nova; to MM. Duvoir, Leblanc, Gervais, and Guyard, for instruments; to Mlle. Delaporte-Bessin, for a painting of flowers. — *J. H., April* 19.—[We have a letter on this subject from our usual Paris correspondent, to which we shall advert next week.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 2.—Anniversary. At this meeting the Duke of Devonshire, Mr. Edgar, and Dr. Henderson, were severally re-elected President, Treasurer, and Secretary, for the ensuing year; and the Earl of Ilchester, Sir W. J. Hooker, and Mr. Barchard, were added to the Council. In the report of the auditors the income of the Society was stated to be 1119*l.* 17*s.* 8*d.* more than the expenditure; and a reduction of the Society's debt, to the extent of 1047*l.* 12*s.* 8*d.*, within the year was announced.

May 3.—Sir O. Mosley, Bart., in the chair. R. Boyd, J. C. M'Mullan, J. Villebois, and B. N. Williams, Esqrs., were elected fellows. A splendid collection of plants was exhibited by Mrs. Lawrence, amongst which were handsome specimens of Epiphyllum hybridum, Erica aristata major, E. pinifólia, well grown plants of Chorozema Dicksoni and Cýtisus Phillipensis, with a bright crimson seedling Cinerária. A Knightian medal was awarded for the four latter. From Mr. Dean, gr. to J. Bateman, Esq., F.H.S., some cut flowers of Orchidaceous plants, including Epidendrum Stamfordianum, whose delicious fragrance and graceful habit ought to obtain it a place in every collection; Læ'lia cinnabarina, from Brazil, of a bright vermilion colour; Cattleya Skínneri, a rare and beautiful species; and a very fine spike of Cyrtochilum maculatum, the flowers of which were of a deeper colour and nearly twice the size of those generally exhibited. For the three former a Knightian medal was given. From W. H. Story, Esq., a collection of seedling Ericas, raised from E. echiiflora, with exceedingly well-flowered plants of Erica aristata major, E. múndula, and E. campanulata; the last a rare and beautiful variety, with yellow flowers and a peculiarly slender habit. For the three last-named a Knightian medal was also awarded. From Mr. Atlee, gr. to H. Beaufoy, Esq., a collection of greenhouse plants, containing a good specimen of the delicate Erica mundula, and remarkably fine ones of Borónia pinnata and B. serrulata, for which a Banksian medal was given. From F. Coventry, Esq., of Jersey, a seedling Calceolaria, and a perfectly new species of Tropæ'olum, with larger flowers than the greenhouse kinds now cultivated; these are of a dark yellow colour, and fimbriated. This plant unites a peculiarly delicate habit of its own with the excellent one of Tropæ'olum tricolorum. A Banksian medal was awarded for it. From C. B. Warner, Esq. a collection of Orchidaceous plants, containing fine specimens of the rare Broughtònia sanguínea, Zygopétalum rostratum, with its singular long beaked flowers, and Epidendrum variegatum, a beautiful species, and rarely seen in such perfection as the plant now exhibited. For the latter a certificate was awarded. From Mr. Standish, a seedling Calceolária, named C. Standishii, of a beautiful deep yellow, spotted and streaked with reddish brown, and a new Sálvia from the North of India; the blossoms when first expanded are of a delicate lavender colour, but afterwards change to a dark blue: it possesses much the habit of a Lupine, and is likely to prove a valuable addition to our herbaceous plants. A certificate was given for it. From Mr. Stanley, gr. to H. Berens, Esq., some excellent seedling Calceolárias, and a fine plant of Goódia lotifólia, for which a certificate was awarded. From Messrs. Lucombe and Pince, a new and handsome Leptospermum, from Swan River, with pink flowers, which it produces very freely: A certificate was awarded for it. From Mr. Graves, plants of Epidendrum inversum and Oncídium flexuosum, a beautiful species, producing a large drooping panicle of bright yellow flowers. For this also a certificate was awarded. From Mr. Beck, three well-grown Calceolarias, in his newly-invented slate boxes: the luxuriant growth of these plants was sufficient proof that this kind of material suits them as well as the porous burnt pots in general use. From Mr. Veitch, a collection of plants; those most worthy of notice were—the rare Oncídium ramosum, and cut flowers of a greenhouse plant called Stigmatophyllon aristatum. From Mr. J. A. Henderson, an excellent collection of Cinerarias, chiefly seedlings; the colours of some were extremely brilliant, and entirely different from those generally known. A certificate was awarded for them. From Mr. Ivery were also a collection of Cinerarias, and a finely spotted variety of Mimulus. From Mr. Henderson, gr. to Sir G. Beaumont, Bart., some seedling Pelargoniums. From Messrs. Lane and Sons, an excellent collection of forced Roses; amongst which we particularly noticed the following. *Bourbons*: Thérésita, Bouquet de Flore, Coquette de Montmorency, Clementine Duval, De Neuilly, Emilie Courtier, Armosa, Cerise; *Teas*: Theoboldine, Niphites (yellow), Moyrá, Fulgorie, fine dark red; *Perpetuals*: Calliope, William Jesse, Madame Laffay; *Chinas*: Triomphante, Capitaine Parry, Paris, Belle de St. Cyr, and Marjolin. With these was a pretty box of Heartsease, containing some excellent flowers. For the Roses a certificate was awarded. From Mr. Henchman there was also a collection of Heartsease. From Mr. Alex. Scott, gr. to Sir G Staunton, a fine cluster of the fruit of Musa Cavendishii, weighing upwards of 40 lbs.; for this a Banksian medal was awarded. From Mr. C. Macgregor, gr. to H. Villebois, Esq., a handsome Melon, weighing 1 lb. 15 oz. From Lord Beerhaven were some fine Shaddocks and Oranges. From the Garden of the Society, a large collection of Orchidaceous and other plants; amongst them were an exceedingly pretty new species of Barkeria, from Guatemala, with delicate lilac and purple flowers, called by the Spanish Americans Flor d'Isabel, and used by the Guatemalese to decorate their altars and temples; a fine specimen of Oncidium luridum guttatum; Odontoglossum læve, a new but not particularly handsome species; Bossiæa dísticha, and Indigófera sylvática, two very good greenhouse plants, and a pretty collection of Cinerárias.

May 5.—Mr. Solly's second lecture was delivered to-day. On this occasion he entered into a consideration of the composition of vegetable matter, and stated that it consists almost wholly of the four elements, Oxygen, Hydrogen, Carbon, and Nitrogen. These were successively considered, together with their properties, and the compounds they form. *Oxygen* was shown to be a most important part of the air we breathe, and to be the element by means of which objects are enabled to burn. *Carbon*, which exists in so many different forms, comprising the diamond on the one hand and charcoal on the other, was the next subject of examination. Its preparation by charring wood, and its strong affinity for oxygen, were pointed out, but it was shown that it cannot combine with oxygen till it is heated; it then forms carbonic acid gas, the great material upon which plants depend for their food. It is found experimentally that carbonic acid is formed when vegetable matter is burnt in a close vessel; hence oxygen and carbon must have been present in the vegetable matter. *Hydrogen* is a gas forming one of the constituents of water, oxygen being the other. Experiments were adduced in proof of this. Water was formed and decomposed. It was shown that, when dry vegetable matter is burnt, water is formed; therefore, hydrogen and oxygen must be present in the vegetable matter. The subject of *Nitrogen* was deferred till the next lecture. Nothing could be better than the manner in which these matters were treated. The experiments in illustration were well selected, and conducted with great skill; and the increasing number of visitors shows the deep interest they take in the lectures.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 27.—P. Pusey, Esq., M.P., in the chair. Twenty-six gentlemen were elected members. Mr. W. Were, 44, Botolph-lane, who for 30 years has been engaged in the butter trade, communicated the following suggestions for improving the qualities of fresh and salt butter:—"Solidity and firmness are of more consequence than is generally allowed; the nearer the butter can be made of the consistency of wax, the longer it will keep its flavour; as it is not so easily acted upon by the air, it will retain less salt, and being divested more effectually of the butter-milk, will be less disposed to acidity. To accomplish this, rather more fine table salt should be put to the cream than is generally used after churning, because a part will be left with the butter-milk; or strong clean brine should be mixed with the cream or butter; the hand to be used in the making as little as possible (the earlier the butter is made and the cooler the dairy the better—the latter should be washed out with salt and water the first and last thing every day). The hand relaxes the texture of the butter; it might by practice be avoided altogether, by using wooden pats for putting it into casks, or making it into shape for sale, which will press out the whey by beating. These pats must be always kept in a tub of fresh cold water, which will prevent the adhering of the butter, and keep them cool. The quantity of salt or brine required will in some degree depend on the season of the year, the distance to be sent, and time to be kept. Brine is preferable to salt, as the butter is smoother and better flavoured. If salt be used, it may be in the proportion of half an ounce, mixed with two drachms of fine saltpetre, and two drachms of fine yellow dry Jamaica sugar, to every pound of butter. If the butter be made up in lumps for the market, every lump should be wrapped round with calico soaked in brine; if the latter be weak and watery, it may be injurious. If the butter be put into a firkin or half-firkin, the cask should be made of white oak, ash, sycamore, or beech (the whiter the wood and hoops the better), well seasoned by scalding out several times with hot brine; it should be made water-tight, with head and bottom grooved. [illegible] should be allowed for soakage. If the butter is very choice, a salt cloth should be wrapped around it. This can be kept in its place by a hoop, which can be removed as the cask fills; in either case the cloths can be returned or sold. Many use cloth instead of paper in sending out their butter. Much observation, attention, and arrangement is required to see and judge what improvement can be effected in butter; comparative statements from different dairies at different times—the temperament of the milk and cream in the different stages—the situation and state of the dairy—the quantity and quality of cream in different localities, under different management—the effects of various sorts of salt, brine, sugar, honey, or saltpetre mixed with the milk, the cream, or the butter—the effect of mixing different milks together—the effect of heat and acid applied in churning—the best sort of colouring—the effect of dry, wet, or shady pasture, also of regular exercise for the cows—if any, and what effect as to production of cream in proportion to the milk given by the cows, if feeding on corn or grain, or by adding meal in the water for drink." The wooden pats recommended by Mr. Were, to be used instead of the hands, in making butter, are those made by Mr. Allsop, and consist of a thin spatula (a foot long by three inches broad), and a solid spoon-shaped implement (a few inches longer), with longitudinal grooves on its flat inner surface, for dabbing, pressing, and crimping the butter. Mr. Burke adverted to the importance of selection of the proper kind of salt adapted to each kind of butter and cheese; attributing the superiority of the Dutch to their care in this particular. He also stated that in many parts of Holland, brine was added, not to the butter itself, but to the cream from which it was to be obtained; and that he believed honey to be preferable to sugar as an addition for improving its quality.—At a meeting of the house committee it was resolved, that Mr. Dean should be requested to propose plans and estimates for the construction of a museum for the Society at their residence in Hanover-square.

LINNEAN SOCIETY.

May 4*th*.—The Bishop of Norwich in the Chair. Capt. Jones, M.P., was elected a Fellow. John Hankey, John Miers, and Alfred White, Esqrs., were elected auditors for the ensuing anniversary meeting. Lieut. Rudston Reed exhibited a large shell brought from Raiata, in the Society Islands. This shell was remarkable for having retained for several years between its layers a considerable quantity of water, which on being exposed to the cold during the last winter became frozen, expanded, broke the shell, and thus escaped. Mr. Hankey exhibited recent specimens of Fritillaria meleagris, which he had gathered at Finchley. The Rev. Mr. Johns exhibited a living specimen, in full fruit, of Jungermannia reptans, and also dried specimens of numerous species of the family Jungermanniaceæ. His Grace the Duke of Northumberland sent for exhibition the ripe fruit and female plant, in flower, of the Dióspyros edulis, which had been grown in the stove at Sion. The continuation of Dr. Frederick Hamilton's commentary on the Hortus malabaricus was read. The remarks were confined to members of the Cucurbitaceous order. Several of the cultivated species and varieties of India, which are much changed in character, were identified, and their synonymy pointed out. The author thought Jussieu in error in having placed this order so distant from Campanulaceæ, and showed the relation of these orders through Lobeliaceæ. The President announced his intention of giving two soirées to the Fellows of the Society, on the last Friday in May and the last Friday in June.

WEST LONDON GARDENERS' ASSOCIATION.

Mr. Parker read a paper on Pelargoniums. He stated that where strong plants are required to flower the following season, the cuttings should be taken off in March, and at a time when the plants need thinning. The soil used for them should consist of equal portions of turfy loam and leaf mould, with a small quantity of sand; inserting the cuttings simply in small 60-sized pots, and placing them in a frame, with a gentle heat. In about four weeks' time, when the cuttings are rooted, they may be removed into a cold frame, admitting plenty of air as the weather permits, and as they grow topping them at the fourth joint, to produce lateral shoots. In the beginning of May they may be taken from the frame, and placed in an open situation on boards or slates, re-potting them into 48-sized pots, and some of the stronger into 32s. Place an oyster-shell at the bottom of each pot, and put some rough pieces of turfy loam upon it; thus the plant is shifted more readily with the ball of earth entire. The compost, at this stage of their growth, should be two barrowfuls of turfy loam, half do. of peat earth, half do. two-years-old cow-dung, and half a peck of silver sand, the whole chopped up with the spade, and by no means sifted. When the lateral shoots have grown three or four joints, they should be again stopped, and while pliable tied down, so as to form the plants. When these are expected to flower in May, they should not be stopped later than the second week in November; the leaves should then be thinned out, so that the air may circulate freely amongst the shoots. Several sorts, which do not require stopping, will not flower before those which were stopped in November; of this kind are Nymph, Sylph, Foster's Matilda, and Alicia superba. When plants are required to flower in June or July, they should be stopped in January, and re-potted into a larger-sized pot in February, in the following compost: theee barrowfuls of well-enriched turfy loam, half do. of peat earth, half do. of two-years-old cowdung, and one peck of silver sand. The temperature of the house should be kept at 45°, so as to induce them to root freely, for they will not flower well unless the pots are well filled with roots. A fortnight after they have been re-potted, the temperature may be allowed to fall to 42°, and the flues should be damped two or three times during the night, to keep a moist atmosphere—taking care that plenty of air be admitted whenever the weather will permit. As the plants progress, it will be requisite to tie each shoot to a separate stake. In March they should again be examined, and all weak lateral shoots taken off. In April, the fires may be discontinued, and the plants may be syringed overhead twice a week during fine weather, when the house is closed for the night. After continuing this treatment for a month, if the green fly should make its appearance, it will be necessary to fumigate them with tobacco; this should be done when the plants are dry, and the following day they should be well syringed. When the flowers are beginning to expand, a thin shading of canvass should be put on the outside of the house, taking care that the plants never flag for want of water. The blooming season over, the plants should be placed in an open situation for a fortnight, until the wood is hard; they may then be headed down, and when the young shoots have grown about an inch, nearly all the soil should be shaken from the roots. In re-potting them, the size of the pots must be regulated by that of the plants, and must be as small as they can conveniently be put into. The winter treatment must be as before directed.—Mr. Shearer was of opinion that currents of air materially conduced to the health of the Pelargonium; probably by causing motion in the leaves, which accelerated the flow of sap, and also had a tendency to harden the tissue, as is seen in trees in exposed situations; and he thought also that the admission of fresh air as often as possible would prevent a lodgement of moisture on the leaves, which is so particularly injurious to these plants during the cloudy days of winter.—Mr. Caie said that Mr. Parker had noticed two important facts connected with the growth of the Pelargonium: first, the confinement of the roots whilst flowering; secondly, that currents of air have a capacity for moisture at a season of the year when the sun's rays are comparatively powerless: and he thought, that without a knowledge of these facts, neither such flowers nor fruit could be procured from plants not indigenous to our island as might be obtained if these facts were fully understood. Hence the necessity of draining and planting near the surface in certain situations, and likewise the admission of cold air into greenhouses, which, upon entering the house, became heated, and, its capacity for moisture increasing, it naturally extracted that from the leaves of the plants.

COUNTRY SHOWS.

Birmingham and Midland Floral and Horticultural Society, April 28.—The first exhibition of this society was held in the Town-hall, Birmingham. There was an exceeding large number of visitors, and the specimens were numerous and good. The following is the list of prizes:—Auriculas. Premier: Ne plus Ultra, Mr. S. Bunn. Green-edged: 1st, Oliver's Lovely Ann, Mr. J. Britten; 2nd, Ploughboy, Messrs. Pope and Sons; 3rd, Lord Bridport, Messrs. Pope and Sons. Grey-edged: 1st, Ne plus Ultra, Mr. S. Bunn; 2nd, Conqueror of Europe, Mr. F. B. S. Flindell; 3rd, Conqueror of Europe, Mr. S. Bunn. White-edged: 1st, Taylor's Incomparable, Messrs. Pope and Sons; 2nd, Wood's Delight, Mr. Wallace. Self: 1st, Oddy's Rest, Mr. Wallace; 2nd, Lord Leigh, Mr. S. Bunn; 3rd, Mr. Wallace. Alpines: 1st, Lovely Ann, Mr. J. Haines; 2nd, Fair Rosamond, Mr. Wallace. Seedling: 1st, Mr. Coudrey; 2nd, Mr. Wallace. Sweepstakes for the two best, Messrs. J. Pope and Sons.—Polyanthuses. Premier: Mr. J. Coudrey. Dark Ground: 1st, Mr. J. Moore; 2nd, do.; 3rd, do. Red Ground: 1st, Mr. J. Haines; 2nd, Mr. E. Phillips; 3rd, Mr. Wallace. Seedling: 1st, Messrs. Pope and Sons; 2nd, do. Sweepstakes for the two best, Messrs. J. Pope and Sons.—Hyacinths: 1st, Goor Faust, Mr. Coudrey; 2nd, Constant Elizabeth, Mr. J. Moore, —Pansies: Best 12, Mr. T. Mellon; 2nd 12, Mr. E. Phillips; best 6, Mr. T. Mellon; 2nd 6, Messrs. Pope and Sons; best seedling, Mr. T. Mellon; 2nd do., do.—Orchidaceæ: 1st, Maxillaria Harrisoniæ, A. Kendrick, Esq.; 2nd, Oncidium luridum guttatum, do.; 3rd, J. Mason, Esq.—Stove Plants: 1st, Alphelandra cristata, J. Mason, Esq.; 2nd, Euphorbia splendens, Messrs. Pope and Sons; 3rd, Gloxinia maxima, A. Kendrick, Esq.—Greenhouse Plants: 1st, Chorozema Henchmanni, J. Mason, Esq.; 2nd, Tropæolum tricolorum, J. Mason, Esq.; 3rd, Clematis Sieboldi, Mr. P. Kenway.—Ericas: 1st, Mundula, Messrs. Pope and Sons; 2nd, Ardens, Mr. J. Coudrey.—Camellias. Double white, Mr. J. Moore; 2nd do., Mr. J. Moore.—Geraniums. 1st, Climax, J. Upfill, Esq.; 2nd, Seedling, J. Mason, Esq.; 3rd, Duchess of Devon, J. Mason, Esq.—Roses in Pots. 1st, Smith's Yellow Noisette, J. Upfill, Esq.; 2nd, Odorata, J. Mason, Esq.—Herbaceous or Frame Plants. 1st, Epimedium violaceum, Messrs. Pope and Sons; 2nd, Trillium grandiflorum, Mr. J. Moore; 3rd, Androsace carnea, Mr. J. Moore.—Orange or Lemon. 1st, Citrus aurantium, Mr. J. Moore; 2nd, Citrus aurantium, A. Kendrick, Esq.—Apples and Pears. Scarlet Pearmains, R. L. Chance, Esq.; Caulach Pear, do.—Cabbage. 1st, Nonpareil, Mr. J. Rodway; 2nd, do.—Broccoli. 1st, white, J. Mason, Esq.; 2nd do., R. L. Chance, Esq.—Lettuce. 1st, hardy green, Mr. J. Rodway.—Rhubarb. 1st, Myatt's Victoria, Mr. J. Mist, jun.; 2nd do., Mr. J. Moore.—Sea-kale. 1st, R. L. Chance, Esq.; 2nd, J. Mason, Esq.—Asparagus. 1st, Mr. W. Baker.—Cucumbers. 1st, A. Kendrick, Esq.; 2nd, J. Mason, Esq.—Forced Potatoes. 1st, R. L. Chance, Esq.; 2nd, J. Mason, Esq.—Salad. Best dish, J. Mason, Esq.—The following honorary prizes were also awarded:—Cineraria, H. W. Tyndall, Esq.; Azalea phœnicea, J. Mason, Esq.; Amaryllis formosissima, do.; Castor-oil plant, R. L. Chance, Esq.; Peas, do.; Rosa odorata, J. Upfill, Esq.; Camellia Colvilli, Mr. J. Moore.—Cottagers' Prizes. Mr. C. Lees, for Rhubarb; do., Salad; Mr. Cope, Pansies; do., Rhubarb, Mr. Brittle, Pansies; do., Nosegay; do., Double Crimson Primrose; Mr. Davis, Onions.

Cambridgeshire Horticultural Society.—April the 20th the first show for the present season took place at the Town Hall. The collection was very good: and though not extensive, some of the specimens were very beautiful. The Rev. A. Fitch presided, and awarded the prizes as follows: Four best Auriculas, green, grey, white, and self: Medal, Colonel Taylor, Ringleader, Taylor's Glory, Metropolitan, Mr. R. Headly; 2nd ditto, Metropolitan, Taylor's Glory, Page's Champion, Ringleader, Mr. Giddings; 3rd and 4th, (classed ad meritum,) Mr. R. Headly; 5th, Page's Champion, Taylor's Glory, Metropolitan, Haylock's Mrs. Childers, Mr. R. Haylock. Best Seedling Auricula: Mr. W. Gimson. Four best Polyanthuses: 1st, Alexander, Buck's George the Fourth, Prince Royal, Bang Europe, Mr. Giddings; 2nd, Mr. H. Green. Six best Hyacinths: 1st, Mr. R. Headly; 2nd, Mr. Green; 3rd, Mr. Ready. Three best pots of double Primroses: 1st, Mr. H. Green; 2nd, Mr. Giddings. Best Wallflower: 1st, Mr. Widnall; 2nd, Mr. F. B. Smith. Best Plant in bloom, in a pot: 1st, Rhododendron arboreum, Mr. Widnall; 2nd, Azalea Smithii, Mr. Biggs. Best Collection of Plants, exceeding 40: 1st, Mr. Widnall; 2nd, Mr. H. Green. Best Collection of Plants, not exceeding 40: 1st, Mr. Biggs; 2nd, Messrs. Hudson. Best Collection of Cut Flowers: 1st, Messrs. Hudson; 2nd, Mr. J. Newman. Best Basket of Vegetables: 1st, Messrs. Hudson, Medal; 2nd, Mr. J. Newman. Best Brace of Cucumbers, not less than 12 inches in length: 1st, Mr. Giddings; 2nd, Mr. R. Headly. Four best stalks of Rhubarb, not forced: 1st, Mr. R. Headly; 2nd, Mr. J. Newman. Best Basket of Salad: 1st, Mr. J. Taylor; 2nd, Messrs. Hudson.

Extra Prizes. Table Pears: 1st, Mr. Ready; 2nd, Beurré Rance, Mr. Pemberton. Baking Pears: 1st, Uvedale's St. Germain, Mr. Newman; 2nd, ditto, Mr. Pemberton. Table Apples: Cockle Pippin, Mr. Pemberton. Pansies: Mr. Widnall. Cottagers' Prizes, 2*s.* 6*d.* each. Best Wallflower: W. Clark. Best Cabbage: T. George. Best Lettuce: W. Clark. Four best Stalks of Rhubarb: T. George. Best 25 Radishes: W. Clark. Four best Baking Apples: W. Clark. Cottagers' extra Prizes. Broccoli: T. George, 2*s.* Radishes: E. Lawson, Bourn, 1*s.*—*Cambridgeshire Advertizer.*

Herts Horticultural Society.—On Thursday last the first meeting, for the season, of this society took place at the Shire Hall. The fineness of the day drew together a large number of the leading families of the county. The supply of plants and flowers, though on a limited scale, in comparison with other shows, was well made up in excellence of growth and profusion of bloom; the plants were also of the first-rate order. The contributions from the gardens of J. Warner, Esq., Hoddesdon, and W. R. Baker, Esq., Bayfordbury, were universally admired; the gardens of Earl Cowper and C. J. Dimsdale, Esq., also contributed their share to the excellence of the show. Mr. Paul, of Cheshunt, exhibited a specimen of Tropæolum tricolorum and Clematis azurea grandiflora; Mr. Francis, nurseryman, a collection of Hybrid Rhododendrons, of rich hues, varying between scarlet and crimson.—Pines: 1st prize, Mr. Browne, gr. to Lady Meux; 2nd, Mr. J. Dawson, gr. to Lord Melbourne.—Strawberries: 1st, Mr. Brown; 2nd, Mr. J. Dawson; 3rd, Mr. Tinsley, gr. to S. Adams, Esq.—Cucumbers: 1st, Mr. Brown; 2nd, Mr. Hamp, gr. to E. Chuck, Esq.; 3rd, Mr. Tinsley.—Apples, Dessert: 1st, Mr. Milne, gr. to C. S. Chauncy, Esq.; 2nd, Mr. Tinsley.—Apples, Kitchen: 1st, Mr. T. Dawson, gr. to Earl Cowper; 2nd, Mr. Plumbly, gr. to C. J. Dimsdale, Esq.—Specimen Plant: 1st, Mr. Plumbly; 2nd, Mr. Slowe, gr. to W. R. Baker, Esq.; 3rd, Mr. T. Dawson.—Greenhouse Plants: 1st, Mr. Slowe; 2nd, Mr. Plumbly.—Miscellaneous Plants: 1st, Mr. Williams, gr. to J. Warner, Esq.; 2nd, Mr. Slowe.—Geraniums: Mr. T. Dawson.—Cape Heaths: 1st, Mr. Plumbly; 2nd, Mr. Slowe.—Auriculas: 1st, Mr. J. Dawson; 2nd, Mr. J. Hudson.—Auriculas, Seedling: Mr. J. Hudson.—Polyanthus: 1st and 2nd, Mr. Williams.—Heartsease: Mr. G. Smith.—British Plants: 1st, Mr. Simmonds; 2nd, Mr. Sprigings.—Stove Plants: Mr. Slowe.—Orchidáceæ: Mr. Williams, gr. to C. B. Warner, Esq.—Cut Flowers: 1st, Mr. J. Williams; 2nd, Mr. Slowe.—Cottagers' Prizes; Fruit: 1st, James Farrow, of Tewin; 2nd, S. Tinsley.—Flowers: 1st, W. Cowler, of Wadesmill; 2nd, J. Farrow, of Tewin.—Vegetables: J. Farrow, of Tewin.

Extra prizes were awarded to Miss Hadsley, for Goliah Rhubarb; to Mr. T. Dawson, for Hydrangeas; to Mr. Plumbly, for a collection of Greenhouse Azaleas; and to Mr. Francis, for Hybrid Rhododendrons.—Miss England, of Hertford, exhibited some specimens of Artificial Flowers and Fruit, for which the Judges recommended the committee to present her with a medal.

Ratho Horticultural Society, April 29.—This society held its first meeting for the season in the Masons' Lodge, when the following prizes were awarded:—For the 4 best Hardy Shrubs: 1st, A. Forrester, gr. to D. Falconer, Esq.; 2nd, A. Gibson, gr. to J. M. Hay, Esq. Best 3 Auriculas: 1st, J. Pow, gr. to A. Berwick, Esq.; 2nd, H. Ritchie, gr. to S. Wilson, Esq. Best 3 Polyanthuses: 1st, A. Forrester; 2nd, J. Pow. Best 3 Double Primroses: 1st, A. Forrester; 2nd, J. Pow. Best 3 Tender Exotics: 1st, J. Thomson, gr. to H. Brown, Esq.; 2nd, D. Drummond, gr. to J. M. Melville, Esq. Best 3 Cinerarias: 1st, A. Gibson; 2nd, A. Vetch, gr. to J. Dundas, Esq. Best 2 Double Wallflowers: 1st, J. Pow; 2nd, J. Hogg, gr. to — Hawse, Esq. Best 4 stalks of forced Rhubarb: 1st, J. Pow; 2nd, G. Douglass, gr. to Sir A. Maitland, Bart. Best Broccoli: 1st, H. Ritchie; 2nd, A. Gibson. Best Early Cabbage: 1st, D. Ferguson, gr. to R. Nasmyth, Esq.; 2nd, J. Pow. Best 2 Leeks: 1st, A. Forrester; 2nd, D. Ferguson.—There was also a competition amongst journeymen for the best Kitchen Basket, when the 1st was awarded to W. Dickson, Ratho House; 2nd, D. M'Kenzie, Dundas Castle.—Amateurs. Best 2 Leeks: 1st, J. Bishop; 2nd, R. Craw. Best Cabbage: 1st, R. Craw; 2nd, C. Steward. Best German Green: 1st, C. Stewart; 2nd, J. Baxter. Best Herbaceous Plants: C. Stewart.

Warwick and Warwickshire Horticultural Society, April 28.—The first exhibition for the season took place at the Court House. The following is an account of the prizes:—Best six Greenhouse Plants, 1st prize, *amateurs,* Tropæolum tricolorum, T. pentaphyllum, Leschenaultia formosa, Erica vestita alba, E. hybrida, E. acuminata, H. C. Wise, Esq.; 2nd, W. H. Bracebridge, Esq. Best 6 do., *nurserymen,* Fuchsia corymbiflora, Azalea indica hybrida, A. phœnicea, Cineraria King, Erica vernix, E. coccinea, Mr. Barnes. 3 best do., *amateurs,* Amaryllis Johnsonia, Ixia tricolor, Kennedya nigricans, C. T. Warde, Esq. 3 best do., *nurserymen,* Tropæolum tricolorum grandiflorum, Azalea indica alba, A. Smithii, Mr. Barnes. Best single specimen, *amateurs,* Azalea indica alba, R. Jones, Esq. Best 12 Geraniums, *nurserymen,* Beauty of Ware, Mrs. Sweet, Fosteri roseum, Ada, Lord Hill, Joan of Arc, Sidonia, Gem, Fanny Garth, Jewess, Rosetta, La Belle Brunette, Mr. Barnes. Best 6 do., *amateurs,* J. Twamley, Esq. Best 12 Seedling Calceolarias, *amateurs,* Mr. W. Dunn, Hatton. Best 6 (Stocks) in pots, W. H. Bracebridge, Esq. Herbaceous cut flowers, Mr. Barnes. Basket of miscellaneous plants, do. Bouquet of wild flowers, Mr. W. Sutton. Pansies, stand of 36—May's Plenipo, Model of Perfection, Carlo Dolce, Victory, Diogenes, Egbaston Hero, Reliance, Princess Augusta, Peter Dick, Black Knight, Lady Sarah Ingestrie, Crimson Shakspeare, Dr. Johnson, Imogene, Prince of Wales, Manlin's Bathonia, Childe Harold, Jewess, Lady Flora Hastings, Vivid, Launcelot, Queen of Scots, Jehu, Maid of Loire, Angeline, Coronation, Marc Anthony, Bebronii, Lilac Perfection, Sovereign, Miss Hoare, Montjoy's Victoria, Rev. J. Stainforth, Marchioness of Bath, Prince Albert; Mr. Burbury. Pansies, stand of 24, Mr. Brownridge. Best 12 do., Mr. J. Burbury. Best Seedling do., Mr. Cattell. Best 6 Auriculas, *amateurs,* Wood's Lascelles, Pearson's Badajoz, Hughe's Pillar of Beauty, Taylor's Incomparable, Leigh's Bright Venus, Popplewell's Conqueror, J. Twamley, Esq. Do., *nurserymen,* Lancashire Witch, Duchess of Oldenburgh, Emperor Alexander, Page's Champion, Bright Phœbus, Smith's Waterloo, Mr. C. Kimberley. Best 3 Auriculas, *amateurs,* Thorneycroft's Invincible, Wood's Lascelles, Popplewell's Conqueror, J. Twamley, Esq. Do., *nurserymen,* Hodges' Britannia, Warris's Blucher, Duchess of Oldenburg, Mr. C. Kimberley. Best 12 Tulips, Earl of Warwick. Best 3 Stove Plants, Euphorbia jacquiniflora, Eranthemum bicolor, Vinca rosea, W. H. Bracebridge, Esq. Best single specimen, Euphorbia splendens, C. T. Warde, Esq. 1st Strawberries (Keen's Seedling), 4 oz., W. H. Bracebridge, Esq. 2nd do., do., 4 oz., C. T. Warde, Esq. Grapes, Black Hamburgh, Mr. Persac. Best 6 Dessert Apples (Nonpareil), C. T. Warde, Esq. Best 6 Culinary do. (Hanwell Sourings), Mr. Carpenter. Best 6 Dessert Pears, Hon. C. B. Percy. Best brace of Cucumbers (Black Spine), J. Goodhall, Esq. Asparagus, 25 heads, Mr. W. Sutton. Cabbage, 4 heads, Mr. Smith. Rhubarb (Victoria), 6 stalks, W. H. Bracebridge, Esq. French Beans, C. T. Warde, Esq. Best dish of 20 Potatoes (Ash-leaved Kidney), do. 2 do. (Fox's Seedling), W. H. Bracebridge, Esq. Lettuce, 3 heads, Mr. Cattell, Broccoli (Miller's Impregnated), 3 heads, Mr. W. Sutton. Mushrooms, dish, C. T. Warde, Esq. Sea-kale, 6 crowns, do. Extra Prizes.—12 Seedling Calceolarias, H. C. Wise, Esq. Citrons in pots, C. T. Warde, Esq. Stove Plant, Earl of Warwick. Provence Roses, in pots, W. H. Bracebridge, Esq. Basket of Plants, Mr. Brownridge. Do. of Vegetables, J. Fullerton, Esq. Cottagers' Prizes.—Cabbage, 4 heads, J. Gibbs. Salad, Thomas Box. Broccoli, J. Gibbs. Plants, in pots, J. Webb. Extra.—Salad, W. Knibb. Rhubarb, do. Hon. C. B. Percy's prize, for 6 Auriculas, in pots, J. Gibbs, Warwick. Mr. Phillips, Priory Gardens, contributed a collection of plants, comprising some well-grown Ericas. Mr. Pope, of Birmingham, sent some good Auriculas; there was also a magnificent Pine, from Mr. Butcher, of Stratford-on-Avon.

MISCELLANEOUS.

Manures.—Under the name of Geine the American editor of Liebig's Organic Chemistry comprehends "the mass of nutritive matter which soils and composts afford." In this sense it has a much more extensive signification than humus, and may be considered equivalent to "organisable matter," a favourite expression of the late Mr. Knight, and to our ears much more agreeable than geine. Concerning the mode of preparing a *solution of this geine* and its effects, we have the following information:—'Boil one hundred pounds of dry, pulverised peat with two and a half pounds of white ash (an article imported from England), containing 36 to 55 per cent. of pure soda, or its equivalent in pearlash or potash, in a potash kettle, with 130 gallons of water; boil for a few hours, let it settle, and dip off the clear liquor for use. Add the same quantity of alkali and water, boil and dip off as before. The dark-coloured brown solution contains about half an ounce per gallon of vegetable matter. It is to be applied by watering grain crops, grass lands, or in any other way the farmer's quick wit will point out. In the month of June, I prepared a solution of geine, (says Mr. Nichols,) obtained, not by boiling, but by steeping the mud as taken from the meadow in a weak lye in tubs. The proportion was about—peat 100lbs., potash 1lb., water 50 gallons; stirred occasionally for about a week, when the dark-brown solution described by Dr. Dana was dipped off and applied to some rows of corn, a portion of a piece of starved barley, and a bed of onions sown on land not well prepared for that crop. The crop of barley on the portion watered was more than double the quantity both in straw and grain to that on other portions of the field, the soil and treatment of which were otherwise precisely similar. In June four rows (of the onions) were first watered with the solution of geine. In ten days, the onions in these rows were nearly double the size of the others. All but six rows of the remainder were then watered. The growth of these soon outstripped the unwatered remainder. Eventually the whole piece was watered with the solution, excepting the ends of some of the rows, which produced only very small onions; and had it not been done, Mr. Nichols believes that not a single bushel of a good size would have been produced. The onions when measured, making ample allowance for the tops, which had not been stripped off, were adjudged equal to four bushels to the square rod, or at the rate of 640 bushels to the acre." Dr. Dana, the author of the foregoing extract, differs from Berzelius in his opinion that lime and ashes act alike as converters of mould into soluble matters which serve as food for plants. He "considers the practice of mixing lime with peat as the worst that can be followed, because a compound is formed of little solubility, viz. geate of lime. He recommends the ley of wood-ashes, which gives a dark-brown solution, the alkaline properties of the lime are neutralised, and a large quantity of water is absorbed." In another place we find the following interesting statements regarding the mode of rendering *peat* useful as a manure:—"According to Dr. C. T. Jackson, a compost made of three parts of peat and one of stable manure is equal in value to its bulk of clean stable dung, and is more permanent in its effects. Dr. Jackson deems it essential that animal matters of some kind should be mixed with the peat, to aid the decomposition and produce the requisite gases. Lime decomposes the peat, neutralises the acids, and disengages the ammonia. The peat absorbs the ammonia, and becomes in part soluble in water. The soluble matter, according to Dr. Jackson, is the apocrenate of ammonia; crenate of ammonia and crenate of lime being also dissolved. With an excess of animal matter and lime, free carbonate of ammonia is formed. The peat should be laid down in layers with barn-yard manure, night soil, dead fish, or any other animal matter, and then each layer strewed with lime. In Dr. Jackson's report, he has presented highly valuable results from the use of this compost, which deserves the attention of every agriculturist. He gives the following details of the manner in which the compost was prepared upon the farm of Mr. Sanford, near the village of Wickford, in North Kingston. 'In the corner of the field a cleared and level spot was rolled down smooth and hard, and the swamp muck was spread upon it, forming a bed eight feet wide, about fifteen or twenty feet long, and nine inches thick. For every waggon-load of the muck one barrel of fish was added, and the fish were spread on the surface of the muck, and allowed to become putrescent. The moment they began to decompose, he again covered them with peat, and a renewed layer of fish was spread and covered in the same manner. The fermentation was allowed to proceed for two or three weeks, when the compost was found to have become fit for the land. To this he was advised to add lime in the proportion of one cask to each load of compost early in the spring, which it was supposed would complete the decomposition in two or three weeks. Such a heap should be rounded up and covered, so as to prevent the rain washing out the valuable salts that form in it. And in case of the escape of much ammonia, more swamp muck or peat should be spread upon the heap, for the purpose of absorbing it.' Dr. Jackson is of opinion that the phosphoric acid of the peat and animal matter would convert the lime into a phosphate, and thus approximate it very closely to bone manure. Any refuse animal matter can be of course employed in a similar manner. 'The carcass of a dead horse, which is often suffered to pollute the air by its noxious effluvia, has been happily employed in decomposing 20 tons of peat earth, and transforming it into the most enriching manure.' Night soil may be composted with peat with great advantage, sufficient lime being added to deprive it of odour; large quantities of ammonia are given off and absorbed."

Grafting the Mistletoe.—The following account of grafting the Mistletoe is given by Mr. Moss, a nurseryman at Malvern, near Worcester. "The best stocks for the purpose are young Apple and Pear-trees. The grafts should be put on in the first or second week in May; they should never be nearer the ground than 5ft., nor higher from it than 10. The operation is very simple; where the graft is not more than half an inch in diameter, an incision is made in the bark, into which a thin slice of Mistletoe is inserted, having a bud and leaf at the end. In grafting longer pieces, a notch should be cut out of the branch, the incision made below the notch, and a shoulder left on the graft to rest on the notch, in the manner of crown-grafting. It must be observed, that the spaces between the joints will not do for grafting; there must be a joint let into the back of the stock. About the middle of May is the best time for budding, and the operation differs in retaining a heel of wood, below the bud, for insertion."—*Loudon's Arboretum Britannicum*, vol. iv. p. 2571.

Rural Sonnets.—From Miscellaneous Poems by Mr. J. Jones, of the Inner Temple, author of "Spartacus," "Regulus," and other Tragedies:—

MAY.

Thrice welcome, genial month! whose balmy wing
  Fans into full developement the show
Of blossoms which, around, their splendours fling,
  And, in the vivifying sunlight, glow.
Thou, on life-stirring odours, dost carouse;
  And thine are robes immaculate to wear,—
The milk-white favours of the cherry-boughs;
  The dazzling promise of the luscious pear.
The pink-eye'd apple-cup thy reign prolongs—
  The daisies' sheen—the tulips' pick'd display—
The hawthorn-hedge, alive with gushing songs—
  The lilacs' plum'd—the chesnuts' trim array—
Nature, for glee, holds festival, as thou,
The garland-graces' queen, with blooms bedeck'st thy brow.

JUNE.

The tender fruits unfolding to the sun,
  To drink its beams, and hive their vital pow'r,
Delightful May, her Spring-time mission done,
  Marries with June, and seeks their Summer bower.
Now, the laburnums flaunt their golden chains,
  Plants, shrubs, and trees, in varying hues are bright;
The cuckoo's note re-echoes through the plains;
  The nightingale keeps musical the night;
The bee is roving, humming as he goes,
  O'er full-blown pæonies in crimson pride,
Where waves, in fragrant pomp, the garden rose,
  White as her robes, or blushing as the bride!
The grasses are in flower; and, now, the heats
Urge to the bubbling rills, and spread the new-mown sweets.

JULY.

The clean-rak'd fields resume their green attire;
  The flocks, close-shorn, o'er downs and meadows stray:
Men, birds, and beasts, to coverts calm, retire;
  Nature respires, by night; and pants, by day.
The stately swan, to shun the noon-tide blaze,
  On lake and river in their isles or creeks,
Leading her cygnets to their verdant maze,
  The breezy shade and grassy coolness seeks.
The foremost fruits are tempting ripe, to treat
  The present thirst, or pile their fragrant wreath;
Currants, and berries rich, and cherries sweet,
  A vintage that invigorates the health!
While pungent scents of lavender, and flowers,
Ma Mignonne—Eglantine—revive the drooping hours.

AUGUST.

The scarlet poppies skirt the ripening corn;
  The zephyrs wave its masses like the sea;
The tiny rustic sallies, with the dawn,
  To keep, from pilfering birds, the produce free.
The Sun's own flower, its oriflamb display'd,
  Turns with the Day-god's triumph through the spheres;
The Lady's bower, in jessamine array'd,
  The Lady there—most beautiful appears!
The early apple now, and now the pear,
  Make orchard trees luxuriant to the sight;
The asters glisten in the gay parterre;
  The varied marigolds expand in light.
And now, the reapers toil—the sheaves are bound—
The harvest wains drag home—feasting and songs go round.

SEPTEMBER.

Weave us a thousand dahlias into one,
  Bold the device, and rare its radiance be,
Serve us a banquet; long before the sun
  Go down, in molten rainbows, to the sea.
Velvet the lawn of fountains where 'tis spread,
  Sweet with clematis every near alcove,
And let September's horn of plenty shed
  Its choicest stores, to music from the grove.
Pine-apples bring, and plums of various hue,
  Peaches, the elixir of the solar beams,
The fruit that melts in nectar, and the dew
  With which the grape, gold-green, or purple, teems.
While tints autumnal soothe us, and the breeze,
Unwoo'd on stubble lands, glides dancing through the trees.

Whale-oil Soap.—From a communication of Capt. Randall to the Massachusetts Agricultural Society, we learn that the application of whale-oil soap is a good preventive of the attack of the borer (Cossus ligniperda) upon apple or other trees. The manner in which Capt. Randall uses the whale-oil soap is as follows: eight to ten pounds of whale-oil soap are put into a common pail, to which a sufficient quantity of warm water is added, so that when well mixed together, the whole is about the consistence of good thick paint. With this pail of soap, thinned in this manner, the man, having a small tin pail, or bag, or pocket, filled with fine sand, tied round his waist, with a coarse crash cloth, and a paint-brush, is ready for operations. He first wets his cloth with soap, then scatters on some dry sand, and gives the trunk and branches a good rubbing; after which, with a hand-brush, he puts on a coat of the soap, prepared as above, equal to a thick coat of paint. The time selected for the operation is just at the termination of a storm of rain, when the moss, or any roughness on the bark, will yield more readily to rubbing. From the size which it is stated the trees have acquired in four years, we would particularly invite the attention of cultivators to the above method of applying the whale-oil soap, not only to the Apple, but to all kinds of fruit trees.

Roses.—A lecture on these flowers, their variations, and the natural relation they bear to other plants, was delivered last Wednesday, at the Royal Institution, by Professor Lindley. On this occasion, an abundance of beautiful forced Roses was supplied by Messrs. Lane and Co., of Great Berkhampstead.

Habit of Chloræas.—As a species or two of this beautiful genus of terrestrial Orchidaceæ from Chili exist in our gardens, the following extract from a letter from Mr. Bridges, who has been travelling in their country, published in the "London Journal of Botany," may be useful to some of our readers. "These plants, when introduced into England, will prove, I am sure, great favourites; being easy of cultivation, and only requiring to be kept without water for several months after flowering, so as to imitate the dry season, and enable their tubers to ripen. I am now acquainted with about twenty species, and have sent home a quantity of the roots of six species."

GARDEN MEMORANDA.
